I would like to thank Professor John Travis Marshall (Georgia State University College of Law) for encouraging me to pursue this project, and for his time, dedicated mentorship, and valuable feedback. I am also indebted to Michael Lucas (Deputy Director, Atlanta Volunteer Lawyers Foundation) for helping me brainstorm at the initial stages and for his insight into barriers faced by tenants or potential clients. Our conversations helped me cross-reference how my research would be applied in real-time. Finally, I should thank Dr. Leslie Rubin and the "Break the cycle" team of esteemed mentors for their thoughtful comments during the development phase, prior to the conference presentation, and for detailed feedback on drafts of this manuscript.

Chapter 64

CHILDREN'S HEALTH AND SAFETY RISKS POSED BY IRRIGATION WATER IN NORTHERN UTAH

Kristen R. Koci*, BS and Courtney G. Flint, PhD

Department of Sociology, Social Work, and Anthropology,
Utah State University, Logan, Utah, USA

ABSTRACT

In Northern Utah communities, irrigation water runs through city streets and is used for residential purposes, posing a potential risk to children's health and safety. Children may be exposed to these waters in various ways, including through gardening, play, ingestion, or other unintentional contact. These waters are typically not treated and may contain potentially harmful contaminants. In this chapter we explore perceptions of health and safety risks children may face when exposed to irrigation water in Logan, Utah and surrounding areas. A qualitative analysis was employed for this study. Specifically, semi-structured interviews were conducted with key stakeholders in the area (N=13) to assess local and scientific knowledge and risk perceptions on water quality, health risks, and safety risks associated with the urban irrigation system. Members of the scientific research community expressed concern that irrigation water may expose children to various health and safety risks, and that children of a lower socioeconomic status may experience more exposure pathways and have greater levels of vulnerability. Conversely, civic stakeholders expressed a lack of concern about health risks from irrigation. Strategies are identified to remedy divisions in perspectives on children's health and safety risks and break the cycle of vulnerability.

INTRODUCTION

Children possess a distinct vulnerability to environmental hazards that may result in negative consequences for their health and safety. From a general environmental health standpoint, children have greater sensitivity to harmful chemicals due to their unique physiology and behavior patterns [1-4]. Additionally, children are more vulnerable to unintentional injuries than adults, including drowning, which is the leading cause of death for children between the ages of 1 and 4 years [5].

One environmental factor that may pose considerable health and safety risks for children is irrigation water. Irrigation waters are used in areas throughout the United States for various residential and agricultural purposes. In Utah, irrigation water is managed by over 1,000 irrigation companies who handle farms' and households' access to irrigation water throughout the state (from single neighborhoods to thousands of acres) [6]. Irrigation waters in Utah are sometimes piped directly to households for residential irrigation use, though they may also flow through town in open canals and ditches or through the gutter system to be used for residential landscaping or more widespread agriculture. Irrigation water is not treated to the same standards as drinking water, if indeed it is treated at all, and often varies in quality based on location and source [7]. Additionally, irrigation water often gets less attention than drinking, waste, and recreational waters, leading to a lack of appropriate monitoring of irrigation water quality [7]. However, a report issued by the Utah State University Foundation, and in partnership with the Federal Water Pollution Control Administration, stated that the major contaminants of concern commonly found in irrigation water include soluble mineral constituents, fertilizers, nitrate, pesticides, and in some cases, treated wastewater [8]. As such, irrigation waters may pose considerable risks for children's health and safety when exposure occurs, and there are multiple potential ways children could be exposed to these waters (including through play, gardening, ingestion, and other unintentional contact). Figure 1 shows a picture of children playing in irrigation water flowing through a street gutter in Logan, Utah.

Considering that surface waters are most often used for irrigation and are open to a broad range of potential contamination, researchers have examined the quality of these waters world-wide [9]. Most of these efforts are focused in the developing world, though there are some studies that examine these issues within a US context. One such study examined the quality of waters in irrigation reservoirs and canals in Ohio [9], finding total coliforms in all water samples and *E. coli* in most collected water samples. A study examining surface water quality in an agricultural watershed of Louisiana found that sediment, phosphorus, nitrogen, dissolved solids, and acidity/alkalinity were the most important factors associated with poor surface water quality in this watershed [10]. While these studies focus on irrigation water quality, additional studies have also discussed human health in relation to decreased water quality. For example, Gilliom et al. [11] found that pesticides and herbicides pose the most significant concern for human health, especially those found in urban streams and rivers. Other studies have provided suggestions for the best way to monitor irrigation water quality [7, 9].

Figure 1. Children playing in irrigation water flowing through a street gutter in Logan, Utah (Photo by C. Flint with permission from parent).

Previous studies on irrigation water quality and related risks, while valuable in their contributions, are sparse. In general, there is not much information available on the quality of irrigation waters and potential risks to local populations. More extensive knowledge on the quality of irrigation water is needed to better understand associated risks to those exposed to it, especially for children due to their increased vulnerability and contact with these waters.

In addition to sparsity, the extant research on irrigation water exposure is limited in several ways. Previous research does not specifically address safety-related risks that may occur due to human access to open irrigation water sources such as open ditches and canals, and it neglects to account for health and safety risks specific to *children* exposed to these waters. Further, existing research explicitly focuses on microbial risk assessment, failing to account for the social dimensions of risk that may exist. Specifically, this research fails to account for the ways that local populations *perceive* issues of health and safety risk due to irrigation water exposure. While analyzing the quality of and specific harmful constituents in irrigation water is undoubtedly of great importance, it is equally important to understand water risk perceptions to better comprehend the complexity of the issue. Beyond research on levels of contamination within irrigation water, local perceptions of risk from irrigation water exposure may differ from those expressed in scientific settings and may influence broader community awareness and concern for these issues [12]. Additionally, vulnerabilities experienced on an everyday basis contribute to environmental risk situations that are socially constructed in various and potentially conflicting ways among community residents [13].

This study addresses perceptions of risk related to children's irrigation water exposure in Northern Utah by focusing on the following broad questions: 1) Are there perceived health and safety risks for children exposed to irrigation water in Northern Utah and 2) If so, are there ways to minimize these risks? Additionally, this research seeks to provide a deeper understanding of the ways that perceptions of risk are constructed within certain social

contexts and how this could influence levels of concern surrounding issues of risk within communities [12].

OUR STUDY

This study was conducted in Northern Utah, with a predominant focus on the City of Logan. Logan, Utah is the largest city in Cache County. Based on US Census 2017 statistics, Logan has an estimated population of 51,115 [14]. In terms of race, the city's population is predominantly non-Hispanic or Latino white (75.4%) [14]. The Hispanic or Latino population makes up 15.5% of the local population, followed by individuals of Asian origin (4.2%) [14]. In terms of age, 24.1% of Logan's population is under 18 years of age, and 9.2% of the population is under 5 years of age [14]. Some statistics for Logan are skewed by the presence of a large student population in the city (considering that it is home to Utah State University). For example, only 40.5% of the population owns their home and 25.4% are classified as living in poverty [14].

Semi-Structured Interviews

Semi-structured interviews were conducted with 13 key stakeholders from the area who represent various local social fields. Local social fields are groups of people in local settings that represent different identities and interests [15]. Local social fields may make up a community field when the perspectives of each field converge toward locality-based action for the common good [15]. Key stakeholders interviewed for this study who represent local social fields include university researchers whose work focuses on water and water quality, individuals affiliated with University Extension (a program providing state-wide services and outreach connected to land grant universities), city officials, state government officials, individuals associated with local irrigation systems, and individuals affiliated with other community organizations. These stakeholders fall into two main categories: 1) university informants (university researchers and individuals affiliated with Extension) and 2) civic informants (city officials, state government officials, individuals associated with irrigation systems, and individuals affiliated with community organizations). In total, six university informants were interviewed (three university researchers and three individuals affiliated with Extension) and seven civic informants were interviewed (two individuals affiliated with irrigation systems, two state government officials, two city officials, and one individual affiliated with a local community non-profit organization). While these stakeholders represent distinct social fields, it is important to note that they also overlap. In other words, individuals affiliated with one social field (such as city government) may also be affiliated with other social fields (such as community organizations and irrigation systems). Many stakeholders are also local residents in the study area. Figure 2 shows the local social fields represented in the study and the number of informants interviewed within each field.

Interviewees were selected via criterion and snowball sampling. An initial list of interviewees was compiled based on known connections to irrigation systems and/or irrigation water quality. Individuals selected for the study were invited to participate via

email. During each personal interview, interviewees were asked to identify additional individuals who they thought may provide relevant information on the topic. These individuals were contacted and invited to participate in the study as well. Interviews lasted approximately 30-45 minutes. Most interviewees agreed to have their interviews recorded. Notes were taken during all interviews and recorded interviews were transcribed for subsequent thematic analysis. The interview process continued until data saturation was reached and interviewees began to consistently refer us to individuals already contacted.

Figure 2. Social fields represented in the study and the number of informants interviewed within each field. Asterisks (*) represent points of overlap. Adapted from Theodori [15].

Interview transcripts were analyzed to assess perceptions on children's health and safety risks due to irrigation water exposure, and efforts made or suggested to address these issues. Interviewees were initially asked to discuss their role in the city or organization they are affiliated with, and their involvement with irrigation water or irrigation systems. Next, they were asked several questions focused on water quality and safety risks associated with the urban irrigation system, water risk communication efforts by area authorities, and associated links to children's environmental health vulnerability. All interviewees were asked how they believe capacity can be built within the existing systems to break the cycle of identified or potential health and safety risks for children exposed to irrigation water now and in the future. While Logan was the city of focus in this study, some informants provided answers to the above questions from a vantage point beyond this study area. For example, some informants discussed these issues from a broader county (Cache County) or regional (Northern Utah) focus.

FINDINGS

Study findings are discussed below organized by four main themes: 1) identified contaminants of concern in irrigation water; 2) perceived health and safety risks for children exposed to irrigation water; 3) perceived risks for disadvantaged populations and 4) strategies for breaking the cycle of risks to children posed by irrigation water.

Contaminants of Concern

When asked about specific contaminants that may be present in Northern Utah irrigation water, some informants – most notably university informants – reported concern for potentially harmful contaminants introduced into irrigation water through runoff from streets, fields, and agricultural lands. One university informant expressed considerable concern for how there is little to no treatment of these waters:

“I guess the biggest concern about irrigation water in general, depending on where it comes from, there may be no treatment whatsoever of it. In fact, there’s very little treatment ever. So, I’m thinking again about the place where Hyrum gets their water. If there are people camping or – well, I guess it’s primarily camping – or a place like at rest stops where there might be a problem with waste treatment systems up there, there’s a pretty good potential for those sources to impact that irrigation water. I know, for example, we have Giardia up in Logan Canyon from backpackers and hikers and so on. So, any of that irrigation water that might have been infected by that contaminated stream water from sources of human camping, hiking, fishing, stuff, that’s going to have no treatment whatsoever.”

Some specific contaminants identified by university informants that may be in irrigation water include agro-chemicals (such as pesticides, herbicides, and fertilizers), pathogens (bacteria or other microorganisms that could cause disease in humans), animal materials, and human contaminants from recreation. One university informant said “...(D)efinitely if the water is traveling in uncovered canals, there is unlimited exposure potential and unlimited contamination potential.” Another university informant said:

“We actually had a situation in Smithville Canyon where there was a raccoon that got into the water storage tank and died. So, there was high levels of bacterial contamination, if there were any diseases that raccoon had, there was a potential. So, even things like that where animals just fall in and die and decay, there’s a potential of risk from that as well.”

Additionally, a university informant suggested that maintenance of irrigation canals can introduce potentially harmful chemicals into irrigation water:

“We also have the maintenance of the canals themselves which, ironically, produce some of the worst chemicals. So, we have the people that manage these ditches, they call this stuff moss – it’s a growth that happens in these unlined canals. They used to throw xylene on them... I don’t know what the current practice is, that was when I first arrived. So, they would simply tell the people near the ditch that if it’s running milky colored, don’t use it. But kids play in these ditches all the time.”

While some university informants were unsure whether identified contaminants exist at high enough levels to cause significant negative health effects, they expressed the critical

need for greater concern and research on the topic to determine the specific contaminants in irrigation water and if the levels of these contaminants are harmful to human health.

Perceived Health Risks

After discussing contaminants that may be present in irrigation water, informants provided their perspectives on children's health risks due to irrigation water exposure. University informants expressed a general concern for children's health, specifically perceiving that exposure to irrigation water may lead to risks from ingestion and other physical health-related issues. One university informant explained why children are at a higher risk for health-related issues from exposure to irrigation water than adults. This informant described how children have a lower tolerance for fighting off bacteria than adults and do not need to be exposed to as many infectious organisms as adults to become sick, specifically saying:

"So, a couple of things. The dose, the infectious dose, is typically based on body weight and so they [children] don't need as many infectious organisms that they're exposed to in order for them to get a disease. That's an issue, certainly, because of their size. They also tend to be, kids tend to be less worried about eating dirt. Pica's an issue, so if there's organisms or contaminants that absorb to soils, then they can get higher doses than adults would normally get because of ingestion of the solids. So, yeah... the exposure routes and the infectious dose are much, much more for the kids because of their body weight, higher surface area to volume through skin, those sorts of things. When I think of routes of exposure, I'm thinking of inhalation or dermal exposure or ingestion... (T)he kids are the ones that are primarily going to be running in the sprinklers and drinking that water. So, their potential... well, it could be in the canals. So, if canals are there, kids can jump in them and play in them and so on, but once the water gets to the user, the water that's sprayed or sprinkled or whatever, then the kids are going to tend to have higher exposures. They tend to be worried less about skin exposures. They're going to drink the water, they have the larger surface area to body mass ratios because they're smaller, they worry less about drinking the water, and all of those kinds of things. So, yes. Certainly, the exposure, the potential duration, and number of exposures for the kids are going to be higher."

Other university informants explained specific ways children may become sick from irrigation water exposure. Some examples of responses include:

"I mean, it's not treated. So, then you're looking at potential gastrointestinal issues... So, if it's piped or pressurized, there's still that health risk of ingesting that water and it hasn't been treated to drinking water standards. I mean, in this country, our tummies and guts are not equipped to deal with bacteria and things..."

"I think the pathogens are the ones I'd worry most about. You know, just because you not only have animals, but you also have potential for septic systems to drain into these [irrigation systems], especially the older ones. Exposure to fecal matter is never a good thing, you know. So, I think that's probably the biggest risk."

While university informants suggested there is a potentially significant health risk for children exposed to irrigation water, civic informants generally did not believe a health risk exists – at least not one of concern. When asked if they believe there are any health risks associated with children's exposure to irrigation water, civic informants responded in the following ways:

"You know, I honestly don't. Again, maybe I'm misinformed, but that's the honest answer. I don't really see that as a problem here."

"Not that I would be openly concerned about. I mean, if there's an outbreak in the water, that's a different story... (W)hen I grew up, it [the irrigation water] was water from the creek that had been diverted upstream and was run through this ditch and then flowed back in the creek. So, it was part of creek water which was, you know, it was clear water. It wasn't muddy, it wasn't real contaminated. We just had a lot of fun playing in it."

"I mean, we're a society of cleaning ourselves up and it can almost be debated both ways whether that's good or bad because if I'm too clean, any bacteria gets me sick and if I'm a little dirty, I can handle those bacteria and germs and things like that. So, I don't know where I stand on that. It's always a potential. It's a problem when you have outbreaks and, to me, an outbreak's more than, I don't know, 20 or 30 – a larger number."

As exemplified by the above discussion, there is a significant divide between perspectives of university informants and civic informants about children's health risks due to irrigation water exposure. University informants perceived a potentially significant health risk and civic informants perceived little to no risk at all. Furthermore, not only did civic informants rarely mention health risks, they more commonly expressed placing a high value on the irrigation water. Civic informants expressed sincere appreciation for irrigation water and consistently spoke of fond memories regarding their experiences with these waters:

"...(W)e irrigate with it around my house exclusively. So, my lawn, my garden, about a half an acre of property. I'm grateful to have it based a lot on cost. I mean, I pay like 12 bucks a month for it no matter if I use none or as much as I want. It's not metered; I just pay for a flat fee. So, it's really neat. Of course, I don't like to waste water either, so I don't over-irrigate. But my kids play in it, you know. They love to. You know, kids like to play in sprinklers and water in the summer, so they'll run through the sprinkler or put the sprinkler under the trampoline and jump on that. I've done it with them too, it's pretty fun. Nobody thinks about the water quality really."

"Growing up next to a ditch my whole childhood life, I really had a lot of fun and honestly it was a big part of growing up and being a kid. I mean, climbing in the ditch and getting wet and throwing moss around, and getting muddy and that kind of stuff—it was a lot of fun."

"That canal that I mentioned to you about that failed? People used to float that all the time. I've floated it and it was really fun. It was cold water, but it was really fun to do that and that's no longer an option."

Perceived Safety Risks

After discussing potential health risks, informants were asked whether they believe there are any safety risks associated with children's exposure to irrigation water. Both university and civic informants expressed concern for safety-related risks. University informants suggested many specific ways that exposure to irrigation could produce safety-related risks, saying things like:

"I think probably kids playing in it is the biggest risk. And, you know, just drowning. We have a remarkably laissez-faire attitude about kids being near the water. It just breaks my heart when people go camping with a little kid by the river and, 'we just took our eyes off for 30 seconds.' 10 seconds, 5 seconds is all it takes for a kid to fall into the water and then they're gone."

"So, a small child could easily drown in a canal. Easily. In addition, the water tends to be very cold, so there's a risk for hypothermia. And those are just physical risks. That's completely putting aside whether or not they might ingest that water. I mean, it's not treated."

"I mean, cars run into those canals too. People drowned, and kids get in the culverts and get sucked through the inverted syphon or something."

Civic informants also expressed concern for children's safety due to irrigation water exposure. When asked, "Do you believe there are any safety risks associated with open canals and ditches?" some civic informants replied:

"Yeah, I always worry about that. And again, you know, that was one argument for covering them. Some of the canals they've done liners on, so they're a little slippery on the edges and it's like, "what if a kid gets in?" ... It's always a risk."

"Oh yeah! Absolutely! I mean, you talk to the Bear River Canal Company in Box Elder county – they irrigate 70,000 acres and they have 2 major canals and they're open, you know. People play in them and swim in them and whatever, but people have drowned in them. They drowned last year in one of Bear River Canal Company's canals. So, the conveyance system – typically these irrigation companies are using these open canals and ditches because that's what they put in a hundred and fifty years ago."

Both university and civic informants also consistently referred to an instance where a "hundred-year-old" canal failed in Logan, Utah, and described how these sorts of scenarios introduce unique safety risks for children and adults alike. One informant explained the event as follows:

"They piped it finally, but there was a canal at the edge of USU [Utah State University] and above the Island and it was failing. They had knowledge it was failing. There were little mudslides here and there, but someplace it broke. When that starts happening it dissolves the hill away and you get a mudslide before you realize the canal's failing. It came right down on top of this little house right down in the Island and killed a mother and her 2 children. Certainly, these were low-income people living in this place. It was heart-breaking. That's a maintenance issue. The canal company and university and city people were fighting over this for years rather than fixing the damn thing. It's your problem, no it's your problem, no it's your problem, and it never gets fixed. They just argued over who was going to pay for it and when they did finally fix it [after the mudslide], they put it into a pipe. The pipe sometimes breaks now too, so, water's funny that way."

Perceived Risks for Disadvantaged Populations

In addition to providing perspectives on general health and safety risks for children exposed to irrigation water, university informants suggested that there could be unique risks for socially and economically disadvantaged populations. One university informant suggested that children who are more disadvantaged are more at risk. This informant specifically stated:

"I will note that it's the children who are poorer or in socially disadvantageous situations, meaning they have maybe parents that aren't as educated, or their diet is not as good as a wealthier family, who are more at risk. If we have a relatively poorer community where we have these children who encounter the water more and, also, maybe their health status isn't as good as we would like, it's incumbent upon us to protect them as best as we can. So, there is a demographic and socioeconomic aspect of this work..."

Another university informant proposed that children in rural areas are more at risk for health and safety risks due to irrigation water exposure, saying:

"We have kind of a laissez-faire attitude about this kind of stuff. So, in terms of social justice and economic stuff, it would be kids out in rural areas that [are exposed more]. You know, when I was a kid, I remember playing in the irrigation ditches because it was fun! I can't imagine kids are any different here."

Strategies for Breaking the Cycle of Risks to Children Posed by Irrigation Water

Interviews revealed a combination of factors that collectively create vulnerability to environmental risks posed by irrigation water. The combined influences of personal characteristics (including increased susceptibility to injury and disease, limited communication ability, and limited education), environmental characteristics (including lack of regulation for irrigation water treatment, access to both open and piped irrigations waters, and exposure through ingestion), environmental risk factors (including exposure to pathogens, agro-chemicals, and human and animal contaminants), health risk factors (including skin irritation and gastrointestinal issues), and safety risk factors (including potential for injury and drowning/death) contribute to the cycle of children's irrigation water-related risks that result in compound risk factors including potential long-term health effects and prolonged issues from injury, limited communication, limited educational services, and limited regulatory policy. While this cycle of children's irrigation water-related risks may appear disheartening, university and civic informants alike suggested numerous strategies during interviews that could be implemented now, and in the future, to mitigate and break the cycle of children's health and safety risks posed by irrigation water in Northern Utah. University informants suggested strategies such as:

- Raising the general level of awareness and informing the public about potential irrigation water risks
- Increasing the general concern about the use of irrigation water and risks that may associated with it
- Communicating with the public about appropriate ways to use the water
- Piping and pressurizing open irrigation waters

Figure 3. The cycle of irrigation water-related environmental health disparities among northern Utah children and strategies to “break the cycle” (stars) as suggested in interviews. Adapted from <https://www.isdd-home.org/break-tp>.

In addition to those strategies suggested by university informants, the most consistently suggested strategy proposed by civic informants to break the cycle of children's irrigation water-related risks was fencing off open irrigation canals. Figure 3 shows the array of children's health and safety vulnerabilities illuminated in this study and some strategies informants proposed to break the cycle of this type of children's environmental health problem.

DISCUSSION

As exemplified in the discussion above, perceptions of children's' health and safety risks posed by irrigation water in Northern Utah, especially regarding health risks, are divided between university and civic informants. University informants suggested health risks from irrigation water exposure are always present, potentially significant, and should be imminently addressed. In contrast, civic informants believed little to no health risk exists and attention to the issue is not necessary. This division in perspectives represents the absence of a community field (due to the lack of convergence of perspectives toward locality-based action for the common good) [13, 15]. These divided perspectives also represent what Irwin [12] terms 'situated knowledge' versus 'scientific knowledge'. In the case of the university and civic informant perspectives, the university informants possess scientific knowledge, or knowledge constructed or given meaning in a scientific setting, and the civic informants possess situated knowledge, or knowledge constructed or given meaning in a local setting. This highlights the way that pollution issues such as the one that is the focus of this paper are constructed and viewed differently in different settings. Irwin [12] suggested

"...(T)he extent to which pollution issues are viewed as matters of concern cannot simply be established in scientific or technical terms... Rather than seeing problems as simply given, we have viewed 'sense-making' as a process of active construction within particular contexts and settings."

Accordingly, the extent to which irrigation water pollution issues are viewed as matters of concern cannot simply be established in scientific terms. Researchers need to better understand how these issues are constructed in non-academic settings as well to attain a broader understanding of the complexity of the issue. Scientific knowledge may ignore or discredit the power of collective memory held within a local population that enhances a higher risk tolerance or aversion to thinking about risk [12].

Considering the scientific research perspective that there are threats to children's health and safety from irrigation water exposure, future research is warranted. In addition to physical water sampling and testing to identify risks, it is important to understand the differences in perceived risks (university versus civic perspectives) in order to establish a means of communication between the public and public leaders in an effective way. Irwin [12] discusses the need to carefully address disconnections between scientific and local perspectives:

“From one point of view, the accounts offered by local people...can be seen as reflecting an information shortage (or ‘deficit’). If only residents had access to more complete and authoritative information, then they would not need to bring together such partial information and clues – they could simply deal with the ‘real’ situation... Of course, this formulation also grants privileged status to the experts (whether scientific, industrial, governmental, or, indeed, sociological) who might be expected to understand best what the situation really is.”

As this quote suggests, without an established communication flow among the public, local leaders, and the scientific community, information presented to the public from “experts” could easily be dismissed and this wouldn’t be beneficial to any of the actors involved. Finding middle ground between polarized perceptions is essential to mitigating risks while being mindful of different vantage points among local stakeholders. Creating forums for multi-directional dialogue are key to community-based risk management.

Future inquiries into irrigation water-related risks should emphasize evidence-based inquiry into water quality, while also addressing the socioeconomic context of local exposure. Analyzing secondary data on sociodemographic characteristics of residents in areas with increased access to open irrigation waters (including irrigation ditches, canals, and gutters) is warranted. This assessment could provide insight into whether those of a lower socioeconomic status have more irrigation water exposure routes, allow for more specific consideration of how children from a lower socioeconomic status may experience more exposure pathways and greater levels of vulnerability, and aid in the development of targeted educational and outreach materials to address potential irrigation water-related risks. Furthermore, extending qualitative research into perspectives of local residents, particularly parents, would be informative.

ACKNOWLEDGMENTS

This research was conducted as part of the Break the Cycle of Health Disparities program and was also inspired by USDA funded research on health risks associated with water reuse for irrigation (Project #WF2294). The authors thank all participants and the Break the Cycle program for contributing to this project in numerous ways.

Chapter 65

ENVIRONMENTAL JUSTICE FOR VULNERABLE FLORIDA CHILDREN IN HURRICANE AFTERMATH

***Manmit Singh[†], BS, Dylan Avery[†], BS
and Valerie Mac*, PhD, FNP-C***

Nell Hodgson Woodruff School of Nursing,
Emory University, Atlanta, Georgia, USA

ABSTRACT

In this chapter we conduct a literature review to identify environmental and socioeconomic factors that affect vulnerability and resilience of communities in the event of a hurricane, particularly children in selected communities in South Florida. Qualitative data analyses mobilizing GIS visualization were used to display spatial patterns of hurricane hazards and demographic vulnerability factors across Floridian counties. Results showed that, while environmental vulnerability is a reality in the entire state of Florida, socioeconomic vulnerability varies widely throughout the state. Further, counties in Florida that are highly vulnerable according to the Social Vulnerability Index (SVI) are also the counties with the greatest proportional population of children under the age of 18 years old. While conducting analyses, several challenges in vulnerability assessment were identified, including but not limited to, the need for more refined indicators of environmental risk to better represent vulnerable populations.

INTRODUCTION

A projected 4 degree Celsius increase in global temperatures (see Figure 1) and an average global sea level rise of from 45 to 82 centimeters by year 2100, with increasing intensity and frequency of natural disasters, should be recognized as significant indicators that climate change is an emergent threat to global health [1]. While the impacts of climate change

* Corresponding Author's Email: valerie.mac@emory.edu.

[†] Denotes first co-authors.

have detrimental effects on both the environment and the population [2], children and the elderly are the most vulnerable. Children are dependent on the resources of their caregivers and communities and, therefore, are arguably some of the most climate-vulnerable members of society, including vulnerability to climate-related environmental exposures. Compounding the structural vulnerability of children, this population is also physiologically vulnerable, with increased absorption of toxicants due to increased consumption of water, air, and foods for their size, and immature metabolic systems compared to adults [3]. Environmental exposures may impact a child's lifelong health trajectory as a result of both the interruption of healthy living during childhood and longer periods to develop chronic diseases as a result of exposures, predisposing these children to poorer long term-health trajectories [1, 3]. The global burden of disease index identifies global climate change as a growing contributor to global disease burden, of which children making up 88% of the disease and disability impact attributed to climate change [4]. Socio-economic status compounds the risk and impact of environmental exposures to children, and climate change will increasingly be a contributing cause of disease and disability among this vulnerable population [5].

The vulnerability of children, related to their developmental status, lack of autonomy, and sociological displacement in the aftermath of an extreme weather event is often overlooked [5]. Previous studies have identified vulnerability and resilience as factors predictive of the severity of detrimental effects of adverse weather events such as hurricanes [6]. This vulnerability is further compounded by multiple risk factors associated with socioeconomic status of the child's family and community [5]. Examples include rate of illness, nutritional status, infrastructure quality, and community resources (see Figure 2a and Figure 2b). While many factors, both environment and social, have been identified, the complexity of the interaction with child health remains poorly understood. The current motivation for research is identifying these vulnerable populations, based on geographical and social risk factors, in order to allocate resources to promote resilience for these children.

Figure 2b. Florida SVI by state by category (Top: Household and transportation, Bottom: Minority status and language).

The implications of climate change and the associated environmental impacts have long been studied and proven to have detrimental effects on children's health [1, 4, 7, 8]. With this evidence, it is imperative that children are specifically considered when assessing the vulnerability and resilience of a community. The combination of environmental hazards, socioeconomic inequity and developmental vulnerability create an interconnected cycle of children's environmental health inequity represented in. Each element of the cycle of health disparities represents a key area where interventions have the potential to break this cycle in children.

In the recent hurricane season of 2017, Hurricane Irma on September 10, 2017 revealed the intersectional effects of poverty and inequity on populations in Florida. The extreme effects of the storm in communities such as Immokalee, Florida, primarily made up of immigrant families, was left with meager resources following the storm in obliterated housing units and many days without power, resulting in severe food insecurity and no source of income due to flooding of crops [9]. Vulnerable communities like Immokalee, and the children residing within them, exist throughout the state of Florida, and need identification with further representation and accounting to counteract their heightened vulnerability. These efforts will lead to the development of strategies to build resilience in the face of future effects of climate change.

The specific vulnerability faced by these children in the aftermath of a hurricane (from impacts of storms and sea level rise on infrastructure like roads, railways and drinking water) includes scarcity of basic natural resources [2] resulting in undernutrition, and displacement, which leads to risks to security, adverse physical and mental health consequences, and disruptions in education [1]. In 2016, Garcia and Sheehan conducted a literature review to examine the direct and indirect effects of extreme weather events (EWEs) on children's health. The review compared a traditional model of climate change-based health impacts with a nonlinear and more complex model that takes into account biopsychosocial interactions [10]. Common health impacts identified in the current literature included:

- direct impact health effects (i.e., trauma, injury, drowning, infections, asthma exacerbations, dust/toxin exposure, medication disruption, crowding and increased cumulative stress)
- indirect impact health effects, which occur due to ecosystem and social systems being negatively impacted (i.e., infectious disease outbreaks, waterborne illnesses, poor nutrition, disruption of vaccine schedules, displacement from their homes, and food contamination), all of which eventually lead to undernutrition
- direct and indirect mental health effects (i.e., post-traumatic stress disorder (PTSD), chronic "survival mode," or prenatal maternal stress that affects the fetus) [10–13].

It is evident that the health effects of hurricanes and other EWEs are vast and complex. However, several studies show that cultivating resilience is the key to dampening the health effects that children face [10, 12, 13].

As a result of the effects of Hurricane Irma on Floridian communities, this project explores social vulnerability metrics as they relate to pediatric populations and the cycle of environmental disparities. Susan Cutter et al. [14] developed a social vulnerability index (SoVI) by identifying perceived vulnerability based on 11 identified factors at the county

level of resolution [14]. This index was utilized to classify and rank counties by their measured vulnerability. The Center for Disease Control and Prevention's (CDC) social vulnerability index, that is calculated using demographic variables from the US Census American Community Survey which are then ranked by county, was identified during the literature review as a tool to explore environmental vulnerability and disparities that Floridian children face [15].

With all intricacies in mind, the following question was posed: "Are certain Floridian populations of children more vulnerable to the effects of hurricanes based on their geographical location and sociodemographic factors?" We utilized key principles of children's environmental justice to identify areas of potential impact within the Cycle of Environmental Health Disparities framework (Figure 3). This project aimed to identify areas where pediatric populations are most vulnerable and will most greatly benefit from interventions in the community, socioeconomic and environmental hazard domains of the Break the Cycle framework.

OUR REVIEW

Initially, existing literature relevant to the topic was assessed utilizing the keywords: 'hurricanes,' 'Florida,' 'resilience,' 'vulnerability,' and 'children.' Databases utilized in this search included PubMed and JSTOR in the initial search conducted December 12, 2017. Key search terms included 'disasters,' 'Florida,' 'children,' 'vulnerability,' and 'resilience.' Inclusion criteria consisted of an assessment of external validity, publication within the last 20 years, and geographic region. Articles older than 20 years or not relevant to the Florida climate were excluded. The review was performed to assess vulnerability and resiliency factors relevant to hurricane disasters. Measures of resiliency and vulnerability were reviewed in the search in order to develop a measure of social vulnerability. Measures of environmental risk were also reviewed in order to classify disaster records consistent with current studies.

In order to promote reproducibility at a level that can inform disaster preparedness best serving children in the future, we utilized the CDC Agency for Toxic Substances and Disease Registry's (ATSDR) Social Vulnerability Index (SVI) developed from the US Census American Community Survey as a preliminary index to inform the social factors in our study [15]. This index consists of 15 descriptive factors that are recorded from census data during the American Community Survey every five years. This index was chosen primarily due to the incorporation of several variables that represent children as this is the focus of our research. We also utilized this index for the sake of reproducibility and accessibility. These variables were recorded at a county level, which is the level at which emergency preparedness resources in Florida are disseminated.

The 15 factors considered by the CDC's Social Vulnerability Index (SVI) are broken up into four sections that collectively represent social vulnerability:

- "Socioeconomic status" which consists of the factors: percent of individuals below poverty, percent of civilians unemployed, per capita income, and percent of adults over age 18 years with no high school diploma

- “Household composition and disability” which consists of the factors: percent of persons 65 years of age or older, percent of persons 17 years of age or younger, percent of persons more than 5 years old with a disability, and percent of single male or female householder, no spouse present, with children under 18
- “Minority status and language” which consists of the factors: percent of minority and percent persons 5 years or older who speak English less than “well”
- “Housing and transportation” which consists of the factors: percent of multi-unit structure, percent of mobile homes, crowding (at household level, more people than rooms, percent total occupied housing units (i.e., households) with more than one person per room), percent of households with no vehicle available, and percent of persons in group quarters (i.e.,: correctional institutions, nursing homes, college dormitories, and military quarters).

Figure 3. Cycle of health disparities and hurricanes.

Each of these four categories were classified, ranked by quantile and visualized using choropleth mapping (see Figure 3). Quantile ranking for all raked variables are listed from lowest ranked vulnerability to highest ranked vulnerability. Total SVI was ranked by county and classified by percentile (higher SVI ranking being more vulnerable) for visualization using choropleth mapping by quantile (see Figure 4).

Figure 4. Choropleth visualization of SVI and percent of pediatric population (a. Top SVI, b. Bottom: Pediatric population).

Figure 5. Linear interpolation of hurricane discrete path winds (a. Top: Total hurricane history, b. Bottom: 20-year history).

The Rstudio® (Version 1.0136) platform for statistical computing and graphics was utilized to manage and process data provided by the US Census and National Oceanic and Atmospheric Administration (NOAA). RStudio® scripts and records managed in a Git repository were used to manage the project for collaboration and open access. Environmental System's Research Institute's (ESRI) ArcGIS® software was utilized to perform geographic information system (GIS) visualization and data analysis. The 15 components of the CDC's Census SVI were mapped utilizing RStudio® and GIS technology. Each component was mapped individually and another map compiling all 15 indices was created to reflect overall social vulnerability at the county level for all Florida Counties.

Historical hurricane data was utilized to classify future risk. All hurricane paths classified by wind speed from 1851 to 2016 were mapped to assess for any patterns predictive of future hurricane paths. Hurricane path centroids (a point vector) were calculated for each line vector data point. Linear interpolation was then performed to qualitatively visualize regional historical hurricane wind trends utilizing raster format, a dot matrix data structure. Hurricane wind data from the Florida State Hazard Mitigation Plan was mapped for both the total recorded history and the last 20 years to observe differences in recent history (see Figure 5). In order to further analyze environmental risk, a storm surge hazard map was created reflecting storm surge by storm category (1 through 5) from NOAA data.

Figure 6. State of Florida: State Hazard Mitigation Plan, 100 Year probabilistic scenario [17].

FINDINGS

Spatial interpolation of hurricane wind speed using NOAA data of recorded hurricanes from 1851 to 2016 (see Figure 5a) shows a dispersed distribution of wind speed compared to an interpolation using a 20 year timeframe between 1996 and 2016 (see Figure 5b). This visualization of the 20 year interpolation represents a utilization of a time frame consistent

with current literature [14, 16]. Despite this, the results of whole history (1851 to 2016) interpolation more consistently resembles the Florida State Hazard Mitigation Plan assessment of hurricane disaster geographic probability (see Figure 6) [17].

Classification of census demographic information by county in Florida based on the CDC's SVI provides evidence of disparities between counties. Choropleth maps denoting areas of statistical variability utilizing shading in proportion to measurements of the SVI ordered, ranked and classified the data into quintiles, highlighting distinct differences in SVI between counties. SVI ranking by subcategory is depicted as well. The resulting map (see Figure 4a) shows the central southern counties in general making up a larger proportion of the high SVI areas than the coastal counties (with some exceptions, namely Miami-Dade County). Choropleth visualization of the county proportional population of people under the age of 18 (see Figure 4b) reveals a pattern similar to SVI ranking.

DISCUSSION

Results from the review of historical hurricane track data for the past 20 years (depicted in Figure 5) reveals that hurricane wind hazard risk is broadly dispersed across the state, with wind speed intensity increasing in Floridian counties of lower latitude. This suggests that hurricane force wind risk as a variable in vulnerability remains relatively constant between contiguous counties. These risk models are based on historical assessment data, which for the most part do not account for trends in storm intensity. Recent research suggests that global climate change trends will be associated with an increase in the intensity and impact of hurricane force winds in the Gulf Coast region [2]. Therefore, with the majority of the global burden of disease affecting children being attributed to climate change, the inclusion of effects of climate change on hurricane risk in future assessments is extremely important [1, 4]. Because we were unable to perform any correction based on spatial or temporal autocorrelation, our ability to draw conclusions was limited to preliminary qualitative assessment. Despite this, our results were consistent with the state of Florida's hazard mitigation plan.

GIS visualization of CDC's SVI from data provided by the U.S. census reveals several potential patterns in vulnerability across the state of Florida. By reviewing the raw population count by county and total pediatric population (<18 years old) by county (see Figure 2), it is evident that a larger proportion of the total Floridan population resides within coastal counties. Further, visualization of the county SVI ranked quintiles (see Figure 4a) reveals that, while the inland counties make up a smaller proportion of population, they inversely make up a larger proportion of social vulnerability compared to other counties in the state. Further, inland Floridian counties make up a larger proportion of counties with a higher proportion of children (<18 years old) when compared to counties statewide (see Figure 4b), with a few exceptions in the larger metropolitan centers. This suggests that a future direction should be to explore this pattern in greater detail to confirm and explain any disparity in environmental vulnerability impacting children.

Hurricane storm surge hazard data from the NOAA was classified into quintile and visualized on a choropleth display (see Figure 7)). The map depicts the storm surge depth (in feet) based on the presentation of a category 5 storm. The figure depicts that the coastal

counties face the largest impact from storm surges, including several coastal counties that ranked in the highest SVI quantiles (i.e., Miami-Dade County). With increasing sea level rise [2], storm surge risk will continue to encroach on more inland areas including counties in the southern central region of Florida that represent a larger proportion of the state's social vulnerability (see Figure 4). One major limitation in our storm surge assessment was the lack of resources to analyze trends in flooding risk, which could demonstrate the effects of higher sea levels and other climate change on the coastal regions of Florida.

Figure 7. NOAA storm surge risk disaster visualization.

An important impact to note regarding environmental disasters in the Gulf Region is that Hurricane Irma also displaced Puerto Ricans and other Caribbean country residents, many of whom sought refuge in Florida counties. Such countries are extremely vulnerable in that they have large poor populations that are may become climate refugees due to likely increases in EWEs in this region. The effects of EWEs on poor populations can be seen in the aftermath of Hurricane Maria in Puerto Rico for instance. Due to their high vulnerability low resilience state, they are still without power in many regions. Therefore, these populations must be considered in future emergency preparedness efforts in Florida, as these refugees are vulnerable to further secondary displacement in the eye of future storms if unaccounted for. Assessing the risk and needs of pediatric populations within refugee and local undocumented populations living in Florida counties is beyond the scope of this manuscript, but should certainly be considered in future efforts to create equitable change in Florida.

Figure 8. Florida population count choropleth by county (a. Top: Total population count, b. Bottom: Total pediatric population count).

Future directions will include a more intensive look at the demographic patterns suggested in our demographic analysis of Census data. Inland regions appear to make up a larger proportion of the State's vulnerable communities and proportional population of children, as ranked by the ATSDR's SVI. Detailed analysis needs to be performed on the risk factors for pediatric vulnerability and health outcomes related to environmental disasters in Florida counties. Specifically, a focus on risk factors relevant to the vulnerability of pediatric populations needs to be explored (see figure 8). Additionally, future efforts need to be made to incorporate migrant and refugee populations in Florida to better represent the whole population (including children) and gauge overall need across counties in Florida. Another future focus will be incorporating probabilistic modeling of climate change into our risk assessment, to provide a better picture of future risk in vulnerable communities, specifically considering the vulnerability of pediatric populations. This ideally will include a more comprehensive integration of hurricane hazard assessment with factors such as infrastructure quality, community resiliency indicators, and demographic risk factors that are sensitive to child health. We hope to accomplish these future aims through partnership with local organizations including researchers and advocates at the University of Florida, the Farmworker Association of Florida, and the Nell Hodgson Woodruff School of Nursing to gather original data for further analysis.

ACKNOWLEDGMENTS

We would like to offer special thanks for the Breaking the Cycle Program as well as Pediatric Environmental Health Specialty Unit (PEHSU) for their guidance throughout our research.

Chapter 66

SOCIAL MEDIA AS A TOOL FOR BREAKING THE CYCLE OF CHILDREN'S ENVIRONMENTAL HEALTH DISPARITIES

***Talia Bernhard^{1,*}, BA, Faith Bygrave^{1,2,†}
and Nsedu Obot Witherspoon³, MPH***

¹College of Arts and Sciences, Emory University, Atlanta, GA, USA

²Nell Hodgson School of Nursing, Emory University, Atlanta, GA, USA

³Children's Environmental Health Network, Washington, District of Columbia, USA

ABSTRACT

Social media plays a role in many current public health practices, although the details of online activity among children's environmental health professionals is unknown, which inspired this project. Twenty-five children's environmental health (CEH) professionals completed an online survey about their organizations' use of social media in promoting CEH and in addressing CEH disparities. The survey examined social media habits, measures of success, challenges, and communication strategies. Based on qualitative feedback, most indicated that social media supports the goal of their organization. Results indicated a range in online activity levels and several difficulties in using social media in professional settings. This project also probed whether or not CEH professionals focus their online efforts on vulnerable populations (minorities, low SES or those with limited education). A majority of respondents declared they do not focus their online efforts toward any particular population group. This findings of this project illustrate a need for further efforts on how to effectively utilize social media for public health communication to improve CEH and reduce CEH disparities.

Figure 1. Factors that contribute to children's environmental health disparities (this project pertains to Compound Risk Factors and Personal Characteristics).

INTRODUCTION

Social media networking platforms such as Facebook, Instagram and Twitter give individuals the ability to “make connections by sharing expressive and communicative content,” [1]. Facebook and Twitter link organizations and diverse populations to share information through virtual communication [2]. Instagram allows individuals to share and search for photographs and videos online [2]. These platforms play an important role in everyday communication and connections between individuals and organizations. The use of such platforms as a resource for mass communication makes them very useful in the creation and dissemination of on-line sites that can reach and influence human behavioral interactions. The reach of such platforms makes them important for health communications and for public health research on health communications. About 44 million individuals use Facebook to communicate and browse online for posts about science and health-related areas [3]. However, use is not evenly distributed: there is an imbalance in the time spent on social media among different age ranges [4]; and Hispanics and African American are proportionally higher user groups than Caucasians of platforms such as Facebook, Instagram, and Twitter [5]. While these platforms could serve to promote children's environmental health (CEH) and to reduce CEH disparities, we need to explore ways to best use social media to reach those who are disproportionately affected by environmental health disparities due to risk factors such as limited educational services, limited social capital and limited health literacy. The cycle of environmental health disparities has many factors that could

adversely affect a children's health (see Figure 1). As children are more vulnerable and likely to be adversely affected by environmental toxins and stresses, it is important to emphasize the roles of two elements relating to disparities in this cycle which are the 'compound risk factors' and 'personal characteristics' (see Figure 1). This project addresses to these areas by attempting to understand how different organizations that focus on CEH, target audiences that are disproportionately affected by environmental health disparities.

To date, there has been very little research regarding CEH communication through social media, likely because the use of social media is relatively new in healthcare research and communication [6]. While social media may be considered an unconventional tool for health communication by some, there are many potential benefits to its use for health communication, such as more shared information between the healthcare professionals and the general public, more peer support, a role in advocacy, and the potential to influence government policy [7]. According to the Children's Environmental Health Network (CEHN), a national nonprofit working to protect children from environmental hazards, 73.5% of the 82 respondents to their 2017 Eco-Healthy Child Care Survey expressed interest in education to promote awareness about environmental hazards that significantly affect children [8]. Paired with the sparse literature about best practices for social media messaging and CEH, this interest in education provides a stimulus for new research into how social media can help advance CEH. This project analyses a survey of a set of CEH stakeholders to assess their use of social media with regard to promoting children's environmental health literacy.

OUR STUDY

Survey participants were individuals involved in CEH consisting of primary care physicians, leaders of children's environmental health centers in the US, environmental community group leaders, and child care professionals. This group was chosen to provide a diversified perspective on the current use of social media in local communities and public health centers. Participants were drawn from lists of individuals connected to the Pediatric Environmental Health Specialty Unit (PEHSU) network and Children's Environmental Health Centers (CEHC). The PEHSU's are regional centers throughout the USA as national network of healthcare providers and academics with a mandate to provide knowledge and awareness about children's environmental health hazards to health care professionals and the public and offer effective and practical ways to combat these hazards [9]. The CEHC's are a nationwide set of academic based programs that conduct research focused on improving children's environmental health [10]. Both organizations make extensive contributions to knowledge and awareness of children's environmental health for a diverse set of communities.

A survey containing a mixture of open-ended and multiple-choice questions was developed (see Figure 2) exploring familiarity and functional use of social media in the work of these organizations. The survey was placed on Google Forms, a convenient and accessible survey platform. Respondents were given the option of completing the survey online or participating in a phone interview. The first and second sections of the survey sought basic details of the responding organization, and in the use of social media platforms. The third section used multiple-choice questions to inquire about target populations, and to record the

Break the Cycle Project Survey (Adults: Adults & Children's Environmental Health)

Please print your name, title, organization, address, phone number, fax number, email address, website URL, and other contact information at the bottom of this page. Please print clearly. If you are unable to print, please email us at info@breakthecycle.org.

Your email address: _____

Part I

What is the name of your institution, agency, organization, etc? _____
 - Most relevant link: _____

Where are you based? (City, State) _____
 - Most relevant link: _____

What social media platforms does your group use to publicly communicate about children's environmental health issues and/or issues? (Mark all that apply.)

- Facebook
- Instagram
- Twitter
- YouTube
- Email Group
- Podcast(s)
- Print material (booklets, brochures, etc.)
- Blog website

Part II

Does your group attempt to reach particular ethnic groups or racial/ethnic groups? If yes, which of the following groups do you attempt to reach? (Mark all that apply, or select the two options if your answer is both.)

- We do NOT target any group in particular
- Asian
- Black/African American
- Hispanic or Latino

How active is your group on social media?
 Once a month or less
 A few times a month
 Once a week
 Once a day
 Multiple times every day

Does your group measure social media outreach success?
 Number of tweets/followers:
 Number of likes/views
 Number of retweets/reposts
 Number of participants at in-person events

Does your group use any particular social media strategies?
 No, we do not use any particular strategies
 Live! Twitter chat
 Facebook to Instagram Live! video format
 Links to videos
 Social media challenges

Can describe some challenges your group has faced in successful social media outreach.
 Limited content to share
 Limited financial resources
 Limited staff capacity/time
 Difficult to engage with audience
 Difficult to increase followers/viewers
 Difficult to understand how to use different platforms
 Technological difficulty

Native Americans and Alaska Natives
 Native Hawaiian or Other Pacific Islander
 White/Caucasian
 Other

Does your group attempt to reach people of any particular socioeconomic status (SES)? If yes, which of the following groups do you attempt to reach? (Mark all that apply, or select the one option if your answer is no.)

- We do NOT target any group in particular
- Household income < \$10,000/year
- Household income between \$10,000/year and \$20,000/year
- Household income between \$20,000/year and \$30,000/year
- Household income > \$30,000/year

Does your group attempt to reach people of a particular education level? If yes, which of the following groups do you attempt to reach? (Mark all that apply, or select the one option if your answer is no.)

- We do NOT target any group in particular
- High school or less
- Some college
- College
- Graduate training

Which of the following groups are included in your organization's membership or target population? (Mark all that apply.)

- At-risk/At-Disadvantaged (wealth protection)
- Educators (schools)
- General public
- Government (local, state, federal)
- Healthcare providers (physicians, nurses, etc.)
- Non-profit organizations
- Parents
- Researchers

Part IV

How do you see your group's work as breaking the cycle of childhood environmental health disparities? (e.g., My organization incorporates environmental justice into our mission and work). Please be as detailed as possible.

- Long answer text

Part V

Does social media help your group accomplish its goals?

- Yes
- No

Please describe why you answered yes or no to the previous question.

- Long answer text

Does your group offer non-social media based measures or materials to reach vulnerable/high risk populations?

- Yes
- No

Please describe why you answered yes or no to the previous question.

- Long answer text

Part VI

Would you or someone from your organization be willing to participate in a 15-minute interview (by phone or in person)?

- Yes
- No

If you answered yes, please provide your email and a phone number which we can contact you.

Figure 2. Components of the survey given to healthcare providers and community partners.

FINDINGS

Of the 30 individuals contacted, 25 responses were received between February 20th, 2018 and March 14th, 2018 (response rate = 83%). Of these, ten were from Atlanta, Georgia, five were from Washington, DC, three from Illinois, two from California and one each from Alabama, Mississippi, New York, North Carolina and Tennessee (see Figure 3).

The first part asked about the use of social media and, as displayed in Figure 4, the most commonly used social media platform was Facebook (21/25; 84%). A total of 19 out of 25 respondents reported using a blog or website; 15 reported using Twitter, nine reported using Hootsuite (a social media platform which allows users to disseminate and track content on multiple social media channels simultaneously); and nine reported using Instagram. Twenty-two organizations reported using print sources, such as flyers and brochures, to inform their audiences.

Figure 3. Geographic representation of survey respondents.

Figure 4. Most used social media sites by survey respondents.

Part II of the survey asked respondents which demographic groups they target through social media (respondents could select more than one group on the survey). Fourteen of the 25 reported not targeting any particular group. Ten reported that their organizations attempt to reach a Black/African American audience, five targeted the Hispanic/Latino audience, four reported targeting Asian populations, and three organizations (or fewer) each marked Native American/Alaska Native, Native Hawaiian or Other Pacific Islander, and White/Caucasian. The survey also questioned respondents about whether they target particular socioeconomic (SES) groups; 18 out of 25 reported not targeting any specific SES. Four respondents reported trying to reach people with an annual household income of \$20,000 or less. Respondents were also asked to identify the targeted education levels they sought to reach (identifying as many as applied); 16 of 25 reported not trying to reach any particular education level in their audience. Eight reported targeting those with a high school education or less with some college or college education; one organization focused particularly on those with some college or college education. A majority of respondents marked the following in their organization's stakeholder or target population: advocates, educators (health promotion and school), general public, government (local, state, federal), non-profit organizations, parents, and researchers.

Part III of the survey focused on gauging how the organizations use social media. To the question 'How active is your group on social media?', six organizations reported using social media once a day and six others reported social media activity a few times a month. Others ranged broadly from never using social media to using it multiple times a day. To the question 'How does your group measure social media outreach success?' 18 out of 25 indicated they refer to the number of 'likes,' reactions to an online post, and/or views; 16 used the number of new online followers as a marker; and 11 considered the number of re-posts or re-tweets, as indicative of an increase of online recognition. Ten respondents considered the number of people at in-person events, as opposed to online activity, as a marker of success. Six reported not measuring success; some even acknowledged that they are unsure how to do so. To the question 'Does your group use any particular social media strategies?' 16 of the 25 individuals reported not utilizing any strategies. Of those who do use specific strategies, six reported posting links to videos and others include 'live' features, such as Twitter chats, and Facebook or Instagram videos which are real-time 'conversations,' either posts on Twitter in a question and answer format, or 'Live' video on Facebook or Instagram which allows people to live-stream themselves and answer questions that are sent by viewers, contests and giveaways, e.g., "Share photos of your local parks and greenspaces using the hashtag #gogreenATL to be entered in our iPad raffle," and referring to popular hashtags.

The last question in Part III of the survey asked about challenges respondents face in using social media. Eighteen reported limited staff capacity and time, ten cited limited financial resources, and seven reported difficulty with increasing followers and viewers. Other challenges that respondents faced, though less frequently reported, included difficulty engaging with the audience, limited content to share, difficulty understanding how to use different platforms, and public affairs oversight.

Part IV of the survey allowed individuals to share how they see their group's work addressing the issue of CEH disparities. Many work for organizations that strive to address underserved communities through social media, in addition to in-person events. Some referred to social media as a medium for direct participation and citizen science, while others use media-based learning modules for environmental justice content.

Figure 5. Survey results of social media use and effectiveness. (A) Responses to the question, "does your group offer non-social media-based resources or materials to reach vulnerable/high risk populations?" (B) Responses to the question, "does social media help your group accomplish its goals?"

Part V sought to ascertain how respondents see social media in helping their organizations accomplish their goals and queried whether respondents offer non-social media-based resources to reach vulnerable populations. Eighty-four percent, 21 individuals, responded 'Yes, social media helps my group accomplish our goals', as indicated in Figure 5. Respondents were then asked to describe why they answered yes or no. According to those who responded positively, meeting their goals was accomplished by spreading awareness, engaging people, contributing to advocacy work, tightening their message and broadening their reach. For the four respondents who did not view social media as helpful in accomplishing their organization's goals, they pointed to a lack of community engagement with their organization's online media.

To reach vulnerable or high-risk populations who may lack access to electronic media, 88% reported offering non-social media-based resources, as shown in Figure 5. Those include print materials, meetings and workshops, and training, which provide additional educational access and support, according to their free response answers. This finding may have implications for the efficacy of social media in reaching vulnerable populations, creating a need to probe more effective engagement strategies.

DISCUSSION

Education, advocacy, and engagement all can be promoted through social media, and these activities are congruent with the goals of CEH organizations. The purpose of this survey was to gauge how CEH organizations use social media, to ascertain the benefits and challenges they experience in their social media activities, and to determine whether they focus on reaching vulnerable populations. A total of 25 individuals, from different organizations in the United States who work in various capacities addressing CEH, completed our survey.

Given that respondents generally reported positively that social media helps their organizations accomplish their goals, social media activity clearly serves a valuable purpose as a form of public health communication. However, six out of 25 (almost one quarter of the respondents) reported not measuring social media outreach success. The discrepancy between a large proportion pointing to the benefits of social media and the individuals who declared they do not evaluate social media outreach success is concerning. Without measuring the effects of social media activity, some may overstate or underestimate the true benefits, and opportunities for improving social media use may be missed.

Facebook, Twitter, Instagram, Hootsuite, blogs and websites were used by most of the respondents. The reported levels of activity varied greatly, ranging from posting once a month to multiple times a day. While the results of this survey suggest there is a high rate of social media use among organizations that work toward improving CEH, there are other groups working in public health who have not yet engaged with online social media. In 2012, a study found that only 60% of state public health departments reported using at least one social media account, suggesting, “social media use by public health agencies is in the early adoption stage” [11]. In the six years since those findings, the number of public health organizations participating in social media outreach for public health communication has likely increased as social media platforms have expanded and become more popular and more accessible. Given the growing popularity of social media among all age groups, races, and genders [12], it will be important for organizations with a public health mission to consider the use of social media for outreach along with other traditional approaches.

Over half of the survey respondents confirmed their organizations do not have a formal social media strategy. Further research may elucidate the varying levels of efficacy in different social media strategies. For example, comparing knowledge and attitude changes between two different social media campaigns might offer evidence to better guide CEH professionals’ work on social media. Additionally, considering the high percentage of respondents (88%) who indicated they offer non-social media-based resources to reach vulnerable or high-risk populations, another potential point of improvement lies in making education through online and social media more accessible for all. For example, more concise and plain-language content can be helpful for reaching less educated individuals.

Despite the high number of respondents offering non-social media-based resources for vulnerable populations, most respondents did not target any particular education level, SES, or ethnic group on social media. For those who did report targeting specific groups, the pattern tended toward focusing on typically more disadvantaged communities. As a result of not focusing on vulnerable communities, organizations may not effectively reach such populations. By developing a comprehensive social media strategy that includes culturally

relevant, plain-language content, dedicating appropriate staff and resources, and using analytics to evaluate the effectiveness of the outreach, organizations can better position themselves to address vulnerable populations and break the cycle of CEH disparities.

Eighty-nine percent of American adults use the internet [13], and the figure is only increasing. Now more than ever individuals are and will continue to be empowered to learn, challenge, and act, given almost nine-in-ten have constant access to information and can express themselves at the push of a button. ‘Science for the People’ was a slogan adopted by activists in the 1970s. ‘Science by the people’ is a more inclusive aim and is becoming a distinctly 21st century phenomenon” [14]. The benefits of widespread access to social media and the internet enables collaborations between citizens and researchers along a continuum of public engagement in scientific research. For example, a scientist or research team may have a specific focus of interest and engage the community to help develop research questions, design a study, and collect data. In contrast, citizen science efforts are driven by community concerns, where community-initiated projects may involve a partnership with an academic or research institution, and both parties work together to collect and share data. The goal is to address a community concern through collaborative research, and to translate the research findings into public health action that benefits the community [15].

It is expected that the use of social media in health communication and in research will evolve and, in the process, serve to improve the health and wellbeing of the general population and for the purpose of this project, advocacy to improve CEH and help to reduce CEH disparities.

ABSTRACT

The Wakefield study on measles-mumps-rubella (MMR) vaccine and autism with the subsequent spread of misinformation by various media outlets have resulted in an increase in vaccine refusal by parents and a reemergence of vaccine-preventable diseases, which we see now with the spread of measles, which has resulted already in several deaths. The rise of echo chambers on social media has made it difficult to reach members of the anti-vaccine movement to change their beliefs about vaccines, even when presented with quality scientific evidence. If the trend does not reverse on its own, the situation may escalate to a point where immunizations must be made legally required to protect herd immunity. Simultaneously, we must work to educate upcoming generations about the Wakefield study, its fallout, and the dangers of vaccine refusal so that they will be better equipped to protect themselves and their children from the ramifications of misinformation.

INTRODUCTION

As St George's University, Master of Public Health (MPH) program celebrates its 20th anniversary in 2019, there have been significant gains and challenges to the public's health. The old adage, At the end of this second decade of the 21st century, one of the main tools of public health, vaccination, is having an anti-vaccination experience. Lost memory of diseases prevented by vaccines and misinformation has led to an increase in vaccine refusal. This has resulted in the return of many cases of preventable communicable disease, including measles. This editorial will explore how the anti-vaccine movement came about and what needs to be done to address this issue to prevent it from recurring in the future.

IMMUNIZATION

Immunization is the world's most cost-effective preventative health intervention. Immunization prevents 2-3 million deaths per year and vastly reduces the burden of disease around the globe. Therefore, enhancing access to immunization is a top priority for every nation and is, "crucial to achieving the (World Health Organization's) Sustainable Development Goals [1]." There are many examples of the successes of vaccination: accelerated immunization programs decreased the worldwide mortality rate of measles by 84% from 2000 to 2016; meningitis A epidemics have been nearly eliminated in Africa after introducing the vaccine to the region in 2010 and "the world is closer than ever to eradicating polio" [1].

However, in 1998, Dr Andrew Wakefield published a paper in *The Lancet* that suggested a link between the measles-mumps-rubella (MMR) vaccine and autism. His study prompted the scientific community to spend millions of additional research dollars trying to validate his findings. In the meantime, news of a potential link between autism and vaccines spread around the world. Dr Wakefield's paper was used as ammunition in lawsuits against vaccine manufacturers and he was allegedly paid a sum of \$674,000 by lawyers who profited from these cases [2]. As a result, parents increasingly turned down vaccinations for their children and outbreaks of these vaccine-preventable diseases began to surface in numbers not seen since the vaccines were introduced decades beforehand.

Dozens of additional studies have been conducted in the years since the initial report and not a single study has found a link between autism and vaccinations, thoroughly debunking Dr Wakefield's original claims. This includes a 2012 study that was, "a review of 27 cohort studies, 17 case control studies, six self-controlled case series studies, five time series trials, two ecological studies, and one case cross-over trial covering over 14,700,000 children [3]." In 2004, 10 of the 12 original authors of that paper issued their own retraction, stating that, "We wish to make it clear that in this paper no causal link was established between MMR vaccine and autism as the data were insufficient [4]." Richard Horton, *The Lancet's* editor, "said he should not have published the study and that Wakefield's links to litigation against the manufacturers of the MMR vaccine were a 'fatal conflict of interest [4]." Despite this, *The Lancet* took until 2010 to officially retract the original paper, after 12 years of misinformation spread around the world. The chief of infectious diseases at the Children's Hospital of Philadelphia, Dr. Paul Offit, gave an opinion shared by many in the medical

community that, “This retraction by the Lancet came far too late. It's very easy to scare people; it's very hard to unscare them [4].” In other words, the damage was done and we are currently faced with a generation of parents who refuse to vaccinate their children, because of a fabricated link printed over 20 years ago.

VACCINES CAUSE AUTISM: ORIGIN AND PROPAGATION OF THE MYTH

Dr. Wakefield and his falsified report have already been introduced, but the spread of the myth he created required more than just a single paper. There is no doubt that his study, which proposed a link between autism and the MMR vaccine based on a case report of 12 children was dubious science. As it was a case report, every child in the study had autism and since the MMR vaccine was widely available in Great Britain at the time, it is likely that most of them had received the vaccine. Not only does the size of the study call its significance into question, but it is typically accepted that only a randomized clinical trial can truly establish causation.

So, what happened then? How did this study become so widespread and erroneously accepted as fact? For one, his study happened to be published around the time when the internet was beginning to take shape. Millions of people were starting to explore it for the first time and media outlets were still trying to figure out how to make the best use of it. Additionally, “Wakefield has been given ample opportunity either to replicate the paper's findings or to say he was mistaken. He has declined to do either.” Other studies were done using the Wakefield paper as a reference. One of these was the Rimland/McGinnis paper, which was published in the journal, *Lab Medicine*, in 2002. “The Rimland/McGinnis paper, citing more than 100 other papers, including Wakefield's 1998 paper, established connections between “patterns” of autism and immune response, as well as the timing of the vaccines.” This paper was not retracted by *Lab Medicine* until 2018! All these factors came together at the perfect time to make this story one of the first to go ‘viral’.

“Wakefield was at the center of a media storm about the MMR vaccine, and is now being blamed by journalists as if he were the only one at fault. In reality, the media are equally guilty. The media repeatedly reported the concerns of this one man, generally without giving methodological details of the research, either because they found it too complicated, inexplicably, or because to do so would have undermined their story.” Many of the journalists reporting on the story were not trained in the concepts of ‘association versus causation’ and their reporting reflected their lack of knowledge on the difference between the two. Mark Zweig, a medical doctor who also teaches reporters how to cover medical research, believes that, “an important part of reporting results of research in health news lies in attention to language that may in subtle ways imply cause-and-effect relationships, where the underlying study design does not warrant such language. We urge health care journalists to be mindful of when causal language is warranted by the study design and when it is not [9].” In other words, the media's lack of skill in interpreting medical research caused them to write stories that were factually incorrect. The rise of the internet and social media allowed these stories to spread like wildfire.

THE ROLE OF CELEBRITIES AND SOCIAL MEDIA

The internet and social media have created an environment where everyone is connected, all the time. It is possible for someone to use Twitter to engage in a conversation with their favorite celebrity or to share a story on Facebook and have it go instantly to their friends... and their friends' friends... and so on. This has brought us to an era of communication and information sharing that is unprecedented in all of human history. Unfortunately, much of this information is shared without fact-checking and misinformation runs rampant. It can also lead to the proliferation of certain biases simply because some people are more vocal on social media than others. The proponents of the anti-vaccine movement tend to be more active on social media regarding this issue than people who are pro-vaccine, for example, including celebrities.

Perhaps the most well-known celebrity member of the anti-vaccine movement is Jenny McCarthy. After her son, Evan, was diagnosed with autism she made numerous well-publicized statements on social media, the Oprah Winfrey show, and in Time Magazine that are not based on actual scientific data and have been very damaging to the medical community's efforts to maximize vaccinations. Here is a selection of some of her comments:

To Time Magazine: "I do believe sadly it's going to take some diseases coming back to realize that we need to change and develop vaccines that are safe. If the vaccine companies are not listening to us, it's their fault that the diseases are coming back. If you give us a safe vaccine, we'll use it. It shouldn't be polio versus autism."

To Oprah: "The University of Google is where I got my degree from... And I put in autism and something came up that changed my life, that led me on this road to recovery, which said autism—it was in the corner of the screen—is reversible and treatable."

On Social Media: "People are also dying from vaccinations. Evan, my son, died in front of me for two minutes. You ask any mother in the autism community if we'll take the flu, the measles, over autism any day of the week. I think they need to wake up and stop hurting our kids. Without a doubt in my mind, I believe that vaccinations triggered Evan's autism."

The power of celebrities lies in the fact that their fans take actions based on opinions that are shaped, in part, by their commentary. Jenny McCarthy's comments have influenced many people who share her beliefs to refuse vaccinations for their children. These people then go onto their social media channels to further propagate their beliefs.

THE MYTH'S EFFECT ON VACCINE-PREVENTABLE DISEASES

The Wakefield paper, outspoken celebrities, social media have all resulted in the anti-vaccine movement, which has culminated in a resurgence of vaccine-preventable diseases. Measles, mumps, rubella, pertussis, and polio have all been declared either eliminated from the Americas or vastly reduced since the introduction of their respective vaccines. However, all of them have had numerous outbreaks in the western hemisphere in recent years due to a combination of migrating travelers who carry the disease and waning herd immunity due to lower vaccination rates.

CONCLUSION

The Wakefield study and the subsequent spread of its misinformation by various media outlets have resulted in an increase in vaccine refusal and a reemergence of vaccine-preventable diseases. The rise of echo chambers on social media has made it difficult to reach members of the anti-vaccine movement to change their beliefs about vaccines, even when presented with quality scientific evidence. If the trend does not reverse on its own, the situation may escalate to a point where immunizations must be made legally required to protect herd immunity. Simultaneously, we must work to educate upcoming generations about the Wakefield study, its fallout, and the dangers of vaccine refusal so that they will be better equipped to protect themselves and their children from the ramifications of misinformation.

Chapter 68

DEPRESSION IN THE SKIES: AN OCCUPATIONAL HEALTH ISSUE AMONG PILOTS

***Satesh Bidaisee*, EdD, Abishek Bala, MD
and Sadik Uddin, MPH***

Department of Public Health and Preventive Medicine,
St George's University School of Medicine, St George's, Grenada

ABSTRACT

Depression is a global concern that affects individuals from every walk of life. It has been shown to have potentially significant impacts on a person's judgement, cognition, and motor function. This is of particular concern if an individual requires a high degree of mental and physical function in order to effectively perform their job and minimize risk to others. In the airline industry, pilots are responsible for multimillion-dollar aircrafts and the transportation of millions of passengers every year. However, recent events such as the crash of Germanwings flight 9525 have reinforced the notion of a proactive mental health screening among pilots. The studies reviewed here demonstrated that, although there are FAA protocols in effect for subjective interpretation of mental health status in airline pilots during a routine medical clearance, an underreporting of depression or depressive symptoms were present. This, in combination with associated risk factors such as stress and fatigue from extended hours and early shift work, household disputes, significant life stressors, and family history of depression create an environment that compromises flight safety. There is a need, therefore, to further investigate the causes of the underreporting of depressive symptom to encourage pilots to seek early and appropriate treatment.

INTRODUCTION

Depression is a serious medical condition that affects a person's mood, cognition, and physical functioning [1, 2]. Globally, the World Health Organization has estimated that in 2017 over 300 million people globally are suffering from depression, affecting all walks of life, and is on the rise [3]. The severity of this condition, it fact could have significant impacts on lifestyle and job performance [4]. This becomes particularly concerning if those suffering have significant responsibility for human life and safety as part of their job responsibilities. Within the airline industry, pilots are responsible for the lives of hundreds of passengers per day while controlling multimillion-dollar equipment. According to the International Air Transport Association (IATA), airlines carried 4.1 billion passengers in 2017, an increase of 7.3% over 2016 [5]. There have been several recent events that have highlighted the severe impact of mental health issues in pilots including the crash of Germanwings Flight 9525 on March 24, 2015 [4, 6, 7]. More frequently, effects of depression among airline pilots contribute to less catastrophic events but still have the potential to lead to compromises in safety if left unchecked [4, 8].

Currently, there are protocols for regular medical examinations in order to screen pilots for mental health issues. This involves a short series of questions and observational data by the medical examiner [8, 9]. However, some articles suggest that current protocols may not be sufficient to adequately identify and manage depression currently present in airline pilots [8]. This paper aims to review the current literature for the risk factors for depression in airline pilots.

METHODS

The Federal Aviation Administration (FAA) provides very specific guidelines for aviation medical examiners to use when clearing pilots for flight. These guidelines involve regulations, medical history, medical examinations and disposition [9]. To receive a certification, a candidate must not have any established history of severe personality disorders that cause an individual to display impulsivity or poor judgement, psychosis, bipolar, substance dependence (or demonstrating abstinence during the preceding two years), substance abuse within the previous two years, and any other medical or psychiatric condition that would inhibit the pilot from safely performing their duties at the judgement of the medical examiner [9]. The medical examiner is not required to conduct a formal psychiatric interview, but must instead 'formulate their evaluation based on medical history, demeanor, and information gathered from a genuine curiosity into the patient's life [9]. While it is critical for pilots to be truthful with their examiner, both for maintaining the integrity of the individual as well as receiving necessary treatments, these conditions could jeopardize their chances for obtaining their medical clearance and maintaining their career. Therefore, underreporting of mental health conditions is likely given these negative consequences [7].

DEPRESSION PREVALENCE AMONG PILOTS

According to the American Psychiatric Association (APA), there are very specific criteria required to diagnose major depressive disorder. These include depressed mood, anhedonia, disturbances in sleep and eating behaviors, psychomotor retardation, lack of energy, poor concentration, and suicidal ideations [10]. A survey in 2016 noted that the rate of mental health issues among airline pilots are similar to that of the US population [7, 8]. In his cross sectional survey, Wu et al. [7] received completed Patient Health Questionnaire (PHQ-9) information and determined that 12.6% of pilots studied met the depression threshold, and 4.1% of pilots reported suicidal thoughts. The FAA has stated as of December 31, 2018, there are 99,880 commercial pilots in the US, this number equates to 4,095 commercial pilots with suicidal thoughts [11].

RISK FACTORS ASSOCIATED WITH DEPRESSION

Although there are no specific causes that can be attributed to depression, there are several risk factors that must be taken into consideration. Generally, medical examiners are guided to determine certain aspects of one's medical history in order to determine risk for depression [9]. The APA denotes first-degree family members with major depressive disorder, adverse childhood experiences, neuroticism, and stressful life events as significant to increasing one's risk to developing depression [2]. Stress and fatigue have been found in multiple studies to have a significant impact on the development of depression among pilots [4, 8, 12].

One cross-sectional study found that pilots who experienced longer work hours per week (41 to 45 hours) were twice as likely to develop depression and anxiety than those with fewer work hours per week (less than 25) [4]. Additionally, the presence of early morning shift work has been demonstrated to significantly contribute to increased levels of fatigue and stress [4, 13]. Bostock and Steptoe [13] found that shift work that required waking prior to 0530h contributed to increased amount of the stress hormone as a response to awakening as well as an overall increased amount of cortisol throughout the day. A cross-sectional study by Widyahening [14] interviewing select airline pilots during their medical examinations confirmed the above findings as well as noting that household tension also contributed to overall stress levels and thereby increased risk for depression.

ANTIDEPRESSANT USE IN AVIATION

Antidepressants such as selective serotonin reuptake inhibitors (SSRIs) are commonly used to treat those suffering from depression [15]. However, the FAA was reluctant to grant pilots the use of these medications while on duty primarily due to the underlying medical condition that it was treating [16]. However, on April 5, 2010, the FAA removed this restriction and allowed the use of antidepressants for active pilots. Recent studies into fatal injuries of airmen determined that there is no correlation between SSRI use and flight safety [16]. While a 2016 article by the American College of Physicians recommends both

pharmacologic and cognitive behavioral therapy as effective approaches to treat depression [15], a 2014 statistical survey by the FAA determined that only 0.09% of those seeking certification or recertification that year applied for antidepressant medication use [17].

DISCUSSION

300 million people across the world and currently increasing. This review demonstrates from the studies of Wu et al. [7] that the prevalence of major depression among airline pilots is 12.4% with 4.1% of the sample population reporting suicidal ideations. As this cross-sectional study was based on self-reported data, it is possible that these results be an underrepresentation of true prevalence within the population. Therefore, the medical community must be aware that many active pilots are currently experiencing symptoms that are diagnosable for depression and putting their passengers and crew and increased risk for catastrophic accidents. The underreporting may be due to the stigma associated with mental illness, the onerous process of getting adequate mental health therapy once a diagnosis has been made, or the threat of negative consequences to one's career if depressive symptoms were ever identified [7, 8]. In order for those suffering from depression symptoms to seek treatment, they must first be encouraged that help-seeking behavior will not have negative consequences on their career. Reducing this stress will allow pilots to seek the help they need in a timely manner in order to prevent potentially fatal accidents as a result of impaired judgement or motor functioning.

Antidepressants

The data demonstrated in this review illustrates that there are effective treatments available for depression that do not inhibit a pilots ability to safely operate an aircraft. This includes both cognitive behavioral therapy as well as pharmacological therapy. The process for acquiring approval for antidepressant use while on duty is still arduous despite the research demonstrating minimal risk of flight safety with use of these medications. A reevaluation of the current FAA clearance protocols may be warranted in order for pilots experiencing these depressive symptoms to begin the therapy they need to recover. Additionally, it is interesting to note the differences between the amount of SSRI approvals granted in 2014 by the FAA (0.09%) to pilots seeking medical certification and the percentage of pilots meeting threshold for depression (12.6%) in the 2016 study by Wu et al. [7]. As SSRIs have been allowed by the FAA since 2010, further study is required to better understand the discrepancy between these values.

Risk Factors

There are many known risk factors that have been noted to significantly contribute to the development of depression among pilots. Notably, high occupational stress from increased workloads have been recognized to be a predisposing factor for depressive symptoms. Fatigue

from early morning shift work has been shown to further increase the amount of stress hormone in the body, both at the time of awakening and throughout the day, which ultimately cause an increase in stress levels. This effect is prominent within pilot populations as flights are commonly ranging from early morning to late evening and can cross multiple time zones during the flight. Therefore, although there are regulations currently in effect for shift work limits [18], it is important to keep in mind personal limitations that can be stress-inducing when scheduling extended work hours. Medical examiners must be able to identify other risk factors commonly associated with depression as described above. As such sensitive topics may take time to reveal due to the trust established between the pilot and the physician, it is therefore critical for pilots to be seen consistently with the same provider in order to establish the continuity of care necessary for building a trusting relationship.

CONCLUSION

In conclusion, mental health within the aviation industry is well established and is currently an integral component of the pilot medical certification. However, with recent events such as the crash of the Germanwings flight 9525, the medical community has a continued obligation to improve our understanding of mental health and depression in pilots. This review demonstrates that, though there are guidelines in place to protect passengers and crew from potentially dangerous mental health conditions, much can be improved. Current data have shown predictable risk factors for depression as well as a trend of underreporting of depressive symptoms to authorities for fear of negative consequences to their careers. We must create an environment that we can encourage pilots experiencing these symptoms to divulge this information to seek help and ultimately protect the safety of the millions of passengers these pilots serve.

ABSTRACT

This chapter is a review of current literature and research focused on exploring the impacts of experiences, stressors, and stigma that contribute to mental health and mental illness being underprioritized in the population and within certain vulnerable communities. Specifically, it will be focused on studying various refugee communities, including Afghan, Vietnamese, and Syrian populations, to explain how unique stigmas are perpetuated and why a lack of health seeking behavior is seen utilizing the five hierarchical levels of influence within the Social Ecological Model (SEM): intrapersonal, interpersonal, and combining community, organizational, and societal levels. The paper further examines a few current interventions implemented in different countries that target the different levels of influence on mental health stigma perpetuated within the SEM. In addition, it will show that the lack of resources contributes to only part of the issue of limited health-seeking behavior seen within the refugee community-at-large. Lastly, recommendations in support for further efforts in mental health to reduce mental illness with implementation and future research in developing possible interventions will be addressed in attempts to develop more effective and efficient ways to overcome the current barriers and stigma experienced within refugee mental health.

INTRODUCTION

Mental health, and subsequent mental illness, is a major public health issue today that is underdiagnosed undermanaged on a global scale. Mental health-related issues, like depression, are the leading cause of disability worldwide and is a major contributor to disease burden [1]. Individuals continue to feel stigmatized and isolated from seeking care, especially within the refugee community [2].

By utilizing an ecological model framework, mental illness can be demonstrated on a multilevel system of mutual interaction and influences that contribute to its perceived worth and importance. In particular, the Social Ecological Model (SEM) of health delves into the intrapersonal (individual belief and cognition), interpersonal (family and peers), organizational (community health centers and medical providers), community (identity factors of ethnicity and culture), and societal levels (policy and government) have been explored to better understand the beliefs and barriers of mental health acceptance and health-seeking behavior within this population. Research has indicated that various interconnected factors in the mismanagement of refugee mental health continue to occur and a need for targeted interventions must be implemented if optimal mental health outcomes are to be attainable [2].

MENTAL HEALTH

Numerous studies have been conducted on mental health to assess the current global and national impacts, stigmatization, and interventions that are correlated with the treatment of mental illness, especially within refugee communities. The intricate involvement of multiple factors within the SEM framework has been used within this literature review to describe the barriers and global interventions developed in attempts to improve mental health outcomes for refugees.

DISCUSSION

The most widely accepted definition of health encompasses the complete physical, mental and social wellbeing despite the absence of disease or infirmity [1]. As a result, mental health is an essential piece in achieving optimal health. The burden of mental health and resulting illness is significant and debilitating for an individual and community-at-large [2]. Mental illness has detrimental effects on multiple aspects of health including social and physical wellbeing. Internationally, 25-33% of the population report having at least one mental illness [1]. Within the United States, mental illness affects one in five adults in a given year [3]. About \$193.2 billion in lost earnings are estimated per year due to mental illness [4]. Research [5, 6] has also shown that neuropsychiatric disorders are the leading cause of disability in the U.S. Mental health profoundly impacts an individual's ability to maintain physical health and participate in healthy behaviors [7]. These adverse health behaviors, as a result of mental illness, compromise an individual's ability to live a healthy life. People

suffering from poor mental health and mental illness have been shown to have higher disease and death rates than the general population [8].

Impact of Mental Illness: Refugee Communities

The Refugee experience is a unique situation where an individual has to flee their home due to a variety of compromising positions. Refugee communities end up developing a higher risk of poor mental health leading to illness due to the unique experiences they must endure in fleeing and relocating to a new area along with post-migration experiences within their host country [9]. Extreme conditions of civil war, fear of persecution, and forced displacement, as a result, negatively impact refugee mental health. In 2016, 65.5 million people worldwide were refugees, which has increased from previous years [9]. Pre-and post-displacement factors, such as human rights violations, trauma, and limited access to resource have been found to consequently leave refugees in emotional distress years and decades after resettlement [10]. Recent research [11], indicates that certain risk factors, such as the trauma load experienced by a refugee, affects the severity and likelihood of mental illness. Other research [12, 13] found that social determinants like continued poverty from the post-migration period have also severely impacted the evolution of poor refugee mental health, leaving a lasting effect beyond the resettlement period.

Nevertheless, specific mental illnesses including anxiety, depression, and PTSD were found to be most prevalent in the refugee community due to the to the accumulating circumstances and stressors unique to their experience [14, 15]. accumulating circumstances and stressors unique to their experience [14, 15].

Stigmatization of Refugee Mental Illness and Health Seeking Using SEM

Stigmatization is a social construct that has been an ongoing issue in acceptance and health-seeking behavior within individuals, communities, and societies overall. A couple of factors have been suggested to contribute to the unique stigma seen within refugee mental health and health-seeking behavior. Literature has been reviewed to understand how different levels within SEM influence and affect the overall stigma that is perpetuated within the refugee community as barriers to diagnosing and receiving treatment for mental health.

Intrapersonal level. In general, individuals suffering from mental illness struggle with motivation and behavior [8]. The impact of stereotypes, prejudice, and discrimination all negatively affect an individual's self-determination, beliefs and behaviors toward mental health [8]. This severely influences the intrapersonal level in analyzing the SEM framework, which accounts for non-modifiable (genetics and age) and modifiable characteristics (knowledge, attitude, behavior, and perception) within an individual [2]. One study [8] describes a Regressive Model of Self-Stigma to describe stigma development within an individual through four stages: perceived stigma, agreement with the stigma, self-application of the stigma, and the negative impact on self-esteem and self-efficacy which consequently affects the perception of health seeking. In an already disenfranchised community, refugees are especially susceptible to developing and perpetuating stigma beliefs resulting from

perceived discrimination due to lack of social support, cultural differences, socio-economic issue, and difficulty with asylum processing [16]. As a result, these experiences and circumstances negatively impact the intrapersonal characteristics in accepting mental illness and the likelihood of initiating health-seeking behavior. In further exploring the effects of mental illness stigma on seeking care within an individual, lack of knowledge, insight, and subsequent unawareness of one's mental state acted as a barrier to health seeking [8].

Interpersonal level. Beliefs and expectations within familial and social networks addressing mental illness differ within each ethnic group and refugee experience, but these groups still have a significant influence on mental illness progression and outcomes. Groups within the interpersonal level have been found to endorse stereotypes of mental illness, which results in discrimination amongst friends and family members with mental illness [8].

Interpersonal level. Beliefs and expectations within familial and social networks addressing mental illness differ within each ethnic group and refugee experience, but these groups still have a significant influence on mental illness progression and outcomes. Groups within the interpersonal level have been found to endorse stereotypes of mental illness, which results in discrimination amongst friends and family members with mental illness [8].

Familial Influence. Mental health stigma perpetuated within families for some Asian groups, for example, is due to the collective perception that disabilities of mental illness reflect weakness or flaws within a family [8]. Guo et al. [17] found that Vietnamese American students from refugee families had a significantly higher mental health need when compared to European American students, but were less likely to seek mental health care due to cultural values of family responsibility and correlated shame.

Peer Influence. Another influential group within mental illness stigmatization is one's social network and peers. Social isolation was found to be a salient determinant of mental health amongst older refugees [18]. As a result, there was a higher risk of mental health issues encountered due to more difficulty assimilating to post-migration conditions along with pre-migration stressors within this population [18]. Displacement experienced within the refugee experience disrupts one's original social support in their home country and results in a new social dynamic where they are seen as marginalized and alienated by their peers in their host country [16].

Organization, community, and societal levels. Together, the organizational, community and societal levels of mental health go beyond an individual and their immediate social support network. As a result, they collectively have a more indirect effect on stigmatization that gets transferred down to the interpersonal and intrapersonal level of mental health beliefs and behaviors [2]. Research [16] suggests that the high mental illness rates and continued barriers of coping with mental illness collectively seen within Afghan refugee community are due to their inability to unify as a group to deal with the shame perceived from their new surroundings in the United States. This has contributed to their collective acceptance of being marginalized [16].

Within a health care system, changing demographics secondary to refugee relocation significantly impact medical management and perpetuate a perceived stigma felt within the medical field. The unique healthcare needs, inexperience interacting with the health system unfamiliar to providers, and physically identifiable differences leave providers susceptible to race-based stigma and discrimination in treating this population [19]. Many healthcare settings are not prepared to provide the patient-centered and culturally competent care required for this population, which leads to the under-diagnosing and limited awareness of

mental health in refugee patients [19]. This stigma transfers onto patients who are already hesitant to seek care and more reluctant to speak about mental health illnesses based on intrapersonal and interpersonal influences. Research [20] shows that mental health services in non-war stricken countries who see an influx of refugees are generally more poorly equipped to meet the complex needs of war refugees, as seen within the recent Syrian refugee community in Canada.

On a societal level, government and health policy play significant roles in perpetuating mental health stigma in the general population. Research [2] focused on understanding North Korean refugee attitudes toward mental illness as a group showed that, like other refugee communities, they face the same stressors of economic hardship, discrimination, cultural barriers, and family separation issues, which contributed to their high incidence rates of PTSD, anxiety, and depression [21]. The social restrictiveness and lack of resources available for the treatment of mental illness for the general public in North Korea perpetuated the resistance and lack of knowledge seen after the refugees settled within South Korea. Through strict government restrictions in controlling the nation's media, positive aspects of the society were only allowed to be reported as opposed to negative realities like mental illness [21]. Limitations in mental health services also perpetuate a nation's view of not prioritizing mental health in health policy. Research [22] showed that refugees within Canada, especially the youth population, were found to utilize the emergency department as the first point of contact for mental illness due to their perception and experience of having limited outpatient mental health services available.

SEM Targeted Approaches to Mental Illness Intervention

Some evidence-based services have been demonstrated to be effective in treating mental illness [8]. Globally, many nations have made efforts to implement targeted programs to address mental health across the different levels of the SEM. To target an individual's own stigma beliefs of mental health and health seeking, the World Health Organization [23] has developed a self- help program targeting changes in behavior and beliefs within the intrapersonal level while providing scalable mental health interventions within settings with limited resources faced in refugee post-resettlement. By educating and empowering the individual, they became more proactive in seeking help and accepting their mental illness rather than perpetuate the stigma that they previously believed. On an interpersonal level, research [24] showed the success of an integrated community and primary care approach with dedicated mental health services that had properly trained medical teams in cultural competency to alleviate the stigma and perceived discrimination felt within the refugee community when attempting to access care within a foreign country. Other research [20] targeting medical providers suggests the need of a transcultural approach to mental health services, targeting practice-based skills needed in trauma- informed care beyond cultural competency to meet the needs of refugees effectively. Lastly, a broader approach of achieving support from leadership and co-coordination within a national, regional, and district level of government was required in successfully addressing widespread stigma and low mental health awareness in refugee-origin countries like Ethiopia [25].

There is no doubt that mental health is a major influencer in the outcome of health for any individual. In addition to the debilitating effects it has on an individual's productivity, state of mind, and future health outcomes, there is an issue of mental health being underdiagnosed and undertreated globally [8]. This issue is magnified when focusing further on the vulnerable population of refugees that continues to grow to this day due to civil war and political persecution [20]. Refugee mental health is a multilayered and complex issue [20]. The unique stressors from violence, fear, trauma, and loss felt before and during relocation combined with the post-relocation experiences such as discrimination, resource instability, and cultural isolation from a sponsor nation contribute to their higher likelihood of mental illness [11]. As a result, it is not surprising to see higher rates of depression, anxiety, and PTSD reported within refugee communities [14]. Mental health needs for this community is greater and will continue to exceed the requirements of those from non-refugee origins because of the unique stigmatization and perceived marginalization experienced after refugees resettle within a sponsor nation [16].

Utilizing SEM, intrapersonal factors of one's own beliefs, education, and self-stigma toward mental health influences their likelihood to accept and eventually seek care [2]. By internalizing the negative perception of mental health illness and applying it to one's own beliefs, self-esteem and self-efficacy become compromised. Subsequently, the value and need for seeking care are no longer considered [8]. When analyzing the interpersonal level of family and social support, certain refugee communities which value family at a higher level stigmatized mental illness and endorsed it as a flaw that reflects upon their family's reputation resulting in lack of health seeking behavior [17]. Social support in refugee communities have also been lacking due to the nature of relocation and losing a pre-establish social population from their origin country. Research [18] revealed that older refugee communities are likely to experience social isolation and lack social support to encourage them to accept and seek care for their mental health showing the impact of one's social network. Lastly, analyzing organizational, community, and societal levels together demonstrated the broad influence of reinforcing stereotypical beliefs and marginalization seen within the public. Research [16] showed how the distress felt from an Afghan refugee community within California contributed to perceived discrimination and marginalization that perpetuated mental illness but stigmatized mental health and subsequent care within the sponsor community. Other research [19] showed an inherently biased and prejudice within the health system and healthcare providers due to lack of cultural competency and training to deal with this community. Lastly, societal impacts of government power controlling social perceptions, as seen in research [21] studying North Korea refugees in South Korea, reinforced the stigma and negative association of mental health that was accepted within this population. Interventions have been developed targeting the different levels of SEM involved with stigmatization and subsequent lack of health seeking behavior [2]. Various studies [20, 23-25] have demonstrated interventions involving self-empowerment programs, transcultural approaches in proper provider training, implementation of dedicated mental health services within the community, and ensuring adequate support from leadership in a variety of refugee communities to improve refugee mental health.

Mental health resources within health systems are inadequate on a global standpoint [1]. As a result, more interventions and resources need to be provided for all individuals who have a mental illness, especially those within high-risk populations like refugees. Unfortunately, there has been recent research [17] indicating that providing interventions within the refugee

community are not enough to effectively overcome refugee mental health stigma and lack of health seeking. Research [17] showed that increasing mental health resources was correlated to increase health seeking in European groups, but not within Vietnamese refugee communities, suggesting that other refugee-specific factors need to be considered in developing interventions [17]. Despite the existing evidence-based services for refugee mental health already used in practice, many refugees still do not seek the care they need because of the overwhelming influence of stigma [8].

CONCLUSION

Refugees are part of a vulnerable population seen within mental health and illness that are need of cultural competency, support, and acceptance amongst all levels within the SEM. To adequately understand the complexity of refugee mental health requires the acknowledgment and awareness that personal beliefs, family, social groups, communities, health care providers and national governments all perpetuate the stigma perceived in mental illness and health seeking.

As a result, there is no simple solution to providing mental health services for this community as each ethnic group and individual has a unique refugee experience. Research needs to target refugee-specific interventions that emphasize effective changes in stigma on a multitude of levels and promote cultural competency. Lastly, research needs to explore what specific aspects are required to be addressed by policymakers in developing health policy to better prepare a nation for the influx of refugee needs and refugee mental health care. By implementing better policies and laws to protect refugee rights and resources, it will inevitably cause a trickle-down effect on the community, family and individual level to hopefully promote mental health acceptance and health-seeking behavior.

Chapter 70

**ENVIRONMENTAL ATRAZINE EXPOSURE
AND ENDOCRINE HEALTH:
IMPLICATIONS FOR RURAL COMMUNITIES
IN MIDWESTERN UNITED STATES**

Erica Ray, MPH and Kerry Mitchell*, PhD

Department of Public Health and Preventive Medicine,
St. George's University School of Medicine, St. George's, Grenada

ABSTRACT

Pesticides are used daily in agriculture to limit the amount of unwanted plants and organisms in crops. Atrazine (6-chloro-N-ethyl-N'-(1-methylethyl) -1,3,5-triazine-2,4-diamine), a well-known and controversial pesticide used in the United States, is classified as a herbicide in the triazine family. Although its use is advantageous in the production of corn in midwestern United States, atrazine poses a threat to individuals due to its endocrine disrupting health effects and persistence in water systems. By extrapolating data from animal models, potential public health implications in humans can be hypothesized. The results of this review attempt to demonstrate the current gaps in the assessment of risk and potential health implications of continued atrazine use among individuals living in midwestern United States.

INTRODUCTION

Pesticides are subdivided into several broad categories, including insecticides, herbicides, biopesticides, rodenticides, and fungicides to name a few [1]. Herbicides are used specifically to limit the quantity of weeds in agricultural crops and are classified based on their effect on specific plant metabolic processes, such as lipid synthesis, amino acid synthesis, and growth

* Corresponding Author's Email: kmitch3@sgu.edu.

regulator inhibitors, in addition to the chemical family each herbicide belongs to [2]. Atrazine, a widely used herbicide in the United States, is classified in the triazine chemical family and acts as a photosynthesis inhibitor by inhibiting the photosystem II, a system crucial for energy production in plants [3].

Atrazine was first registered for use in the United States in 1958 and since then, has played an important role in agriculture, specifically corn production in midwestern United States, as well as weed control in sugarcane, pineapples, sorghum, macadamia nuts, and evergreen trees [2, 4]. In 2016, approximately sixty million pounds of atrazine was applied to corn crops in the United States, with concentrated application in the midwestern United States, a region known as the “corn belt” [5]. In the state of Iowa, out of the 97% of herbicides applied to corn fields, 58% were applied with atrazine [6]. Commercial use of atrazine for corn production has shown to increase the yield and market value of corn, as well as play an environmental role in the reduction of soil erosion through conservation of tillage [4, 7]. Due to these facts, atrazine has proved to play an important role in the production of corn in midwestern United States.

Application of atrazine occurs through one of two methods: aerially via plane or helicopter or sprayers mounted on tractors [8]. The method of application depends on terrain, soil type, and crop; however, mounted sprayers are recommended due to lower rates of drift to surrounding areas [8]. For atrazine to properly elicit effects, it must dissolve in the liquid phase of soil to become activated, allowing for entry into roots of unwanted plants [2]. Following activation, atrazine has a half-life of approximately four months in surface water and demonstrates little biodegradation during this time period [2, 3]. However, when present in surface soil, atrazine shows little persistence due to interactions with sediments and demonstrates a significantly lower half-life, ranging from half a month to three months [2, 9]. Nonetheless, atrazine can be classified as persistent in the environment when in surface waters and poses a potential threat to the public health of surrounding communities.

Individuals can become exposed to atrazine through contaminated water systems via runoff from nearby fields, direct exposure during the application process, living near fields where atrazine was applied and digging in atrazine applied dirt [2]. Following exposure to atrazine, potential health implications becomes a grave concern for the surrounding population. In both human and animal models, the endocrine, or hormonal, system acts as the major target for atrazine [3]. The endocrine system is made up of the pituitary gland, adrenal glands, thyroid gland, parathyroid gland, and portions of the pancreas [10]. Atrazine has been shown to have direct implications on both the pituitary and thyroid glands through interference of circuitry and hormones necessary for growth and reproduction [10–13]. Despite compelling evidence regarding endocrine and reproductive disruption following atrazine exposure in animal models, little evidence remains for the carcinogenic effects in human populations, thus the International Agency for Research on Cancer has classified atrazine in Group 3, a group considered not carcinogenic to humans [14].

Concern surrounding the health implications of atrazine fuels the controversial discussion between its advantageous uses in agriculture and its disadvantageous effects in human health. In the European Union, atrazine is banned due to persistent water contamination and the evidence of atrazine acting as an endocrine disruptor [15, 16]. On the other hand, in the United States, atrazine is legal, but is considered a restricted use pesticide, meaning that only registered professionals can purchase and use it [2, 3]. Due to concern of implications associated with atrazine, several regulations and programs are in place in the United States to

monitor pesticides, such as the development of the Iowa Groundwater Protection Strategy directed by the Iowa Department of Natural Resources and the Pesticide Environmental Stewardship Program directed by the Environmental Protection Agency [3, 4]. Regardless, discussions and future research demonstrating the public health implications associated with atrazine exposure must continue to allow for a holistic review of the role atrazine plays in United States' agriculture.

The aim of this review was to establish the link between atrazine exposure and the potential for endocrine disruption in humans, identify sources of exposure and risks of exposure to atrazine in midwestern United States, examine and compare current views on atrazine exposure in the United States and European Union, with a view to identifying knowledge gaps and elucidating the implications for population health in midwestern United States.

OUR SEARCH

General supporting information on pesticides and atrazine were sourced on government websites and scientific textbooks, including the Environmental Protection Agency, Agency for Toxic Substances and Disease Registry, United States Department of Agriculture, and International Agency for Research on Cancer. Information and documents from these websites aided in defining the role of atrazine in agriculture, specific uses of atrazine, and regulation of atrazine usage. Specific studies were identified by searching the PubMed database using the key word “atrazine exposure” in combination with “endocrine system,” “endocrine disruption,” “pituitary,” “thyroid,” and others. Information from these studies guided the discussion on the health implications associated with atrazine exposure. 226 citations were identified through the combination of the mentioned keywords (see Figure 1). Out of the 226 citations, forty-five had full read text available (see Figure 1). Titles were then screened based off inclusion of atrazine and topics related to the endocrine system. After a final review of titles and abstracts, ten relevant studies were identified that examined the relationship between atrazine exposure and endocrine disruption (see Figure 1).

Figure 1. Diagram for identification of literature sources (adapted from Nahar et al, 2018).

Inclusion and Exclusion Criteria

Studies were included based on exposure to atrazine, amount of exposure to atrazine, and implications associated with the endocrine system, such as decreased tissue size, decreased production of hormones and disruption of hormonal circuitry. Due to the limited number of studies examining the effects of atrazine exposure in humans, the results were extrapolated from animal models for the estimation of risk in humans. Additionally, due to limited number of recent studies in both human and animal models, studies from 2000 to 2018 were considered. Studies were excluded based on exposure to pesticides beside atrazine, results that did not include the endocrine system, and studies that did not include full read text.

FINDINGS

Results from the Agricultural Health Study were among the first used to evaluate the adverse health effects associated with long-term pesticide exposure, such as leukemia, non-Hodgkin's lymphoma, and prostate cancer to name a few [17]. Since the Agricultural Health Study, a multitude of studies have elaborated on those health implications, especially those related to atrazine. Humans have demonstrated decreased levels of pituitary hormones, shortened estrous cycle length, reduction of luteinizing hormone surge, and ovarian pathologies, all of which result in regulatory disruption of endocrine and reproductive systems [18]. Experimental animal models have demonstrated similar effects, especially in mice and fish models (see Table 1). In addition to the specific disruption of the pituitary and thyroid glands, animal models have also demonstrated induction of inflammatory responses, abnormal expression of genes involved in structural stability and stress regulation, neurotransmitter disruption in the brain, and feminization of male species [19–21]. These findings aid in the discussion of potential atrazine toxicity in humans outside the scope of the endocrine system.

DISCUSSION

Effects of Atrazine Exposure on the Pituitary Gland in Animal Models

The role of the pituitary gland is to receive signals from the hypothalamus, produce hormones, and release hormones which are then sent out to other parts of the body. Hormones produced and released from the pituitary gland play pivotal roles in growth and reproduction; therefore, interference with these processes can severely disrupt an organism's ability to grow and reproduce properly [10].

Due to disruption of the pituitary gland and processes associated with reproduction, atrazine exposure during specific time periods in life resulted in severe disruption of reproductive processes in zebrafish and mice models (see Table 1) [12, 22, 23].

During embryonic exposure to atrazine in male mice, Hao et al. [23] discovered decreased numbers of spermatozoa and disruption of meiosis and spermiogenesis, key processes in the growth and reproduction of male mice. Researchers also discovered that offspring of these atrazine exposed mice can have altered genes involved in the same processes [23]. Thus, Hao et al. concluded that genetic changes caused by atrazine exposure can potentially transfer across generations, creating a worrisome discussion when applied to human populations [23].

During pre-pubertal exposure, Weber et al. discovered altered genes for organ and reproductive development of both testis and oocytes in zebrafish, as well as abnormally smaller adrenal glands, prostate, pancreas, and kidneys (see Table 1) [22]. Identification of these altered genes can aid in defining mechanisms for atrazine toxicity in human models. Lastly, during adult exposure to atrazine, researchers discovered oxidative stress in oocytes and disruption of follicle formation in female mice, a process crucial to the reproductive capability of organisms [12]. These results can pose a threat when applied to human models, especially atrazine exposed women who intend to become pregnant.

Decreased growth hormone expression has also been observed as a result of direct pituitary gland disruption. Fakhouri et al. studied the effects of pre-pubertal exposure in rats by exposing pituitary cells to various levels of atrazine (see Table 1) [11]. Atrazine exposure resulted in abnormally low levels of genes that encode for growth hormone and luteinizing hormone, hormones responsible for growth and gonadal development, as well as decreased circulating levels of these hormones in adult rats [10, 11]. Atrazine is able to cause these effects through direct disruption of the pituitary gland “by binding to the growth hormone releasing hormone receptor and inhibiting GH [growth hormone] expression at the mRNA and protein levels” [10]. According to researchers, this was the first time a specific receptor for atrazine was identified, serving as a framework for future research on atrazine exposure in humans [11].

Effects of Atrazine Exposure on the Thyroid Gland in Animal Models

The thyroid gland is an endocrine organ that secretes thyroid hormones and plays an important role in the regulation of metabolism [10]. Pesticides are one of the major toxicants that can interfere with the circuitry and production of hormones by the thyroid gland [10]. Studies conducted by Rajkovic et al. [13], Stoker et al. [24] and Laws et al. [25] researched the effects of atrazine exposure on the thyroid gland in rat models.

Stoker et al. [24] discovered no adverse effect on the thyroid glands of rats at pre-pubertal and adult atrazine exposure but did discover abnormalities in the developmental of male rat genitalia (see Table 1). It was shown that male rats exposed to atrazine had delayed preputial separation, decreased weight of prostate, and decreased circulating levels of testosterone. However, Rajkovic et al. [13] found compelling evidence for thyroid damage due to peripubertal and adult atrazine exposure in rat models (see Table 1). Following different exposure concentrations to atrazine, rat thyroid mast cells were shown in decreased amounts due to the cells destroying and expelling their cellular contents, a process known as degranulation [13]. Normally, mast cells function as mediators of allergic and immune responses, saving organisms from adverse effects caused by toxicants [26]. By understanding the disturbance of thyroid functions in animal models, such as the studies conducted by Stoker et al. [24] and Rajkovic et al. [13], future researchers can investigate the potential thyroid disturbances and threat atrazine poses on human populations.

Environmental Distribution of Atrazine

These well documented adverse effects of atrazine exposure represent a serious risk to the public health of communities in the United States especially when considered in the context of its fate and transport in the environment. In a study conducted by the EPA on contaminants in ground water, atrazine was found as a common contaminant in several regions, especially the Midwest [1]. In Iowa, it was found that 8% of private drinking water wells were contaminated with low concentrations of atrazine [27]. However, contamination levels in drinking water did not exceed the EPA Maximum Contaminant Level of 3 µg/L, adapted from the original World Health Organization guidelines set at 2 µg/L [18].

Table 1. Effects of atrazine exposure on the endocrine system and other

Reference	Model	Exposure	Time Frame of Exposure	Age at Exposure	Major Endocrine Findings and Conclusions/Implications Related to Human Health
Weber et al., 2013	Animal (zebrafish)	0, 0.3, 3, or 30 ppb (µg/kg)	1 to 72 hours post fertilization	Embryonic	Major Findings: Altered genes (transcriptomes) responsible for organ and reproductive development (testis, oocytes); congenital adrenal hyperplasia; carcinogenesis for prostate, pancreas, kidneys Conclusion: Identification of altered genetic targets can aid in defining mechanisms for atrazine toxicity
Hao et al., 2016	Animal (mice)	100 mg/kg/day	9 days	Embryonic	Major Findings: Decreased spermatozoa, disrupted meiosis (spermiogenesis), impaired RNA expression Conclusion: Genetic changes that result from atrazine exposure can transfer across generations.
Gely-Pernot et al., 2017	Animal (mice)	100 mg/kg/day	9 days	In utero and adult	Major Findings: Oxidative stress in oocytes disrupts processes associated with meiosis; delay of puberty due to disruption of hormones; disruption of follicular development and reduction of follicles in female mice Implication: Pregnant women exposed to atrazine can have babies with lower birth weights
Fakhouri, Nunez, and Trail, 2010	Animal (rat)	1 ppb (µg/kg) and 1ppm (mg/kg)	7 days	Pre-pubertal	Major Findings: Pituitary cells exposed to atrazine resulted in decreased levels of genes encoding for GH and LH Conclusion: Atrazine targets GHRHR of pituitary cells and decreases levels of GH. To the knowledge of the researchers, this is the first time a receptor has been identified. This can aid in future research on atrazine exposure.
Stoker et al., 2002	Animal (rat)	6.5, 12.5, 25, 50, 100, 200 mg/kg/day	Post-natal depression (PND) 23 to 53 days	Pre-pubertal and adult	Major Findings: Delayed preputial separation; Decreased weight of prostate and anterior pituitary; Decreased serum testosterone levels; No effect on the thyroid Conclusion: Both atrazine and its metabolites alter the development of puberty in male rats and can pose a potential threat to human populations

Reference	Model	Exposure	Time Frame of Exposure	Age at Exposure	Major Endocrine Findings and Conclusions/Implications Related to Human Health
Rajkovic et al., 2012	Animal (rat)	50 and 200 mg/kg/day	28 days	Peripubertal and adult	Major Findings: Degranulation of thyroid mast cells; Decrease in the density of thyroid mast cells Conclusion: Results provide framework for future research that investigates the role atrazine exposed mast cells play in thyroid function
Laws et al., 2000	Animal (rat)	50, 100, 200 mg/kg/day	PND 22 to 41 days	Pre-pubertal	Major Findings: Decrease in body weight and weight of kidneys, adrenals, pituitary gland, and uterus; Delayed age of vaginal opening; Delayed menstrual cycle Conclusion: Results aid future research on the effects of atrazine exposure on the central nervous system and the hormonal control of gonads
Mizota and Ueda, 2006	Animal (mice)	.0001 – 1.0 µM	0 – 20 minutes	Pre-pubertal	Major Findings: Induction of inflammatory effects, mast cell degranulation and action of Gq/11-protein coupled neurosteroid receptor, PLC and intracellular Ca ²⁺ mobilization
Huang, Yang, and Song, 2014	Human (female breast cells)	0.1 µg/mL (100 ppb)	3, 6, and 12 hours	Adult	Major Findings: Abnormal protein expression of genes involved in signaling, protein translation, gene transcription, structural stability, stress regulation, and glycolytic metabolism; changes in genes necessary for growth and development; acetylcholinergic and dopaminergic system dysfunction in the brain Conclusion: Exposure to environmentally relevant concentrations of atrazine cause dysregulation of several processes; however, mechanisms of action are unclear and future research is needed
Suzawa and Ingraham, 2008	Animal (zebrafish)	.1, 1, 10 µM	6 months	Pre-pubertal and adult	Major Findings: Feminization of male fish; Increased number of genes involved in endocrine signaling in adrenal cell lines, human liver cell lines, and primary endometriotric cell lines Conclusion: Atrazine exposure affects hormone signaling and endocrine networks in fish and can potentially disrupt similar circuitry in more advanced vertebrates (i.e. humans)

Rice et al. [9] studied the degradation process for atrazine to determine if the presence of sediments in water altered the half-life of atrazine. Atrazine can persist in the environment for approximately four months [9]. The authors discovered that levels of atrazine in surface water containing sediments were significantly lower compared to water free of sediments. Results demonstrate that sediments present in water can play a synergistic role in the degradation process of atrazine and can serve as a foundation for future public health studies looking at the persistence of atrazine in water systems.

Atrazine Monitoring and Regulation

In midwestern United States, atrazine exposure through contaminated water systems is estimated at the level of 0-3 µg/L, based off the EPA Maximum Contaminant Requirements [18]. This means that concentrations of atrazine in water sources can vary depending on the time course of atrazine application and persistence of atrazine in water sources. This creates a public health issue for individuals using private water wells as their main source of drinking water, as private wells may not undergo the same amount of monitoring as larger water systems do. It remains important to identify communities in midwestern United States as a susceptible population to atrazine exposure due to the fact that atrazine is heavily applied to corn crops in this area.

Monitoring levels of atrazine in the environment remains an important aspect due to the persistence of atrazine in surface water and the public health threat this causes to surrounding communities. Unfortunately, monitoring levels of water contaminated with atrazine can prove difficult in the United States, especially in areas, such as Iowa, where are a large number of individuals receive their water from private drinking wells. From 2006 through 2008, the University of Iowa Center for Health Effects of Environmental Contamination conducted a survey to sample private drinking wells throughout several counties in Iowa [27]. In all the wells sampled, 8% had low concentrations of atrazine present. The survey also noted that wells less than 100 feet deep and wells constructed before 1991 had higher detectable levels of herbicides compared to deeper and newer wells. In addition to private drinking wells, atrazine has also been detected year-round in streams of the Midwest United States, posing a risk to the various wildlife living in and near these streams [9].

In the United States, the production and usage of pesticides is monitored by the United States Department of Agriculture. Following the 1990 Farm Bill, the United States Department of Agriculture required private applicators, by law, to keep a detailed record of application of restricted use pesticides, including atrazine [6]. Unfortunately, due to budget cuts, this program, known as the Pesticide Record Keeping Program, was eliminated in September 2013 [6]. In 1994, the Environmental Protection Agency established the Pesticide Environmental Stewardship Program with hopes of reducing the risks of pesticide risks in the United States [1]. Currently, the Pesticide Environmental Stewardship Programs has several initiatives aimed at reducing pesticide risks in every sector, including school education programs, landscaping initiatives, and tick monitoring [1]. Although this program does not single out atrazine, it does provide an educational framework for individuals unaware of the risks associated with pesticides.

When discussing regulations of atrazine in the United States, it remains useful to view the state of atrazine in other parts of the world. Currently, atrazine is banned in the European Union due to the unpreventable nature of repeated water contamination, as well as the discovery of atrazine as an endocrine disruptor [15, 16]. In 1999, the European Union began its discussion of regulating hazardous chemicals, such as chemicals that act as endocrine disruptors, by creating a series of categories to classify hazardous substances [15]. In addition, information regarding safe drinking water and contamination with hazardous substances spawned further discussion in the European Union regarding its role in agriculture [15, 16]. During the late 1990s to mid-2000s, the European Union conducted several reviews of atrazine regarding its adverse health effects and water contamination. Although the evidence regarding the adverse health effects of atrazine in humans was inconclusive, due to its persistence in environmental media, the European Union still voted to ban atrazine in 2003, with the exception of essential use in parts of the United Kingdom and Ireland for forestry and maize use until 2007 [15]. Fifteen years following the European Union's decision to ban atrazine, organizations in the United States, especially the EPA and USDA, still continue to discuss the role of atrazine in agriculture in the United States.

CONCLUSION

The results of the reviewed studies identify a multitude of health implications associated with atrazine exposure, specifically disruption to the pituitary and thyroid glands. These tissues are crucial to human development and processes involved with the regulation of growth, reproduction, and metabolism. Although little research has been conducted in humans, results extrapolated from animal models provide compelling evidence for potential health implications in human populations. This information, coupled with the persistent nature of atrazine and regulations of atrazine worldwide, aids in the public health discussion of atrazine and the role it plays in humans and the environment. This review addressed the knowledge gaps of atrazine in the United States and provides insight for the need of continued research on atrazine and its effects on human populations.

ABSTRACT

There has been notable progress in the eradication of communicable diseases in the Caribbean islands. The region, however, still faces public health challenges from endemic and emerging infectious diseases. There were differences in the health outcomes between the Windward Islands. In this chapter, health status is compared in the islands to indicate progress in addressing communicable diseases. Comparing data in the Pan American Health Organization database for the years reported, the lowest overall rate of mortality from communicable diseases was in St. Lucia and the sharpest decline in rates was in St. Vincent and the Grenadines between 2010-2015. There was a notable decline in HIV mortality rate from 44.5 per 100000 population in 2000 to 20.3 in 2015 in St. Vincent and the Grenadines. The tuberculosis mortality rate was especially low, less than 2 per 100000 population, in all the islands except in St. Vincent and the Grenadines which had a slightly higher rate. Reported cases of dengue increased sharply in each island. There were slight increases in leptospirosis cases, except in Grenada. From 1995-2012, cholera cases were not reported in any of the islands. Apart from Grenada and St Lucia, measles cases were not reported after 1990 in any of the other islands. The factors that account for the differences in health status between the islands should be further examined. Local and

* Corresponding Author's Email: linglasg@yahoo.com.

regional health agencies should also facilitate more robust reporting, sharing information on best practices, and interventions to address challenges related to achieving SDG #3, health for all.

INTRODUCTION

The Windward Islands (WI), comprising of four independent island states - Grenada, St Vincent and the Grenadines, St Lucia, and Dominica - are located in the southern part of the Caribbean archipelago. The small islands have a total population of 472,000. The demographic, social and economic landscape of the islands are generally similar. Within close proximity, the WI also commonly experience similar issues related to the spread and burden of communicable diseases. Various factors, however, contribute to differences in health status between the islands.

Overall, the Caribbean islands made great strides in combating communicable diseases. The last cases of measles occurred in the WI in 1995 and cases of cholera were not reported from about the mid-1990s [1]. Polio was eradicated in the Caribbean region from 1991 although a few cases were diagnosed in Haiti and the Dominican Republic in 2000 [2]. Rubella was not diagnosed in the region since 2002 [3]. The successes in eradicating communicable diseases are attributable to a vaccination coverage of 94% - 100% over the last ten years for communicable diseases like measles and polio [1]. Improvements in access to water and sanitation services, nutrition and primary health care were also recognized by the Pan American Health Organization (PAHO) as having a significant part in contributing to control and eliminate the spread of diseases in the Caribbean region [4].

Despite the notable progress in curbing some infectious diseases, there is still a relatively high prevalence of other diseases in the WI and other regional countries, indicating that health challenges persist in the Caribbean region. A major challenge still facing the WI and the Caribbean region, in general, is the emergence and re-emergence of vector-borne diseases such as dengue, Chikungunya and Zika [5, 6]. In the last decade, there were recurrent outbreaks of dengue every 3-5 years in the Americas with a major outbreak in 2010 [6]. Chikungunya virus infections rose to epidemic proportions in 2013 and, two years later, in 2015, the Zika virus epidemic was declared in the region [5]. Data in the PAHO database shows the highest number of reported cases of dengue in 2010 in each of the WI [1]. The increase in dengue transmission in the Americas (including the Caribbean) is linked to the increased spread and multiplication of the *Aedes aegypti* mosquitoes (vector for dengue) throughout the Americas [5]. The presence of all four serotypes of dengue (DENV 1, 2, 3, & 4; previously only 2 & 3 were present) was associated with the failed eradication program in 1947 – 1970 [6].

Tuberculosis, leprosy, cholera and leptospirosis were of concern since the late 1980s [7]. Two of those diseases, tuberculosis and leptospirosis continued to be of concern in the region as relatively consistent rates of infection were reported to PAHO [1]. High prevalence of sexually transmitted infections (STIs), in particular HIV, is another major infectious disease challenge in the WI [8]. HIV disease is the primary cause of death among Caribbean people aged 25 years to 44 years [9]. Albeit, there was success in reducing the rate of mother-to-child transmission, increased use of drug therapy, increased use of condoms by female sex workers, and improved safety in blood transfusion processes [9]. In general, there has been a shift in

focus away from communicable to non-communicable diseases. Nonetheless, the continuing high prevalence of HIV and other infectious diseases warrants more attention to communicable diseases in the Caribbean region [3].

This study was conducted to compare morbidity and mortality from communicable diseases in the four WI. The study focused on six diseases that have had major impacts on health and the health care systems in the sub-region, that is, HIV, tuberculosis, dengue, leptospirosis, cholera, and measles. Data was extracted from PAHO's database, spanning the period 1990-2016, and compared to provide an indication of progress in addressing communicable diseases in the region. The authors also discussed the implications for achieving Sustainable Development Goal (SDG) #3 - good health for all - in the WI.

OUR STUDY

This study constitutes a review and comparison of data on health outcomes related to six communicable diseases that have had major impacts on health and the health care systems in the sub-region - HIV, tuberculosis, dengue, leptospirosis, cholera, and measles. The data was extracted from PAHO's electronic database to compare morbidity and mortality rates and the number of deaths from communicable diseases [1]. The authors compared data, as provided by the countries, at six points - 1990, 1995, 2000, 2010, 2015, and 2016. Mortality data were reported for the years 2000-2015 in Dominica, 2000-2012 in St Lucia, 2010-2016 in Grenada, and 2000-2015 in St Vincent and the Grenadines. Mortality data were reported for dengue, tuberculosis and measles from 1990-2016. For the other diseases, data was provided for 2015-2016. Data on morbidity from cholera were reported for all the islands in 1995-2012. Gender disaggregated data is also reported in this study, but not shown. The results provide an indication of trends in health status over the extended period and show differences that indicate progress in addressing communicable diseases in the sub-region. The authors discuss the implications for achieving SDG #3 - good health for all - in the individual islands and, collectively, in the WIs.

FINDINGS

In the years reported, the mortality rate from communicable diseases was mostly steady in St Lucia, which also had the lowest overall rate among the four islands. In Dominica, there was an increase in the rate from 89.7 in 2010 to 111.5 per 100,000 population in 2015. Over the same period, the rate of mortality from communicable diseases also increased slightly in Grenada from 90.8 to 107.3 per 100,000 population but decreased to 89.9 per 100,000 in 2016. In St Vincent and the Grenadines, there was a sharp decrease in the reported rate from 2010-2015. Over the years, the reported mortality rate show decrease among females and increase among males in Dominica and was consistently higher among males in St Vincent and the Grenadines, Grenada, and St Lucia.

Table 1. Total mortality rate from communicable diseases and from HIV and tuberculosis infections in the Windward Islands

	1990	1995	2000	2010	2012	2015	2016
Total Communicable Diseases Mortality Rate (100000 population)							
Dominica	-	-	-	89.7	108.1	111.5	-
Grenada	-	-	-	90.8	97.7	107.3	89.9
St. Lucia	-	-	67.3	66.4	69.2	-	-

St. Lucia	9.4	7.5	5.7	5.2	6.3	7.9	1.7
St. Vincent and the Grenadines	1.9	12	14.8	13.7	27.4	6.4	5.5
Reported Cases of Cholera (total)							
Dominica	-	0	0	0	0	-	-
Grenada	-	0	0	0	0	-	-
St. Lucia	-	0	0	0	0	-	-
St. Vincent and the Grenadines	-	0	0	0	0	-	-
Reported Cases of Measles (total)							
Dominica	13	0	0	-	0	0	0
Grenada	6	3	0	-	0	0	0
St. Lucia	30	2	0	-	0	0	0
St. Vincent and the Grenadines	1	0	0	-	0	0	0

There was a notable decline in HIV mortality rate in St Vincent and the Grenadines from 44.5 per 100,000 population in 2000 to 20.3 in 2015. The HIV mortality rate was consistently higher among males in all countries. The reported tuberculosis mortality rate was extremely low, less than 2 per 100,000 population in all the islands, with slightly higher rates in St Vincent and the Grenadines, 3.7-5.7 per 100,000 in 2000-2012. The rate, however, dropped to 0.9 per 100,000 population in 2015. The HIV mortality rates were significantly higher among males in St Vincent and the Grenadines. Table 1 shows the total mortality rate from communicable diseases in the four islands and the mortality rate from HIV and tuberculosis infections.

Morbidity from Communicable Diseases

Between 2015-2016, the total HIV diagnosed rate increased slightly in Dominica but decreased slightly in Grenada over the same period. The most significant decrease in new diagnosis was in St Vincent and the Grenadines over the two-year period from 61.2-32.8 cases per 100,000 population. The highest number of reported cases was among males in each island. In each island, the number of reported cases of dengue increased sharply over the years reported. There were also slight increases in reported cases of leptospirosis in all the islands, except in Grenada. The incidence rate of tuberculosis decreased in Dominica and St Vincent and the Grenadines in 2015-2016. From 1995-2012, cholera cases were not reported in any of the islands. Apart from Grenada and St Lucia, measles cases were not reported after 1990 in any of the other islands. Table 2 shows data on morbidity related to communicable diseases.

DISCUSSION

It is evident that while noncommunicable diseases have surpassed communicable diseases as the major cause of death and disease, the latter still poses a major challenge to the health systems in Latin America and the Caribbean [10]. Communicable disease mortality rates in the WI, in general, are more than double what is seen in North America [2]. Consequently, these resource-limited small island nations must find the wherewithal to address simultaneously both communicable and non-communicable diseases. At the same time, governments must prioritize the provision of basic services for citizens. Addressing the high prevalence of communicable diseases and risk factors can place severe strain on the small and fragile economies of Caribbean countries, including the WI.

Many of the health achievements made in the WI, and in the Caribbean as a whole, are as a result of solid regional and international partnerships [11]. It is well recognised that the first sub-region in the Americas to eliminate poliomyelitis and the first to eliminate indigenous measles and rubella was the Caribbean [11]. Notwithstanding these achievements, because of their small scale, a common feature among these islands is a lack of both human and financial capacity to provide health services. Through PAHO, the World Health Organization provided technical and financial support for many years to the countries to address both communicable and noncommunicable diseases and their determinants. Other organizations and donor

agencies such as the Caribbean Community (CARICOM), President's Emergency Plan for AIDS Relief (PEPFAR), United Nations Programme on HIV/AIDS (UNAIDS) and the Pan Caribbean Partnership Against HIV and AIDS (PANCAP) have contributed significantly through cooperation in health for the reduction in the incidence of diseases, such as HIV, and to improve conditions and the standard of living of individuals. The Windward Islands still stands to benefit more from this regional approach to address communicable diseases. In the absence of benefiting from technical cooperation and financial support, it is difficult for small island states, such as the WIs to achieve SDG #3 - Ensure healthy lives and promote well-being for all at all ages.

Some infectious diseases like measles and cholera have been eliminated in the WI for over a decade [1]. Effective vaccine coverage, availability of clean drinking water and improved sanitation contributed to the reduction in communicable disease prevalence [12–14]. The HIV mortality rate decreased in the WI between 2010 and 2015, except in St. Vincent and the Grenadines (but the rate is lower than in 2000) [1]. The decline in the mortality rate has been as a result of improved prevention and control programs, for example, early initiation of antiretroviral therapy (ART) [8]. Good progress has been made in the fight against HIV in the Caribbean region, including in the WI, but significant work still needs to be done. The incidence of tuberculosis increased in the 1990s and early 2000s, then started decreasing by 2015 in the Windward Islands [1]. The increase may have been mainly due to co-morbidity with HIV infection. Improved control programs may have led to the eventual decrease in cases of tuberculosis.

Insufficient and ineffective vector control programs and the effects of globalization are factors that may have contributed to the increase in vector-borne illnesses in the WI [12, 15]. The WHO encourages governments to foster and enable social and health equity to improve health outcomes through three main measures: 1) improve daily living conditions, 2) tackle the inequitable distribution of power and resources and 3) measure the scope and magnitude of the problem and assess the impact of action [16]. SDG #17 promotes multi-national partnerships for sharing resources to facilitate poorer countries to achieve the goals including creating the environment for the healthy development of individuals [17]. HIV testing, counseling and treatment are offered at no cost to the residents in the WI. Most of the HIV/AIDS response programs are funded through PEPFAR, which provides 57% of HIV funding in the Caribbean [18]. In 2017, PEPFAR announced the reduction of funding for HIV programs in the larger Caribbean islands [8]. The WI and other members of Organization of Eastern Caribbean States (OECS) have retained their funding but are also vulnerable to the reduction of HIV financing by external donors [6, 8] which can have a negative impact on achieving the SDG goals for health and wellbeing. With increased financial input (both local and international) greater success can be achieved in the fight against HIV and AIDS and other communicable diseases in small island states. Additionally, compliance with ART treatment has been a long-standing problem in the Caribbean (including the Windward Islands), this needs to be addressed urgently to boost the fight against HIV/AIDS [18].

CONCLUSION

This study highlights the situation with communicable diseases in the WI. Lessons can be learned from the achievements of the WI in controlling and eliminating vaccine-preventable infectious diseases like measles, polio, diphtheria and pertussis through consistently high levels of population vaccination coverage, starting in infancy. These achievements prove it is possible for low and middle-income countries to control/eliminate other communicable diseases using cost-effective sustainable strategies. The increase in vector-borne diseases like Dengue, evident in the Windward Islands is a reflection of failed vector control programs within the Caribbean region and globally. Also, the effects of globalization, like increased international trade and travel, urbanization and climate change have enhanced the proliferation and geographical reach of vectors like *Aedes aegypti* mosquitoes. Additionally, although HIV infection and mortality rates have decreased in the Windwards Islands due to improved HIV prevention and treatment programs, vulnerability to loss of funding from international agencies threatens to hinder this progress. This highlights the need for low and middle-income countries to invest their own resources in HIV and other communicable disease prevention programs to ensure sustainability. Stakeholders at multiple levels must be involved in public health action to achieve better health outcomes, including government and non-governmental organizations, civil society, community-based organizations and business organizations.

Finally, there is a need to also improve surveillance and reporting at local and regional levels to increase access to current data and evidence to support policy development and appropriate responses. There were gaps in PAHO's data for several years, highlighting data collection and reporting may not be done on a consistent basis in the WI. This paucity in data creates a limitation for PAHO, the region's health authority, to make evidence-based decisions and to be guided by the principles of health equity in its programs. Governments must improve and monitor institutional structures to improve the performance of the health sector within the local and regional contexts [18].

ACKNOWLEDGMENTS

The authors wish to thank the staff at the Ministry of Health in Grenada and the faculty in the Department of Public Health and Preventive Medicine at St. George's University for their guidance and support for this study. Chapter 72

MEASLES OUTBREAK 2019: RE-EMERGENCE IN THE UNITED STATES

***James Jeongsub Lee*, MD, Prakash Ramdass, MD, MPH
and Angela Gomez, PhD***

Department of Public Health and Preventive Medicine,
St. George's University School of Medicine, St. George's, Grenada

ABSTRACT

The measles outbreaks have been occurring in multiple areas in the United States. The number of confirmed measles cases for the first half of 2019 has already recorded the highest in the last twenty years since the government had declared its elimination in 2000. Measles is a highly contagious disease that is responsible for millions of deaths in the past; however, it is almost completely preventable with vaccination nowadays. Maintaining herd immunity in the population is crucial. The declining rates of vaccination in certain communities or groups of people have led to a sharp spike of measles cases in a short period of time. Methods: Epidemiological data for recent measles outbreaks were collected from CDC and corresponding local health departments to examine the facts about recent outbreaks and their reasons. Results: Data have shown that the vast majority of measles cases occurred in younger children whose parents chose not to vaccinate them. The local health authorities have been putting efforts to stop the chains of infections by ordering mandatory vaccination and eliminating non-medical exemptions based on religious or personal beliefs. Conclusion: The skepticism around autism spectrum disorder and the MMR vaccine still persists among those who are reluctant to get vaccinated despite numerous scientific research studies proving the safety of vaccines. The effects of current interventions are yet to be visualized but it would require concurrent education and health policy adaptation to sway the social norms and make changes in people who are not adhering to vaccination requirements.

INTRODUCTION

The fear of measles is sweeping again among young children and parents in multiple geographic locations in the United States. The United States government had declared the elimination of endemic measles two decades ago in 2000 [1]. This means measles is no longer circulating among the population, or more specifically, the absence of sustained transmission of the virus for more than 12 months. However, sporadic outbreaks continue since there are introduced cases from abroad by international travelers that have spread the virus locally to susceptible individuals. The problem is that the number of measles outbreaks and the number of confirmed disease cases have dramatically increased since 2018. As of July 25, 2019, the Centers for Disease Control and Prevention (CDC) had reported 1,164 cases of measles since the beginning of 2019 [1]. This is the largest number of cases reported in the United States in the past two decades. In April 2019, New York City declared a public health emergency because of a massive spike in measles cases, especially in areas of Brooklyn [2].

Measles was once considered as one of the deadliest infectious diseases because it is highly contagious and it has been responsible for millions of deaths in human history. Most people who contract the disease will fully recover, but a portion of infected individuals will develop some complications including pneumonia, which is the most common cause of measles-related deaths in children, laryngotracheobronchitis, otitis media, and potentially fatal viral encephalitis. The development of the measles vaccine has dramatically changed the disease transmission and mortality rates. Measles, being a viral disease, requires a new host to sustain. However, with effective vaccination, the number of susceptible hosts will be reduced, which will prevent the virus from replicating, causing it to eventually vanish from the population.

One clear reason why the disease might be re-emerging in the United States is because there is an increasing number of unvaccinated children. Laws governing vaccination requirements and exemptions are currently at the center stage of debate regarding whether implementing laws to mandate vaccination or allowing exemptions would impact positively or negatively on public health outcomes.

The purpose of this narrative review is to examine the current measles outbreaks and illustrate some of the existing laws and policies that are in effect to prevent the spread of measles.

METHODS

Epidemiological data for the 2019 measles outbreaks were collected from the CDC website and corresponding local health authorities: Clark County Public Health, NYC Department of Health, California Department of Public Health, and Rockland County Department of Health. These data are publicly available online and the most up-to-date information was obtained as of July 29, 2019. The numbers for reported measles cases per year in the United States from 1994 to 2019 were collected for comparison. The yearly data prior to 2010 were obtained from Morbidity and Mortality Weekly Report, Summary of Notifiable Diseases, published in 2009 as this information is not available on the CDC website. Yearly cases prior to 1994 were not considered for comparison in this review.

because the number of measles cases prior to the introduction of the second dose of MMR (measles, mumps, and rubella) is ranged in several thousand per year and the difference is obvious.

The most recent and current measles outbreak cases occurred in four geographic locations (Clark County, WA; New York City, NY; California State; Rockland County, NY). The data were categorized by age groups and vaccination status. Age ranges were constructed differently per outbreak location as the original source from local public health authorities used different age categorization. In places where the original data are not reported in number of cases, age groups and vaccination status were compared as percentages.

FINDINGS

CDC reports that there are five jurisdictions in the United States with currently ongoing measles outbreaks and there have been 1,164 confirmed measles cases since the beginning of 2019 in 30 states as of July 25, 2019 [1]. As shown in Figure 1, the number of measles cases in this year is significantly greater than any other years since the declaration of the elimination of measles in 2000. The numbers of yearly cases have been kept near the one hundred range since 1997, when the two-dose MMR recommendation had stabilized measles outbreaks across the country; the second dose of MMR was first introduced in 1989. The only exception is the year 2014 in which there were 667 reported measles cases. This was as a result of an outbreak in Amish communities in Ohio, which was responsible for more than half of the total cases in that year [1]. The vaccination rates in these communities at the time were found to be very low due to personal and cultural beliefs. There was also a large measles outbreak in California that started in December 2014, which was associated with an initial exposure at Disneyland theme park, resulting 147 cases between December 2014 and April 2015 [1]. A modest increase in measles cases is observed in 2018 and it is worth noting that some of 2018 outbreaks have continued into 2019. For example, Rockland County and NYC outbreaks, which are believed to originate from a suspected international traveler case in September 2018, have continuously contributed new cases in 2019, representing the degree of severity of disease transmission in these regions.

Sourced from CDC data) [1] [22].

Figure 1. Reported measles cases per year in the United States, 1994-2019.

Table 1. Age groups and vaccination status of confirmed measles cases in Clark County, WA during 2019 outbreak (Sourced from Clark Country Public Health) [3]

Ages	Cases	Vaccination Status	Cases
Under 1 year old	0	0 MMR doses	61
1~10 years old	52	1 MMR dose	3
11~18 years old	14	2 MMR doses	0
19+	5	Unknown	7
Total	71	Total	71

There is a total of 71 confirmed cases in Clark County as a result of the outbreak [3]. As shown in Table 1, 61 out of 71 cases occurred in individuals who previously did not have any MMR vaccine. The cases in terms of age group were as follows: 52 in the 1-10 years old, 14 in the 11-18 years old and 5 in the 19 years and older. The local health authority of Clark County declared that the outbreak was over as of April 2019 with no further cases being reported, however, there are a few other regions in Washington State with ongoing incident cases [3].

The outbreak in New York City is currently ongoing with new cases emerging. There have been 642 confirmed cases as of July 29, 2019 (see Table 2), which date back to September 2018 [2]. Of these cases, 466 out of 642 occurred in unvaccinated individuals, 46 in individuals with one MMR, 31 in individuals with two MMR, and 99 in individuals with an unknown vaccination status. More than three quarters of the cases occurred in the pediatric population and 129 cases were in adults. The NYC outbreak is heavily concentrated in certain neighborhoods in Brooklyn. Of all 642 NYC cases, Borough Park had 122 cases and Williamsburg had 461 cases. All other neighborhoods in Brooklyn and the other 4 boroughs have confirmed measles cases mostly ranging from 0 to 5.

Table 2. Age groups and vaccination status of confirmed measles cases in New York City during 2018-2019 outbreaks (Sourced from NYC Department of Health) [2]

Ages	Unvaccinated	1 MMR	2 MMR	Unknown	Total
Under 1 year	98	2	None	None	100
1 to 4 years	241	33	1	None	275
5 to 17 years	122	4	10	2	138
18+ years	5	7	20	97	129
Total	466	46	31	99	642

In California State, there have been a total of 64 confirmed measles cases statewide with several different outbreak origins [4]. The vaccination status was known in 69% of the total cases reported while in the remaining 31% of the cases the vaccination status was unknown. In the cases with a known vaccination history, 100% of pediatric cases and 48% of adult cases occurred in unvaccinated individuals; while 44% of adult cases occurred in individuals with two or more MMR doses and 7% with one MMR dose (see Table 3).

The current outbreak in Rockland County had a total 289 confirmed cases as of July 30, 2019. The case count started during September 2018 when the first suspected international traveler case was identified [5]. Of the total cases, 78.2% of the confirmed cases had no previous MMR vaccination, 5.9% had 1 dose of MMR, 3.5% had 2 or more MMR doses, and 12.5% had an unknown vaccination history (see Table 4). Among cases, 12.1% belonged to

the age group of under 1 year old, 40.5% were 1-6 years old, 26.3% were 7-18 years old, and 21.1% were over 19 years of age.

Table 3. Known vaccination status of confirmed measles cases in California State during 2019 outbreaks (California Department of Public Health) [4]

Vaccination Status	Pediatric Cases	%	Vaccination Status	Adult Cases	%
Unvaccinated	12	100%	Unvaccinated	13	48%
1 dose	-	-	1 dose	2	7%
2 doses	-	-	2 doses	12	44%
Total	12	100%	Total	27	100%

Table 4. Age groups and vaccination status of confirmed measles cases in Rockland County, NY during 2018-2019 outbreaks (Rockland County Department of Health) [5]

Ages	Cases %	Vaccination Status	Cases %
Under 1 year old	12.1%	0 doses	78.2%
1~6 years old	40.5%	1 dose	5.9%
7~18 years old	26.3%	2 or more doses	3.5%
19+	21.1%	Unknown	12.5%
Total	100%	Total	100%

DISCUSSION

The number of measles cases in 2019 thus far is the reason for concern. It has already surpassed the number of cases in 1994, a long time before the declaration of the elimination of measles in the United States. The number of incident cases is on a trajectory to increase even further by the end of the year. In addition, the current outbreak trend suggests that there are areas with high vulnerability to the measles infection. There are multiple foci of local communities with highly concentrated measles cases when compared to the rest of the United States. These foci also recorded low vaccination rates in their communities. Data from four different geographic locations concordantly showed that the vast majority of confirmed measles cases in these outbreaks are clustered among younger children who did not receive any MMR vaccine. This highlights the importance of the preventive effectiveness of vaccination against measles.

However, a contrasting scenario was shown in California where a large proportion of adults who had measles were previously vaccinated with two doses of MMR. This is most likely attributed to the waning effect of vaccine-induced immunity [6]. Although two doses of MMR vaccine during childhood usually provide sufficient protection until adulthood, waning of immunity differs from person to person and the antibody titer could shrink below sufficient level within several years [7]. In such cases, the serum antibody titer would provide sufficient evidence of current immunity against measles. Alternatively, these adult cases of measles may have been as a result of immunodeficiency, either from immune function related diseases or from the effects of immunosuppressive medications used for other diseases. Nevertheless, the majority of the measles infections to this date have occurred among unvaccinated young children.

Measles and Vaccinations

Due to the nature of its mode of transmission by air and by contact with body fluids, measles is highly contagious and it spreads rapidly to susceptible individuals. It's severity of contagiousness is marked by the fact that 9 out of 10 people who come into contact with an infected person would also become infected, if they were not already immunized. Because of this high transmissibility the disease was responsible for the loss of millions of human-lives worldwide prior to the development of the measles vaccine. At a population level, it is crucial to achieve the herd immunity threshold. The herd immunity threshold for measles is known to be about 93~95%. The estimated MMR vaccination coverage among children aged 19–35 months in the United States is 91.5% for 2017 [8]. This number seems reasonably high but the problem is that there are pockets of geographic areas in the vaccination map where the community vaccination rate is far below 80%. Rockland County had only 72.9% of people in the ages of 1-18 years vaccinated with two doses of MMR despite the effort from the local health authority [9]. Clark County estimated overall measles vaccination rate of 78%, which is also too low for herd immunity [10].

It is practically impossible to have everyone vaccinated in any given population because there are always individuals who may elect not to get immunized, nor to have their children vaccinated. There are also individuals who have contraindications to the MMR vaccine. MMR is a live attenuated vaccine and people with immunocompromised state or pregnant women should not get the vaccine due to the risk of a full-blown infection. Another consideration is for children under the age of 1 year. According to the CDC immunization schedule, the first dose of MMR vaccine is generally administered between 12 to 15 months of age and the second between 4 to 6 years of age [11]. MMR vaccine is typically not given before 12 months of age because young children do not respond adequately to the vaccine. Special consideration could be applied if the child has to travel to an endemic region in which case the vaccine may be given as early as 6 months of age, but still have to follow up with regular two doses afterwards. Systematically, this schedule leaves out children under the age of 1 year relatively unprotected even with the consideration of passive immunity transferred from mother, which would mostly disappear several months after being born. This is another reason the herd immunity is so important in order to maintain a population-level protection against measles. These individuals, who cannot achieve their own immunity through the MMR vaccine due to the aforementioned reasons, can passively avoid the infection if the herd immunity remains strong.

While the reasons for the low vaccination rate may vary between these measles “hotspot” communities, it is clear that a low vaccination rate is strongly correlated with the number of measles cases. There has been a big spike of measles occurrences in these communities when there is an introduction of measles from travelers and, also, the disease spreads very quickly. In the end, the victims of low vaccination rates are the young children who cannot express their opinions since the decisions were made for them by their parents.

The MMR Myth

One of the reasons for the anti-MMR movement stems from data purporting an association of MMR vaccine and autism. A former British physician, Andrew Wakefield, published a research paper in *The Lancet* claiming there is an association between the MMR vaccine and colitis and autism spectrum disorder [12]. This MMR vaccine controversy was proved to be fraudulent due to the manipulation of the research evidence and the presence of multiple undeclared conflicts of interest. However, the fear about the possibility of their children developing autism spectrum disorder still persist among some parents in spite of numbers of scientific studies refuting such associations and the fact that the original paper was retracted from *The Lancet* [13]. The original claim by Wakefield gained such a massive media attention at the time that it engraved anti-vaccination in a lot of people's minds distracting their focus from the scientific evidence. There is still much more advocacy that individual healthcare providers need to take part in to increase MMR vaccination rates.

Non-Medical Exemptions (NMEs)

Most states require children to have appropriate vaccination prior to entering kindergarten or grade school. But the parents may ask for non-medical exemptions based on their religions or personal beliefs although not all states allow such exemptions. Olive et al. [14] revealed in their study that the number of NMEs has risen since 2009 in 12 of the 18 states that allow this policy and they also identified that there is an inverse relationship between NME rates and MMR vaccination rates in these states. Suffice it to say, communities with higher NME rates have a larger portion of vulnerable pediatric population against vaccine preventable diseases such as measles and these communities correlate with several measles outbreak locations during 2018-2019. On the contrary, the same study also concluded that the states which have banned NMEs exhibited higher MMR vaccination coverages among kindergarten children [14].

One aspect of non-medical exemption concerns the religious or personal beliefs. The outbreaks in New York City and in Rockland County seem confined to Orthodox Jewish residents who have chosen not to vaccinate their children for the religious beliefs. In some neighborhoods, the belief that the supernatural is in control of illness rather than a vaccine, have contributed to low vaccination rates [15]. This brings an ethical dilemma about the freedom of religious belief and the freedom to choose not to vaccinate. There may not be one true answer to this situation but the outbreak would only grow larger if no changes are made.

California SB277 – Elimination of NMEs

California was the first state to step forward to address the non-medical exemption issue. After the outbreak occurred between December 2014 and April 2015, which was originated from an initial exposure at Disneyland theme park and resulted 147 measles cases mostly in unvaccinated younger children, California implemented Senate Bill 277 (SB277) in June 2015, which eliminated non-medical exemptions from childhood immunization requirements

and it also encompassed the removal of religious objections [16]. This bill mandated all children to meet the vaccination requirements for entry to grade schools as well as day care centers in California unless they are exempted by medical reasons. Despite the challenges of implementing the law, this change in health policy resulted in modest success. Delamater et al. [17] revealed that the percentage of kindergartners entering school while not up-to-date on vaccinations decreased from 7.15% to 4.42%. However, Delamater et al. [17] has also stated that the previous geographic patterns of vaccine refusal persisted after the law's implementation.

Rockland County, NY – Barring Unvaccinated from Public Space

In Rockland County, measles outbreak had occurred since September 2018 and there have been continuous occurrences of new confirmed cases until this date. The county declared public health crisis in March 2019 and barred unvaccinated children from public places where more than 10 persons are intended to congregate [18]. The ban was soon put on hold several days later by a state judge in response to lawsuits filed by the parents of local school children. The judge concluded that the current outbreak didn't meet the definition of an epidemic that the law permitting emergency declarations requires [19]. Despite multiple efforts from the local health authority to encourage MMR vaccination through campaigns and free vaccination clinics, the vaccination rates linger in 70's in particular communities and the health officers are concerned as more occurrences are expected.

New York City – Mandatory Measles Vaccination

On April 9, 2019 New York City declared a public health emergency over the measles outbreak and the health commissioner ordered mandatory vaccinations for anyone in the neighborhood with certain zip codes including people with religious objections and children between 6 to 12 months of age [2]. People who ignored the order could be fined \$1,000 if found out, even retrospectively [20].

This is certainly a more stringent version of the prevention efforts. While it is very clear that the city wants to put a stop to the spread of measles in its jurisdiction, there are also voices criticizing the mandatory vaccination order. Cantor [21] wrote in the *New England Journal of Medicine* that forcible vaccination should represent an unconstitutional intrusion on the liberty of competent adults. Yet the legal justification is far more complex because the constitutional law clearly states that the state governments may require individual liberty to yield to reasonable public health regulation [21]. The degree of reasonable interventions may be interpreted differently depending on the person and situation. Cantor [21] also stated that the force, whether economic or physical, does not educate, develop trust, or protect human dignity. This implies that the order may work as a solution for a temporary measure but would not help change the public awareness regarding vaccination. In June 2019, New York State signed legislation which removed nonmedical exemptions from school vaccination requirements. Under the legislation, New York City health officials then enforced closure of schools in the city that failed to comply with the measles-related emergency order. The long-

term effects of current interventions are yet to be found out. Nonetheless, the explosive public attention gained for the current measles outbreaks definitely provides an ideal opportunity to educate everyone about the importance of vaccination.

CONCLUSION

The United States is currently experiencing the worst measles outbreak in the past twenty years stemming from low vaccination rates in certain communities and groups of people. The current trend with rapidly increasing number of new cases is certainly alarming. It would be prudent to take preventive countermeasures before the disease starts to spread out of control. The reasons for people refusing vaccination are all too well known: fears of adverse effects of the vaccine, religious and personal beliefs. Despite numerous scientific literature claiming no association between MMR vaccine and developmental disorder, obstinate skepticism persists and the anti-vaccination is still being propagated within the population. In the case of MMR vaccination, education and litigation methods have to be applied concurrently because either one would not succeed on its own.

MMR vaccine has been shown to be highly effective and safe. The government has to become more proactive in educating the public with specific and correct information; reasons why we need measles vaccine, scientific evidence demonstrating the safety of vaccine, and false rumors circulating around the vaccination. Primary healthcare providers are likely an underused resource in conveying accurate information and advice on vaccination to the public. Advancing by a small step where the changes could be widely accepted is the key to the successful transformation. For example, instead of eliminating non-medical exemptions altogether there should be step-wise procedures implemented to the non-medical exemption process such as first having mandatory consultation with health professionals to exchange their views about vaccination in order to proceed further. If the reason not to vaccinate their children have arisen from religious or cultural beliefs, these need to be properly addressed in order to prevent negative stigmatization of the particular groups. In the end, the public awareness has to be improved so that people acknowledge that vaccination is a societal responsibility; it is a form of altruistic behavior. Maintaining the herd immunity is essential for protecting our communities, the immunocompromised, pregnant women, and most importantly young children who are yet to get vaccination.

Chapter 73

VACCINE AWARENESS FOR CERVICAL CANCER

***Sadik Uddin, MPH, Avi Bahadoor-Yetman, MSc
and Emmanuel Keku*, MD, MA, MSPH***

Department of Public Health and Preventive Medicine,
St. George's University School of Medicine, St. George's, Grenada

ABSTRACT

Cervical cancer, caused by the human papillomavirus (HPV) is the third most prevalent cancer in women, globally. Worldwide application of the HPV vaccine varies, ranging from thorough administration of immunizations in the first world to practically nonexistent in various developing countries. We survey the state of HPV vaccine awareness and cervical cancer mitigation worldwide and propose a framework for improving education on the vaccine's benefits and implementation of vaccination programs in the developing world. We also discuss how health care professionals can communicate with parents and policy makers to ensure that this framework is sustainable.

INTRODUCTION

The HPV is a double-stranded DNA virus that produces pathological effects on epithelial cells. This virus is a sexually transmitted infection (STI), spread through direct skin to skin contact [1]. The greater percentage of sexually active adults will be infected with HPV at least once in their lives, with the highest rates of infection occurring with women younger than 25 [2]. HPV is the most common STI because of its high transmissibility [3].

There are 100 different strains of HPV, some of which cause active disease, though most are cleared by the immune system. HPV can progress to different pathological presentations such as head and neck cancers and anogenital cancer including: vulval, vaginal, anal and penile. The most common result of HPV infection is progression to cervical cancer and/or genital warts. About 4% of all cancers are related to HPV [4]. The high-risk oncogenic types

* Corresponding Author's Email: ekeku@sgu.edu.

of HPV, HPV 16 and HPV 18, are associated with 99.7% of cervical cancer cases [1]. The carcinogenicity of these types of HPV is due to the activity of oncoproteins E6 and E7, which impair the growth regulatory pathways leading to the slow accumulation of host genetic mutations [5].

The third most common cancer in women worldwide, often affecting women under 40 years, is cervical cancer [6]. Cervical cancer robs women of many productive years and requires resource-intensive treatment. However, this cancer is preventable due to the HPV vaccine. There are two HPV vaccines available: the quadrivalent, which protects against the most common oncogenic strains of HPV, 6, 11, 16 and 18, and the nine valent which protects against five additional oncogenic types 31, 33, 45, 52 and 58 [7]. Studies carried out in the US where HPV vaccines are recommended have shown a reduction in cervical cancer incidence since the implementation of HPV immunization [8]. The HPV vaccine needs to be administered before people become sexually active because of HPV's high transmissibility and prevalence, infection is possible at the first sexual contact [9].

SAFETY OF THE HPV VACCINE

The Advisory Committee on Immunization Practices (ACIP) in 2006 recommended the HPV vaccine for routine vaccination of adolescent girls at age 11 or 12 years, and in 2011 for adolescent boys ages 11 or 12 years [10]. The HPV vaccine can be administered safely with other routinely recommended vaccines at a well-child visit to the physician. A post-licensure safety assessment carried out between 2006 and 2009 shows that there was no statistically significant increased risk for any pre-specified adverse events after vaccination such as Guillain-Barre, stroke, allergic reactions, and anaphylaxis [11]. Randomized controlled clinical trials of the HPV vaccine provide evidence of an excellent safety profile; the vaccine continues to be well-tolerated and immunogenic up to 9 years following vaccination [12]. The HPV vaccine, like all vaccines recommended by the WHO, had to go through multiple safety trials and its efficacy supported by scientific data, before it was deemed safe and an internationally recommended vaccine.

EFFICACY OF THE HPV VACCINE

The efficacy of the HPV vaccine for protecting against cervical cancer is widely accepted. The quadrivalent HPV vaccine, which is more widely used, protects against 70% of all cervical cancer. The nine valent vaccine increases this protection to about 90% of cervical cancer [7]. Ten years post vaccination the HPV 16/18 vaccine demonstrates continued efficacy against cervical intraepithelial neoplasia irrespective of HPV type [13]. The HPV vaccine protects not only against cervical cancer but other HPV related pathologies.

The HPV vaccine was initially only administered to young women to protect against cervical cancer; however, the administration was expanded to young men to protect against anogenital cancers and genital warts caused by HPV. In males who are 16 to 26 years old, the quadrivalent HPV vaccine prevents infection with HPV and the development of genital lesions such as warts and anogenital cancers [14]. Vaccinating both males and females

facilitates herd immunity. The efficacy of widespread HPV vaccination of both males and females has been proven. However, the WHO does not recommend the vaccine to males because the disease burden of HPV on men is not as great as on females [15].

WHO RECOMMENDATIONS

According to the WHO [15], 90% of deaths from cervical cancer globally occur in low- and middle-income countries. The HPV vaccine can significantly decrease the number of deaths as a result of cervical cancer. Developing countries contribute the most to cervical cancer deaths because there is limited access to the HPV vaccine for primary prevention, the pap smear screening test for secondary prevention and treatment of cervical cancer.

All girls between the ages of 9-14 years should be given the HPV vaccine as part of routine vaccination, before they start sexual activity [15]. This is seen as a form of primary prevention to protect against HPV. The aim is to proactively block infection; secondary prevention such as pap smear screening is still necessary but with the widespread use of the HPV vaccine, fewer people will require tertiary prevention. The WHO recommends vaccinating girls and not boys, though HPV prevents genital warts and anogenital cancers in males, as this is the most cost-effective measure against cervical cancer [15]. Implementing vaccinations in girls has been proven to be cost-effective, but there has not been enough research to support the recommendation to vaccinate boys in resource-poor countries. It is likely that as more research and evidence on the safety, efficacy and cost-effectiveness of HPV vaccine in males becomes available a recommendation for vaccinating both girls and boys may be made.

BARRIERS TO SUCCESS OF WIDESPREAD VACCINATION

There are many barriers to successfully implementing widespread vaccination. One of the major impediments in developed countries, where the vaccine is readily available, is lack of healthcare provider recommendation [16]. Parents willingness to vaccinate their children is higher when physicians recommend the vaccine. This vaccine is recommended for females aged 9-14 years old so parental consent is required to administer the vaccine. In countries where the HPV vaccine is readily available, healthcare providers have found that parental resistance is often the reason for the low rates of the HPV vaccine uptake [17]. Potential barriers to parents consenting to the HPV vaccine include concerns about the effects of the vaccine on sexual behavior, low perceived risk of HPV infection, vaccine costs, social influences and irregular preventative care [18].

Anti-vaccination campaigns have threatened existing HPV vaccination programs in many countries [19]. The spread of false information on the HPV vaccine and its efficacy and safety has hindered the US from reaching its 80% vaccine coverage target for 2020 [16].

The cost of the cervical cancer vaccine is a barrier to its widespread adoption in the developing world. The three-dose series of the quadrivalent vaccine costs approximately \$360 USD [20]. Despite the vaccine's cost in the developing world, from 2013, Gavi, the Vaccine

Alliance has negotiated lower prices for eligible low-income countries [21]. Policy makers in developing countries and Gavi need to work together to source subsidized HPV vaccines.

COUNTRIES WITH HPV VACCINE IMPLEMENTATION

Australia implemented a government funded school-based HPV vaccination program in 2007 for females aged 12-13 years and a catch-up program in 2009 for young females 13-26 years [22]. The school-based program is key as it removes the barrier of parents having to take children to the doctor for immunization. There has been a significant reduction in the incidence of genital warts among vaccine eligible females since the initiation of the vaccination program [23]. Herd immunity is also present because there was a reduction of 44% of new cases of genital warts in young males who are not part of the program, documented in the same time period [22].

Likewise, the US has implemented widespread HPV vaccination with the aims of having 80% vaccine coverage for females aged 13-15 years by 2020 [24]. HPV vaccine coverage among US females has increased since vaccine licensure but it remains low compared with other recommended adolescent vaccines [18]. Parents often consent for the other adolescent vaccines but not HPV as there is often lack of education on the benefits of the HPV vaccine.

Also, studies carried out in the US have demonstrated a reduction in cervical cancer incidence since the implementation of HPV immunization [8]. Furthermore, a cost-benefit analysis performed in the US demonstrated that vaccinating girls between 9 and 14 was cost effective when compared to current practice, US \$14,538 per quality-adjusted life year (QALY) gained [25]. There have been clear benefits to the implementation of an HPV vaccination program in the US. However, it is concerning that the vaccine coverage is falling below the target.

In Israel during the school years 2015-2016 through 2018-2019 the Gardasil-4 vaccine was administered to girls and boys in the eighth grade at school. During the school year 2014-2015, the Gardasil-4 vaccine was administered to eighth grade girls in schools and during the school year 2013-2014, the Cervarix vaccine was administered to eighth grade girls at school and to ninth grade girls at the health bureaus. As of the 2019-2020 school year the Gardasil-9 vaccine will be provided to girls and boys in the eighth grade at school. Two doses six months apart will be administered.

SUSTAINING VACCINATION

The priority of all healthcare providers who work with adolescents should be to increase the rates of HPV vaccination. In countries where the HPV vaccine is readily available providers need to recommend it like they would other scheduled vaccines and collaborate with parents to ensure maintenance of the vaccine schedule [24]. Widespread HPV vaccination requires not only healthcare provider support but government policies and mandates to improve coverage and unhindered access to the HPV vaccine [26]. Health education and health promotion programs to raise awareness on HPV, its related pathologies and the HPV vaccine, are essential to sustaining vaccination rates [27]. Policy makers need to

recognize that parents, the key decision makers for consent of this vaccine, are hesitant in complying with vaccine administration; strategies to educate parents and ensure optimal vaccine uptake are required [28]. It will be a waste of resources to make the vaccine readily available and it is not utilized.

Moreover, the decisions made to implement widespread HPV vaccination should be financially sustainable. Healthcare systems must ensure that vaccine purchasing mechanisms prioritize cost-saving interventions, have support to confront challenges in procuring vaccines, and use accurate vaccine demand forecasting [29]. Gavi, the Vaccine Alliance, helps low-income countries source funding for HPV vaccination programs and helps facilitate a vaccine demonstration program to help countries make informed decisions for subsequent national introduction of the vaccine [30]. Countries can use vaccine demonstration programs to help them map out the wider implementation plan and make it more effective.

DISCUSSION

There needs to be a framework in both developing and developed countries for broadening the application of the HPV vaccine for the prevention of cervical cancer and related illnesses. The cost-effectiveness of the vaccine has proven its necessity. The widespread implementation of this vaccine will require greater awareness and a community-based effort to vaccinate.

A large proportion of general population is unaware of HPV and its impact. In countries where the HPV vaccine is readily available, parents tend to deny consent because they have not been educated on the vaccine. Education campaigns targeting policy makers, healthcare practitioners and parents have shown an increase in compliance with the HPV vaccine [27]. Parents who are assured of the efficacy and safety of the vaccine are more likely to allow vaccination of their children. Targeted education campaigns are necessary to facilitate the implementation of an HPV vaccine program.

Similarly, the effort to vaccinate should be community-based, carried out by healthcare community workers to educate the parents so they will consent to vaccination. Community health workers are more trusted and are better able to communicate with community members. They better understand the culture and may be more successful at educating parents on HPV. Additionally, administering the vaccines in schools, to relieve parents of the responsibility of taking their child to the doctor, is another promising measure. Many countries have school vaccination programs, adding the HPV vaccine to the vaccination schedule increases compliance. The HPV vaccine has two or three doses and school vaccination programs are a more efficient way to stay on the vaccination schedule. Community healthcare workers can also be used to remind parents to comply with the vaccination schedule. Likewise, the children receiving the vaccine should also be educated on the benefits as part of a wider conversation on sexual health.

Furthermore, countries annually spend an exorbitant amount on the treatment of cervical cancer and related conditions. In the US the annual average cost of treating one patient <65 years old with cervical cancer in the last year of life is US \$117,830 [31]. The three-dose series of the quadrivalent vaccine costs approximately \$360 USD [20]. Modeling studies have demonstrated that HPV vaccination can be cost-effective [32]. The decrease in the resource

burden of cervical cancer and other HPV related pathologies on health systems is reason enough to implement HPV vaccination.

Resources are not only spent on the treatment of cervical cancer; in the event of an abnormal pap smear, the procedures carried out following can be costly. These procedures may show results that do not indicate a precancerous or cancerous state, however, the changes in the cervix are due to HPV. The HPV vaccine prevents these abnormal changes, which would result in costly medical procedures.

Moreover, the disease burden of cervical cancer is great, particularly in resource-poor countries. Often, by the time patients present with symptoms of cervical cancer, treatment is costly. The treatment of pre-cancer lesions on the cervix, cryotherapy, is resource intensive. Primary prevention of cervical cancer, HPV vaccine, prevents infection and therefore progression to a precancer or cancer state. Developing countries will be less burdened by cervical cancer if they implement HPV vaccination programs. Gavi, the vaccine alliance, facilitated programs will help low income countries with widespread implementation of HPV vaccination.

In addition, cervical cancer affects women who are still productive and are likely part of the workforce. In the US in 2014 \$2.1 billion was the total productivity loss due to cervical cancer [33]. Not only is the cost of diagnosing and treating cervical cancer great, there is a significant loss in productivity. A loss that would likely be decreased if women from that generation had been vaccinated against HPV.

It is important that low- and middle-income countries develop HPV vaccine programs speedily because delays mean another group of females miss the window to be vaccinated. The vaccine's implementation in these nations is imperative, as every five-year delay in roll-out contributes to 2 million cervical cancer deaths [34]. These deaths are avoidable, and a concerted effort needs to be made to effect policy changes that will lead to widespread HPV vaccination.

CONCLUSION

Cervical cancer is one of the few cancers that its etiology is well-understood and a reliable prevention tool developed. The safety and efficacy of the HPV vaccine has been proven and supported by scientific data; however, widespread vaccination is not a reality globally. The cost-benefit analysis of HPV vaccination programs has proven the programs cost effective. These vaccination programs help relieve the financial burden of HPV on health systems. Despite tremendous advances made towards implementing the HPV vaccination programs, throughout the world, developing countries still lag in this regard. Several developed countries, which have the vaccine readily available, also fall short of vaccination coverage goals. Initiatives to design and establish a comprehensive vaccination framework in these countries could be tremendously beneficial, especially those heavily focused on educating the patients and their communities on the risks of cervical cancer, and necessity of implementing proactive measures against it. This is a preventable cancer that should be eradicated.

Chapter 74

**EFFICACY OF COMBINATION ANTIMICROBIAL
THERAPY AND IMPACT ON EMERGING
ANTIMICROBIAL RESISTANCE:
A TWENTY-FIVE YEAR SYSTEMATIC REVIEW**

ABSTRACT

Antimicrobial resistance is a growing threat to public health. We quantified concerning trends in the development of antibiotic resistance across multiple species against a variety of antibiotics from 1996-2015. The systemic increase in the percentage of antimicrobial resistance demonstrated a decline in the percentage of the population that was susceptible. An emerging strategy to combat these trends is to use combination antimicrobial therapy in order to shift population percentages to favor the growth of susceptible strains. In order to support the viability of this strategy, we performed a systematic review of the literature to evaluate the evidence for combination therapy significantly affecting the relative population of susceptible versus resistant strains of microorganisms in vivo. In six of the eleven studies, we found a significant association between efficacy in drug combinations and a population shift towards the drug resistant strain for the microorganism of interest.

INTRODUCTION

The CDC (Center for Disease Control and Prevention) estimates antibiotic resistant strains account for more than two million infections and 23,000 deaths each year [1]. From 1997 to 2006, hospitalizations related to antibiotic resistant infections each year increased by 359% [2]. The increased antibiotic resistant infection proportion is believed to be associated with increased consumption of antibiotics. Antimicrobial resistance can occur via specific mechanisms of resistance transfer that include conjugation, transduction, and transformation [3].

Table 1. The CDC classification of significant antibiotic resistant threats [1]

Hazard Level	Antibiotic Resistant Microorganisms
Urgent	<i>Clostridium difficile</i> (<i>C. difficile</i>) Carbapenem-resistant <i>Enterobacteriaceae</i> (CRE) Drug-resistant <i>Neisseria gonorrhoeae</i> (cephalosporin resistance)
Serious	Multidrug-resistant <i>Acinetobacter</i> Drug-resistant <i>Campylobacter</i> Fluconazole-resistant <i>Candida</i> (a fungus) Extended spectrum β -lactamase producing <i>Enterobacteriaceae</i> (ESBLs) Vancomycin-resistant <i>Enterococcus</i> (VRE) Multidrug-resistant <i>Pseudomonas aeruginosa</i> Drug-resistant Non-typhoidal <i>Salmonella</i> Drug-resistant <i>Salmonella typhi</i> Drug-resistant <i>Shigella</i> Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Drug-resistant <i>Streptococcus pneumonia</i> Drug-resistant tuberculosis (MDR and XDR)
Concerning	Vancomycin-resistant <i>Staphylococcus aureus</i> (VRSA) Erythromycin-resistant <i>Streptococcus</i> Group A Clindamycin-resistant <i>Streptococcus</i> Group B

Drug resistance variations between different strains of bacteria and viruses exist and contribute to this resistance. For example, in the human immunodeficiency virus (HIV), the level of resistance to antiretroviral drugs differs amongst different HIV variants. In the treatment of *human immunodeficiency virus* (HIV), the level of resistance to antiretroviral drugs differs amongst different HIV variants [4]. As of 2010, animal antibiotic consumption was estimated to be 63,151 tons with predictions for consumption to increase to 105,596 tons by 2030 [5]. As of 2013, animal antibiotic consumption was 131,109 tons, and new projections for 2030 are 200,235 tons [4]. The use of antibiotics increase significantly every year, and projections are often exceeded. In a study that analyzed *E. coli* from 1998-2007 in the United States, *E. coli* increased in resistance against ampicillin, ciprofloxacin, ampicillin/sulbactam, levofloxacin, and trimethoprim/sulfamethoxazole [5]. The prevalence of *Helicobacter pylori* resistance to clarithromycin (1993-2014), metronidazole (1993-2014), and levofloxacin (1999-2014) has steadily increased over time in many countries [2]. As shown in table 1, the CDC has been tracking and classifying antibiotic resistant organisms to better understand the impact on the healthcare system and identify areas of focus for researchers to address increased resistance to currently available antibiotics [1]. These high

priority microorganisms are showing new resistances in recent years and an increased percentage of the respective populations are showing antimicrobial resistance. This systematic review seeks to quantify the trends in antimicrobial growth and analyze the evidence of population shifts in response antimicrobial combination therapy.

This paper will examine combination antimicrobial therapies with respect to their efficacy and effects on antimicrobial resistance during a 25-year period from 1992-2017.

BRIEF INTRODUCTION TO COMBINATION DRUG THERAPY

Combination drug therapy involves using drugs for the purpose of creating an effect that could not be achieved individually [8]. In order to fully understand combination drug therapy, figure 1 adapted from Pimenta et al. places an emphasis on drug effectiveness and drug interactions, including antagonism, additivity, synergism, inertism, and coalism.

Figure 1. Considerations of drug combination therapy are all considered for the purpose of the efficacy goal.

Both inertism and coalism occurs when a single drug alone has no effect on the pathogen of interest and an additional drug is required for an effect. Synergy is the interaction of drugs to yield a greater combined effect than the sum of their individual effects. Additivity is when the interaction of combined drugs is equal to the sum of their individual effects. Lastly, antagonism interaction of drugs has one drug inhibiting the action of the other.

Drug interactions occur as a result of the characteristics of the drug, the effects of the drug on the body (pharmacokinetics), the way the drug moves through the body (pharmacodynamics), and characteristics of the host itself. Therefore, the same factors are studied to know how efficacious a drug is against a certain microorganism. An emerging understanding of combination therapies suggests that efficacy and resistance are related in shifting the proportion of antibiotic resistant versus antibiotic susceptible populations.

By utilizing an ecological model framework, mental illness can be demonstrated on a multilevel system of mutual interaction and influences that contribute to its perceived worth and importance. In particular, the Social Ecological Model (SEM) of health delves into the intrapersonal (individual belief and cognition), interpersonal (family and peers), organizational (community health centers and medical providers), community (identity factors of ethnicity and culture), and societal levels (policy and government) have been explored to better understand the beliefs and barriers of mental health acceptance and health-seeking behavior within this population. Research has indicated that various interconnected

factors in the mismanagement of refugee mental health continue to occur and a need for targeted interventions must be implemented if optimal mental health outcomes are to be attainable [2].

MIXED EFFICACY OF MONOTHERAPY VERSUS COMBINATION THERAPY

There has been a great deal of controversy about the best treatment options. The results of both in vivo and in vitro investigations are mixed in regards to whether monotherapy or combination therapy is the superior treatment. To illustrate this, a study for each of the urgent hazard level organisms will be discussed: *Clostridium difficile* (*C. difficile*), carbapenem-resistant enterobacteriaceae (CRE), drug-resistant *Neisseria gonorrhoeae* (cephalosporin resistance). In the first meta-analysis, the authors compared the results of metronidazole monotherapy with vancomycin monotherapy and combination therapy in patients infected with *Clostridium difficile* (*C. difficile*) [9]. The results showed an equal efficacy for both drugs individually, but they noted that the combination produced additional side effects without increasing the efficacy synergistically [9]. In another meta-analysis that looked at carbapenem-resistant enterobacteriaceae (CRE), the evidence suggested that use of combination therapy relative to polymyxin monotherapy produced lower 28-day or 30-day mortality [10]. An investigation of drug-resistant *Neisseria gonorrhoeae* (cephalosporin resistance) chose to look at the varying efficacies across different pairs of combination therapy [11]. The results showed varying degrees of efficacy, but those with the highest efficacy were not effective against a certain strain that was affected by the lower efficacy combinations [11]. The best available treatment options in terms of efficacy vary in effect depending on the organism, and even some cases the individual strains will determine the treatments with the highest efficacy.

CONSEQUENCES OF TREATMENT

Since the antibiotics that are used to treat patients provides a competitive advantage for resistant strains, patients who were exposed to antibiotics in general were more likely to be colonized by MRSA in a hospital setting according to a meta-analysis [12]. This occurs primarily by indiscriminately disrupting the normal microflora, which in turns provides more room and resources for colonization by drug resistant bacteria [13]. Although most antimicrobials approved by the FDA are safe and contain minimal side effects, some can have life-threatening side effects [14]. The severity of the side effects is dependent on the patient themselves with factors such as immunodeficiency, age, and comorbidity coming into play [15].

In 2016, the CDC published a study that found the manner of prescribing antibiotics had not changed significantly from 2006-2012. More than 50% of patients staying at a hospital had been prescribed at least one antibiotic during their stay [16]. This led to the implementation of stewardship programs for hospitals [17]. These programs include tracking and reporting the prescription and use of antibiotics. Perhaps the most important involves

educating physicians about the emerging resistance and optimal prescription methods following clinical guidelines provided by the hospitals [17]. The CDC has also implemented the program, Be Antibiotic Aware, that includes evidence-based methods to improve and control for the use of antibiotic therapy given to patients in hospitals, clinics, and private practice settings [18].

OUR SEARCH

An initial search was conducted on September 17, 2018 using Google Scholar to look at trends in antibiotic resistance in the last 25 years. A systematic review using peer reviewed journal articles published on the Internet was performed to analyze trends in antimicrobial resistance. Any publications that were not peer-reviewed publications were thrown out. The search was then narrowed down to include resistance of combinational antibiotic drug therapy use and its efficacy using the PubMed database. MeSH terms for “combinational drug therapy” and “antibiotic resistance” were defined using this database yielding a total of 2029 results. The MeSH terms were further defined to include the following subheadings: adverse effects, analysis, statistics and numerical data, drug chemistry, ethics, etiology, mortality, physiology, therapeutic use, therapy, toxicity, trends, treatment outcome. These subheadings included information pertinent to obtaining peer-reviewed articles that encompassed the efficacy of drug treatment. This refined search resulted in a total of 212 non-duplicated research articles, which were screened using the inclusion/exclusion criteria defined in the sections below. The primary screening included collecting the date of publication, bacterial organism, study design, and sample size of each article. After articles were excluded, the remaining 11 articles were analyzed. Additionally, the results of the systematic review were categorized according to year of publication, organism of interest, and classification of organism in figures 2-4.

Figure 2. This pie chart breaks down the distribution of primary research articles that were focused on the resistance or susceptibility of different microorganisms elicited in the investigation. The other category was comprised of single mentions of microorganisms or neutropenia. The results are shown in both percentages as well as raw numbers.

Figure 3. This pie chart breaks down the distribution of primary research articles that further quantified susceptible and resistant strains in in vivo experiments.

Figure 4. This bar chart breaks down the distribution of primary research articles by quantifying the distribution of the publications analyzed by year of publication.

Inclusion Criteria

The target population of this study included published articles that included both the effect and efficacy of combinational drug therapy on antimicrobial resistance. They were separated by microorganisms and ranked by year of publication. The studies that included similar microorganisms were grouped together and reviewed. Those organisms that had the highest frequency of studies conducted were included in this review. Drug resistance trends that stood out in the screening included the following bacterial organisms: Hepatitis C, MRSA, and *Helicobacter pylori*.

Exclusion Criteria

Case studies, narrative reviews, meta analyses, and opinion pieces were excluded from this review. Articles that included comorbid bacteria resistance seen with a chronic disease were excluded.

Figure 5. This flow chart simplifies the decision process in how the choices currently being made are affecting the future of antimicrobial therapy.

Data Collection and Analysis

The PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) model was used in order to reduce the potential for bias in the study and to standardize the evaluation of the evidence. Data was gathered from the 11 articles. The name of the organism and antimicrobial drugs were collected on a table along with the efficacy and p value.

To further analyze the trends of antimicrobial resistance within the last 25 years, graphs were made summarizing four extensively studied microorganisms affecting humans: *Salmonella*, *Shigella*, *Escherichia coli* and *Campylobacter jejuni*. The information from the four organisms was extracted from the Center for Disease Control and Prevention National Antimicrobial Resistance Monitoring System's database.

FINDINGS

The history of the development of antimicrobial resistance was analyzed from 1996 to 2015 for four bacteria: *Salmonella*, *Shigella*, *Escherichia coli*, and *Campylobacter jejuni*. Four antibiotics were tracked for each bacteria for a total of sixteen trends to be analyzed. The

data was originally collected as part of the National Antimicrobial Resistance Monitoring System published by the CDC. Two important trends appear in each of the four microorganisms analyzed: an antibiotic resistance develops in a bacteria where none had existed before and a substantial increase in resistance is observed across many years for those antibiotics under observation. A gain of new resistance was seen in salmonella for ciprofloxacin, in shigella for cefoxitin, in *Escherichia coli* for nalidixic acid, and in *Campylobacter jejuni* for telithromycin. In 1996, less than one percent of the salmonella population was resistant to nalidixic acid, but by 2015 almost five percent of the population was resistant to nalidixic acid. In 1999, less than sixty percent of shigella was resistant to streptomycin, but by 2015 almost a hundred percent of the reported population was resistant to streptomycin. In 1996, only two percent of the reported *Escherichia coli* was resistant to streptomycin, but by 2015 the percentage had risen to over twelve percent. In 1997 less than twenty percent of the *Campylobacter jejuni* population was resistant to either ciprofloxacin or nalidixic acid, but by 2015 almost thirty percent were resistant to both [16].

Relationship between Resistance and Efficacy

Eleven studies met the inclusion criteria for quantifying the efficacy of combination therapy regimens in vivo in both susceptible and resistant strains in microorganisms. Among these studies, eight studies examined *Helicobacter pylori*, two studies examined hepatitis C, and one study examined methicillin-resistant *Staphylococcus aureus*. The study by Song et al [19] found that among those strains of *Helicobacter pylori* that undergo a quadruple therapy of esomeprazole, amoxicillin, clarithromycin, and tinidazole, there was a significant association found in the strains that were resistant to clarithromycin and metronidazole. The resistant group for amoxicillin only contained three people, which is the most likely reason that no significant association was found between the susceptible and resistant group. This significance demonstrates a significant population shift towards the resistant strains in both the cases of clarithromycin and metronidazole resistant strains following exposure to the quadruple therapy. Before the quadruple therapy, there were 72 populations of clarithromycin susceptible strains and 63 populations of clarithromycin resistant strains. After exposure, there were 6 populations of the susceptible strain in the patients and 16 populations of the resistant strain. In the metronidazole groups, the susceptible populations shifted from 44 to 3, while the resistant populations shifted from 91 to 19 populations. This observation is consistent with the shifting of antimicrobial resistance that has been shown in the United States. Among the studies that found a significant population shift following combination therapy, most populations shifted towards a predominance of the resistant strain. This was seen in both the *Helicobacter pylori* as well as *Hepatitis C* virus studies. It should be noted that the in vivo experiments analyzed in this systematic review were not optimized for the purpose of preventing the increasing proportions of antimicrobial resistance. Among the five papers analyzed that did not show a significant population shift, they all had comparison groups that involved less than twenty patients and in some cases the groups contained zero people. These studies were likely underpowered to show a significant difference. The studies used multiple different timings, drug combinations, and doses. These differences are likely to play a role in the shifting of the populations seen in these studies.

Figure 6. The CDC surveillance of *Salmonella* antimicrobial resistance trends from 1996 to 2015 shows an increase in the proportion of *Salmonella* strains that display a resistance to one or more of the following antibiotics: cephalothin, cefixime, ciprofloxacin, and nalidixic acid [24].

Figure 7. The CDC surveillance of *Shigella* antimicrobial resistance trends from 1996 to 2015 shows an increase in the proportion of *Shigella* strains that display a resistance to one or more of the following antibiotics: cefoxitin, ciprofloxacin, nalidixic acid, and streptomycin [24].

Figure 8. The CDC surveillance of *Escherichia coli* antimicrobial resistance trends from 1996 to 2015 shows an increase in the proportion of *Escherichia coli* strains that display a resistance to one or more of the following antibiotics: nalidixic acid, streptomycin, sulfameth/sulfiz, and tetracycline [24].

Figure 9. The CDC surveillance of *Campylobacter jejuni* antimicrobial resistance trends from 1996 to 2015 shows an increase in the proportion of *Campylobacter jejuni* strains that display a resistance to one or more of the following antibiotics: ciprofloxacin, nalidixic acid, telithromycin, and tetracycline [24].

DISCUSSION

The CDC created a tool to view the data regarding antibiotic resistance in bacteria isolated from humans through the National Antimicrobial Resistance Monitoring System. Figures 6-9 show trends over time of the resistance of four bacteria: *Salmonella*, *Shigella*, *Escherichia coli*, and *Campylobacter jejuni* against four common antimicrobials. The general trend is consistent with an increase of bacterial resistance to commonly used antibiotics [16]. These trends are heavily influenced by the current application of antibiotics in clinical practice. The variety of regimens currently employed to maximize efficacy are shifting the proportion of the population to favor resistant strains. This is the result of most experiments focusing on maximizing short term gains at the expense of long term losses. This decision process is simplified in figure 5.

Suppressive drug combinations are combinations of drugs that have a lower combined efficacy than the sum of its parts. One or more drugs must at least be partially antagonistic. The treatment with the highest efficacy is typically the favored treatment as long as cost and side effects are minimal.

Until recently the bias towards choosing the highest clinical efficacy did not appear to have major drawbacks, because the effect on antimicrobial resistance was not well understood. To illustrate this effect, researchers compared a suppressive drug combination versus a synergistic drug combination with high efficacy [20]. In the experiment, doxycycline-resistant and doxycycline-sensitive *Escherichia coli* were treated with either the additive drug combination of doxycycline and erythromycin or the suppressive combination of doxycycline and ciprofloxacin [20]. The suppressive combination resulted in the doxycycline susceptible strain out competing the doxycycline resistant strain, while synergistic pair resulted in the doxycycline resistant strain overtaking the population [20]. The results in the synergistic pair are in line with current clinical approaches and the observed population trends. The results of the suppressive combination provides in vitro evidence that demonstrates that these resistant strain population trends can be reversed. Another research group was able to demonstrate in vivo a specific mechanistic relationship among antagonistic suppressive antimicrobial combinations [21]. Specifically they tested a wide range of bactericidal and bacteriostatic pairs [21]. They were able to observe a population shift towards the bacteriostatic susceptible strain [21]. The strains that became resistant to the bacteriostatic drug went on to grow and incorporate a bactericidal drug, which resulted in the death of the bacteria that developed resistance to the bacteriostatic drug [21].

There are also exceptions to antagonistic combination being the best tradeoff between efficacy and drug resistance prevention. Mathematical models based upon *P. aeruginosa* have shown that under certain conditions the synergistic pair will have the highest efficacy and the highest prevention of antimicrobial resistance such as at the onset of infection when populations are low and competition for resources is limited [22]. The models suggest that prevention of antibiotic resistance is better served by antagonist combinations [22]. This understanding can help clinicians understand the best treatment for preventing resistance by discerning the microbial growth patterns in response to early interventions versus late interventions. Recent modeling of clinical interventions has capitalized on this understanding of competition for resources in population of susceptible versus resistant strains of bacteria. The models take advantage of an initial stage, where the susceptible strain over takes the

resistant strain [23]. There are several potential mechanisms to bring about this effect. The carrying of a resistant plasmid comes with the cost of reduced fitness in the absence of an antibiotic particularly when competition for resources is at its highest [23]. At capacity, the susceptible strain out competes the resistant strain [23]. Another example is activating the resistant genes that activate efflux pumps, which has the net effect of increasing the carrying cost of the resistant genes [23]. Once the population of resistant strains has been greatly reduced or altogether eliminated through competition, the synergistic combination of drugs would have optimal effects for highest efficacy as well as drug resistance prevention. These in vivo based models collectively represent a new approach to treating infectious disease and an evidenced based approach to reducing antimicrobial resistance.

CONCLUSION

This study provided a systematic review of the efficacy of combination drug therapies and their relationship with shifting the population of susceptible versus resistant strains of microorganism in in vivo studies. None of the in vivo study findings were significant for suppressive relationships that shifted the populations in favor of the susceptible strains as has been found in in vitro studies; however, none of the studies reviewed intended to use the combination therapy with the intent of suppression of the resistant populations. It is pertinent that physicians keep up to date with the recent studies pertaining to multi drug therapies and their effects on organisms. Further research should continue to be conducted in order to fully understand the efficacy of using multiple drugs in treating pathogens. Additionally, adherence to antimicrobial stewardship programs (ASPs) set out by the CDC can improve the spread of infections and therefore help to reduce the antibiotic resistance [25].

St. George's University, Grenada, West Indies

ABSTRACT

In Grenada, data on patients' knowledge and practices regarding the management of diabetes is virtually absent. The prevalence of diabetes is, however, relatively high in the country. The authors conducted this pilot study with a convenient sample of 20 patients in one clinic of which 8 had a low average HBA1c level (6-8%), 5 had a middle average HBA1c level (9-11%) and 7 had a high average HBA1c level (12->14%). Overall, 13 respondents used medication to manage the disease of which 4 also used diet and exercise. Fifteen respondents correctly identified diabetes as "higher than normal levels of sugar in the blood," however, only 12 correctly identified all the symptoms of diabetes in a list that was provided. Sixteen respondents stated they engaged in physical activities and 12 respondents did not follow a diet plan. The number of patients that regularly tested blood glucose levels and did eye checks was not exceptionally high. The results are indicative of a disconnect between knowledge and practice by the patients. An education program may be necessary, designed to reinforce knowledge leading to behavior change towards reducing blood sugar levels. The findings also highlight the need to monitor the impact of current programs and to develop new evidence-based interventions for the management of diabetes in Grenada. Finally, this pilot study can serve as a reference to guide in designing a study for a larger sample and serve as a baseline to compare findings regarding the management of diabetes in Grenada.

INTRODUCTION

Diabetes is a major global public health problem with increasing prevalence in middle and low-income countries [1]. The chronic condition develops when the pancreas does not produce sufficient insulin (type I diabetes) or when insulin is not efficiently metabolized in the body (type II diabetes) resulting in consistently high blood glucose levels [2]. Type 1 diabetes is diagnosed mostly in children and young adults while type II diabetes mostly affects middle-aged and older adults [2]. Diabetes can lead to progressive and debilitating complications of the brain, kidneys, heart, muscles and eyes [3]. Some of the complications caused by diabetes include weight gain, hypertension, blindness, amputation, neuropathy, stroke, coronary artery disease, end-stage renal disease, dialysis and eventually death [3].

The International Diabetes Federation (IDF) 2017 Atlas reported that approximately 425 million people worldwide or 8.8% of adults aged 20-79 years had diabetes and four million died from the complications. Approximately 79% of people with diabetes reside in low and middle-income countries. Based on the trends, it was estimated that by 2045, 629 million people within the age group will develop diabetes. Among the age group 20-79 years, 10.7% of all-cause global mortality was due to diabetes [4].

Diabetes has a considerable financial impact on the healthcare systems of countries as well as the affected individuals and their families. In many developing countries, diabetes treatment consumes 5-20% of the health care budget, with more than 50% of the cost arising from the treatment of complications [5]. Among the seven IDF regions, the North American and Caribbean region spend the highest amount on diabetes (20-79 years) estimated at 383 billion international dollars (ID). This corresponds to 52% of the total amount spent on diabetes treatment globally in 2017 [4]. In the Caribbean, the economic burden of diabetes was estimated by the Caribbean Public Health Agency (CARPHA) to be between 1.4% and 8% of the gross domestic product (GDP) [6].

In 2017, the prevalence of diabetes among persons aged 20-79 years in Grenada was 10.7% of the population [7]. Diabetes also ranked third among diseases that caused death on the island [8]. Between 1990-2013, the annual mortality rate (per 100,000 people) from diabetes has increased by 57.5% [9]. Additionally, since 1990, there has been an increase of 41.2% of annual years of healthy life lost (per 100,000 people) from diabetes. Alcohol, drug use, smoking tobacco, low physical activity, unhealthy diet, high body mass index and high fasting plasma glucose were some of the risk factors cited as contributing to deaths from diabetes in 2013 [9]. Exercise, diet and medication are beneficial for the prevention and management of diabetes.

The existing data shows diabetes is prevalent in Grenada and provides a basis for the development and implementation of interventions to prevent and manage the disease. To be effective, however, interventions must address gaps in knowledge, attitudes and behaviors of persons at risk and those affected by the disease. There is a paucity in published information regarding knowledge, attitudes and practices in relation to the management of diabetes in patients. The authors, therefore, conducted this pilot study at one clinic to understand factors that may be critical for addressing high blood glucose levels in Grenada. Further, the findings can be a useful reference for current programs to improve the effectiveness in addressing gaps in the system and behavioral risk that contribute to the high prevalence of the disease on the island. This pilot study does not allow for extrapolation to the wider population of patients

with diabetes. Nonetheless, the results can also provide an indication of the significance of variables for inclusion in future studies involving samples that are representative of the diabetic patient population.

OUR STUDY

This pilot study was approved by the Institutional Review Board (IRB) at St. George's University in Grenada [10]. The study was conducted at one clinic in the parish of St. George. Fifty patients who attend the outpatient clinic with a minimum of one record of abnormal HBA1c level were initially identified in the Patient Laboratory Database at the clinic, for participation in the survey. The selected patients were categorized according to high (12-14%), middle (9-11%) and low (6-8%) HBA1c levels. The inclusion and exclusion criteria for participation in the study were as follow:

Inclusion criteria

- Patients aged 20-79 years
- Male and female patients
- Diagnosis of type 2 diabetes
- A minimum of 1 record of abnormal HBAIC levels ranging from 6% - >14%
- Utilize the services at the outpatient clinic .

Exclusion criteria

- Diagnosis of type 1 diabetes
- Patients not diagnosed with abnormal HBAIC levels ranging from 6% - >14%

Development of the Data Collection Instrument

The data collection instrument consisted of 41 questions adapted from the study conducted by Beaubrun-Toby in Trinidad in 2014 [11] and from the Diabetes Attitude Survey provided online by the University of Michigan Diabetes Research and Training Center [12]. Open-ended, closed-ended and Likert scale questions were included in four sections: demographics, knowledge of diabetes, attitude towards diabetes, and diet and health practices in relation to managing diabetes. Pilot testing for clarity and comprehension of the instrument was done with five staff members and patients at the clinic. The instrument was revised to include recommendations from the pilot group and other revisions to improve clarity and ease of use of the instrument.

Recruitment and Administration and Analysis

Participants were contacted by the principal investigator (PI) to secure approval for their participation in the study. Informed consent was required for participation in the survey. Patients who consented were invited to do the survey at the clinic. Of the 46 patients contacted, 25 consented to participate in the study, however, questionnaires were completed by 20 patients. Convenience sampling was therefore used in this study.

The survey was administered face to face by the PI over a twelve-week period between November 26th, 2018 to February 15, 2019. Responses were recorded on the questionnaire. The responses were entered into a Microsoft Excel spreadsheet and imported into SPSS. The frequency of responses was analyzed and reported. Compensation was not provided for participation in the study.

FINDINGS

The study was conducted with 20 patients, with the majority (11, 55.0%) residing in the parish of St George. More females (11, 55.0%) participated in the study than males (9, 45.0%). The majority, (13, 65.0%), of respondents were in the age group 51-65 years. The most frequent weight of the respondents (8, 40.0%) was 151-200 pounds. The most frequent heights were 5 ft 6 inches - 5 ft 12 inches (7, 35.0%) and 5 ft - 5 ft 5 inches (6, 30.0%), respectively. Most respondents were married (11, 55.0%) and employed full time (11, 55.0%). The highest levels of education attained by respondents were primary school (5, 25.0%) and secondary school (6, 30.0%). Table 1 shows the demographic information for the respondents.

No response	6	30.0

DIAGNOSIS AND TREATMENT

The respondents reported on the time they were diagnosed with diabetes. One quarter (5, 25.0%) reported they were diagnosed more than ten years ago while (6, 30.0%) reported they were not diagnosed. One (5.0%) reported they were diagnosed less than one year ago and 3-5 years ago, respectively; three (15.0%) reported 1-2 years ago and 6-10 years ago, respectively. Table 1 shows the time at which patients reported they were diagnosed with diabetes. Of the 20 respondents, 8 (40.0%) had a low average HBA1c level (6-8%), 5 (25.0%) had a middle average HBA1c level (9-11%) and 7 (35.0%) had a high average HBA1c level (12->14%). Figure 1 shows the proportion of respondents by HBA1c levels.

Figure 1. HbA1c categories of the respondents.

Figure 2. Patient responses regarding the use of medication to manage diabetes.

Table 2. Patients responses on measures to control diabetes

Method of Control	Low HbA1c levels n=8	Middle HbA1c levels n=5	High HbA1c levels n=7	Total HbA1c levels n=20
Insulin only	0 (0.0)	0 (0.0)	1 (14.3%)	1 (5.0%)
Diabetes Medication only	1 (12.5%)	2 (40.0%)	2 (28.6%)	5 (25.0%)
Insulin + Diabetes Medication only	0 (0.0)	1 (20.0%)	2 (28.6%)	3 (15.0%)
Diet only	1 (12.5%)	0 (0.0)	0 (0.0)	1 (5.0%)
Exercise only	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)
Diet + Exercise only	2 (25.0%)	0 (0.0)	0 (0.0)	2 (10.0%)
Diabetes medication + Diet+ Exercise	0 (0.0)	1 (20.0%)	0 (0.0)	1 (5.0%)
Insulin + Medication + Diet	0 (0.0)	1 (20.0%)	0 (0.0)	1 (5.0%)
Insulin + Diet + Exercise	0 (0.0)	0 (0.0)	1 (14.3%)	1 (5.0%)
Insulin + Medication + Diet + Exercise	0 (0.0)	0 (0.0)	1 (14.3%)	1 (5.0%)
No answer	2 (25.0%)	0 (0.0)	0 (0.0)	2 (10.0%)
Not applicable	2 (25.0%)	0 (0.0)	0 (0.0)	2 (10.0%)

In the Low HBA1c level category (n=8), only 1(12.5%) respondent used medication to manage their diabetes, one (12.5%) used diet only and 2(25.0%) used diet and exercise. One quarter (25.0%) in that category did not respond and an equal percentage indicated that the question was not applicable to them. In the middle (n=5) and high HBA1c level category (n=7), all respondents used insulin or other medication to manage the disease. In the middle category, two (40.0%) also used diet and exercise along with insulin/medication. In the high category, two (28.5%) used diet and exercise along with insulin/medication. Overall, 13 (65.0%) of the respondents used insulin/medication of which four (30.0%) also used diet and exercise and three (15.0%) only used diet and exercise to control the disease. Table 2 and Figure 2 show information about the measures used by the respondents to manage diabetes.

Knowledge of Diabetes and Control Measures

Regarding the definition of diabetes, the majority (15, 75.0%) of respondents correctly selected “higher than normal levels of sugar in the blood.” Regarding identifying symptoms of diabetes, most of the respondents (12, 60.0%) correctly selected “all of the above” which included slow healing of wounds, increased tiredness, increased frequency of urination at night and increased thirst and hunger. Eighteen (90.0%) of respondents stated the correct way to monitor diabetes is to “check blood glucose levels.” Two (10.0%) respondents did not know of any way to correctly monitor diabetes. Twelve (60.0%) respondents stated blood glucose levels should be checked once “every day” if using another measure to control diabetes. Seven (35.0%) respondents felt diabetic patients should have their eyes checked “once every six months,” an equal number of respondents felt the check should be done “once a year” and five (25.0%) stated they “did not know” how often the check should be done.

Table 3. Patients agreement with statements regarding diabetes

	Strongly Agree		Agree		Neutral		Disagree		Strongly Disagree	
	n	%	n	%	n	%	n	%	n	%
In general, I believe that what I do as a diabetic patient has more effect on my health than anything that a doctor, nurse or dietician can do	11	55.0	6	30.0	2	10.0	1	5.0	0	0.0
In general, I believe that as a diabetic patient, I should learn a lot about the disease so I can manage my own diabetic care	12	60.0	7	35.0	1	5.0	0	0.0	0	0.0
In general, I believe that I can prevent the complications of diabetes by keeping my blood sugar close to normal	12	60.0	7	35.0	1	5.0	0	0.0	0	0.0
In general, I believe that people whose diabetes is treated by just a diet do not have to worry about getting many long-term complications	0	0.0	6	30.0	3	15.0	7	35.0	2	10.0
In general, I believe that it is frustrating for people with diabetes to take care of their disease	1	5.0	10	50.0	2	10.0	3	15.0	2	10.0

Eight (40.0%) of respondents correctly stated regular urine test will help monitor “how well the kidneys are functioning” and seven (35.0%) stated they “did not know” what regular urine test would help monitor. Regarding proper foot care, the respondents were allowed to

select more than one answer. Eight (40.0%) respondents selected “choose the best possible footwear,” 10 (50.0%) selected “inspect and wash feet every day” and seven (45.0%) selected “not walk barefoot inside and outside the house.”

When asked about control factors for blood sugar, most of the respondents (14, 75.0%) selected the option “all of the above” which included regular exercise, a well-balanced diet and medication. In relation to the treatment of diabetes, 16 (80.0%) indicated diabetes can be treated by blood sugar lowering medication of which three (19.0%) also selected eating bitter vegetables. When asked about problems that may arise from untreated diabetes, the majority (18, 85.0%) selected the option “all of the above” which included eye problems, kidney problems, foot ulcers and heart problems.

Attitude towards Diabetes

The respondents were asked to state their level of agreement with statements about diabetes. Table 3 shows the responses. Generally, the majority (55-60.0%) of respondents strongly agreed or agreed with correct statements while 10.0-20.0% disagreed with statements.

Diet and Health Practices

The respondents were asked about diet and health practices. The majority (16, 80.0%) stated they exercised or engaged in physical activities. Some of the activities included walking (8, 40.0%), going to the gym or exercising on a machine (5, 25.0%), running (1, 5.0%), gardening (1, 5.0%), playing sports (1, 5.0%). Three (15.0%) of the respondents did not state an activity but indicated that were active, generally.

Figure 3. Patients responses regarding reasons for not following controlled diet/meal plan.

With regards to following a controlled diet/meal plan, 12, (60.0%) of the respondents did not follow a plan. The reasons indicated for not following a controlled diet/meal plan included lack of time (4, 20.0%), not having a diet plan (4, 20.0%) too much trouble (3,

15.0%), financial limitations (1, 5.0%), not liking food (1, 5.0%). Figure 3 shows reasons for not following a controlled diet to manage diabetes.

Table 4. Patient responses regarding diet and health practice

Questions	Low HBA1c level n (%)	Middle HBA1c level n (%)	High HBA1c level n (%)	All HBA1c levels n (%)
Exercise/ Engage in physical activity	6 (75.0)	4 (80.0)	6 (85.7)	16 (80.0)
Follows controlled diet plan	1 (12.5)	3 (60.0)	3 (42.9)	7 (35.0)
*Does not miss medication	1 (12.5)	2 (40.0)	3 (42.9)	6 (30.0)
Eye examination 1 year ago or less	5 (62.5)	3 (60.0)	4 (57.1)	12 (60.0)
Urine check 1 month ago or less	2 (25.0)	0 (0.0)	3 (42.9)	5 (25.0)
HBA1c/blood glucose test 1 month ago or less	3 (37.5)	3 (60.0%)	5 (71.4)	11 (55.0)
Fruit consumption > 3x per week	4 (50.0)	5 (100)	5 (71.4)	14 (70.0)
Green vegetables, non starch vegetables and legumes > 3x per week	4 (50.0)	3 (60.0)	3 (42.9)	10 (50.0)
Food not prepared at home < 1x per week	5 (62.5)	2 (40.0)	4 (57.1)	11 (55.0)
Sweetened drinks <1x per week	4 (50.0)	4 (80.0)	5 (71.4)	13 (65.0)
Alcohol <2x per week	7 (87.5)	5 (100)	7 (100)	19 (95.0)
Does not smoke	8 (100)	5 (100)	7 (100)	20 (100)

*One patient in the low HBA1c category took medication for their diabetes. All patients in the middle and high HBA1c category took medication for their diabetes.

Twelve (60.0%) respondents had their eye examination within the last year, 5 (25.0%) had their urine checked within the last month and 11 (55.0%) had their blood glucose/HBA1c test done within the last month. Fruits were consumed more than three times per week by 14 (70.0%) respondents while 10 (50.0%) have meals which consist of green leafy vegetables, non-starch vegetables and legumes more than three times per week; 11 (55.0%) consumed food not prepared at home less than one time per week; 13 (65.0%) drink sugar-sweetened drinks less than one time per week; 19 (95.0%) consumed alcohol less than twice per week and none of the respondents smoked. Table 4 shows the diet and health practices of the respondents.

DISCUSSION

This pilot study was conducted to investigate knowledge, attitude and practices of patients with type 2 diabetes at one clinic in Grenada. Published data is virtually absent on the KAP of diabetic patients in Grenada. This study, therefore, provided an indication of the factors that may be critical for developing interventions to prevent and manage diabetes in Grenada. The findings can also be used to inform changes in current interventions to improve effectiveness by targeting specific issues in relations to knowledge and practices. The results can provide an indication of the significance of variables for inclusion in future studies involving samples that are representative of the diabetic patient population. This small pilot study does not allow for extrapolation to the wider population of patients with diabetes.

The study in Grenada was indicative of the patients having extensive knowledge about diabetes. It appeared that the results of the study, regarding knowledge about diabetes, may differ from the general findings in a study in Trinidad, a neighboring Caribbean country. The findings from the KAP study in Trinidad indicated that the knowledge of the patients with

diabetes was above a basic understanding [11]. However, their knowledge seemed to be limited to understanding symptoms, possible complications of diabetes, what is required to control blood sugar levels and diabetic diet requirements. There appeared to be a lack of knowledge about the causes, nature and treatment of diabetes [11].

Although the respondents in Grenada seemed to be generally knowledgeable about diabetes, the findings also indicated they did not engage sufficiently in practices to manage the disease. The frequencies of activities such as regularly testing blood glucose levels, doing regular eye checks, and following a diet plan were not exceptionally high among the patients. This shows a disconnect between knowledge and practice which is an important point of entry for intervention. An education program may be necessary, designed to reinforce knowledge leading to behavior change. The finding also highlights the need for monitoring the impacts of programs. A system should be developed to ensure that patients who access care in both private and public facilities are monitored to determine how the type of care provided impacts the patient health outcome.

Although most of the patients selected the correct response for how diabetes can be treated, it is interesting to note that a small percentage of participants also indicated that the disease can be treated by eating bitter vegetables. Although this may appear to be insignificant in this study, this response can be an indication of a practice that should be explored further especially within Caribbean societies where herbal medicines are commonly used to manage health problems. Regarding proper foot care, the responses varied with approximately half of the patients selecting one response although the question consisted of more than one correct answer choice. This pattern in the response indicated gaps in knowledge regarding healthy practices to minimize complications.

With regards to attitude towards diabetes, most of the respondents agreed with correct statements. Similar results were obtained from the KAP study in Trinidad and the authors found that the patients may be receptive to diabetes education [11]. However, half of the patients in the Grenada study indicated that it was frustrating for people with diabetes to manage the disease. Frustration may be a deterrent to accessing education. Other factors, such as family support and stigmatization, may also be deterrents. Data from a study with diabetic patients in Malaysia showed that factors outside of knowledge and attitude also had a significant bearing on patient management of the disease [13]. Some possible factors identified in Malaysia were poor self-management, lack of motivation and lack of resources to maintain modification of behavior or lifestyle [13]. Apart from education programs, intra-personal, community, organizational and policy support should be considered to create a holistic enabling environment for behavior change in the management of diabetes. Such change will not only benefit the individual but is vital to reduce the national economic burden associated with providing care for diabetic patients. CARPHA estimated between 1.4% and 8% of the GDP in Caribbean countries was allocated for treating diabetes and related complications [6]. Such allocations may instead be diverted to also provide preventive care.

These findings were similar to the study done in Trinidad where close to half of the patients reported that they did not adhere to the recommended diet [11]. In addition to physical activity, following a proper diet also plays a major role in the management of diabetes. The issue of diabetic patients not having a diet/meal plan needs further evaluation. Meanwhile, some interventions should be developed to address this issue among patients that use the facilities at the clinic. On the other hand, it was commendable that more than half of the patients reported they engaged in physical activities. Physical activity is an important

factor for metabolic improvements and to decrease mortality from the disease. Maintaining physical activities can be a difficult routine for patients. Less than half of the participants in the Malaysian KAP study reported that they exercised regularly [13]. Facilities and programs should be established to motivate patients to exercise regularly. Such programs may include incentives for maintaining healthy behaviors.

It was also interesting to note that some respondents with HBA1c levels between 6.4% and 6.7% did not believe they were diabetic. Therefore, they did not believe some of the questions in the questionnaire were applicable to them or did not adhere to some of the diet and health practices that were necessary for the management of diabetes. According to the American Diabetes Association, the range for pre-diabetes is 5.7%-6.4% and for diabetes is 6.5% or higher [14]. While these patients may not be on medication and their HBA1c levels may fluctuate between the pre-diabetic and diabetic ranges, it is imperative that proper diet and health practices be utilized to prevent an increase of blood glucose to unhealthy levels.

CONCLUSION

In conclusion, findings from this study indicate slightly above-average levels of knowledge, attitude and practices among the patients with diabetes attending the outpatient clinic in Grenada. Albeit, there may be no direct relationship between knowledge and practices as the frequencies of taking action to manage diabetes was not exceptionally high. This study is limited by the small sample size and the findings cannot be extrapolated to the general population of persons with diabetes in Grenada. The patients, however, should engage more actively in self-management and remain committed to lifestyle changes. Additionally, adequate social support has been linked to improved long term disease management, glucose control and health outcomes [13]. Possessing the ability to adapt is also an important skill for managing the disease. Overall, a collaborative effort between patients, health care professionals, family members and peers are essential for creating a supportive environment towards managing diabetes. Support can also be provided through accommodating patients' lifestyle changes and dietary needs and monitoring behavioral change progress. Providing critical support can empower the patient to understand and manage diabetes effectively [13].

ACKNOWLEDGMENTS

The authors acknowledge and thank the participants in this study. The management and staff of St. Augustine's Medical Services are also specially recognized for the support provided for this study. Thanks to the staff in the Department of Public Health and Preventive Medicine at St. George's University for providing guidance and technical support for conducting this study.

Chapter 76

CARNIVAL BACCHANAL CULTURE AND THE SILENT HIV RISK AMONG FEMALE CARIBBEAN PROFESSIONALS

Shivaughn Hem-Lee-Forsyth^{*}, PhD, MPH

Department of Public Health and Preventive Medicine,
St. George's University School of Medicine, St. George's, Grenada

ABSTRACT

The feminisation of HIV and AIDS globally has significantly impacted Caribbean nations. Within the last 10-15 years, West Indian females have been disproportionately affected by the spread of HIV at a 3-6 times higher rate than males. This qualitative study explored the sexual behaviours and practices of professional, Caribbean women and their perceived susceptibility to HIV and AIDS: generally, in the broad context of everyday life, and specifically, during the Carnival season. The study also examined the extents to which, in the context of Caribbean culture, professional women felt in command of their health. The study therefore sought to determine if the sexual behaviours and practices of professional women, increased their vulnerability to HIV. Participants were selected from Grenada and Trinidad, known HIV low and high-risk islands respectively. Carnival activities are dominated by women between ages 18-40 years. As such, the study population comprised professional women aged 25-40 years. A cross sectional approach using qualitative research methods was employed: participant observations, interviews and focus groups. It was found that education was not a significant driver of safe sex decision-making. Rather, it was the varying attitudes and perspectives regarding sexuality and the degree of empowerment in relation to physical, sexual, mental, emotional and social well-being that determined safe sex practices. These findings lay a comprehensive and preliminary foundation that can be used to buttress future research on this, traditionally, underexplored area related to the socio-cultural factors that lead to the feminisation of HIV and AIDS in the Caribbean.

INTRODUCTION

HIV and AIDS is the leading cause of death in the Caribbean among male and female persons between the ages 20-59 years; unprotected sexual encounters between heterosexuals account for the primary means of transmission [1]. Females currently contract HIV at a significantly higher rate than males [2]. Such statistics have been the driving force that catalysed and intensified the amalgamation of efforts among health and gender agencies, at both local and regional levels. The frequency and disproportionate manners in which West Indian women are contracting HIV, as compared to men, has led to the feminisation of HIV; a development with far reaching public health and social consequences that has been largely overlooked in academia.

HIV and its transmission pose a greater threat to Caribbean women as a result of circumstances such as: anatomical composition, geographic location, finance, education, social conditioning and culture. In Trinidad and Tobago, 49.5% of the existing HIV positive cases are men, and 45% are women [3]. Among this population, 40% of them are in the age range of 15-24 years, and 70% of those infected between the age range 15-54 years were females [4]. This represents a much higher percentage of women being infected compared to women living in countries of the Organisation for Economic Co-operation and Development, which includes Grenada [5]. In the male population, HIV is usually prevalent in the age group 45-49 years [6]. In Grenada, in early 2013, 43% of HIV patients were women. There were 334 males and 183 females diagnosed with or currently living with HIV [7]. In 2010, 95% and 91% of pregnant women received HIV testing in Grenada and in Trinidad respectively [8]. This data clearly shows that although HIV is a public health issue, it is also an urgent gender issue [9].

The American Psychological Association [10] asserts that there is a link between low socio-economic status and high-risk sexual behavior among women. Impoverished women may engage in riskier practices making them more susceptible to HIV [11]. The increased accessibility to robust income sources and medical care that is facilitated by completion of higher education should, logically, result in a lower risk of the professional woman contracting HIV. However, a dearth of available research and literature to support this hypothesis demonstrates that the target population: professional Caribbean women, remains under explored.

Carnival is an annual festival of music, dance, alcohol consumption, fetes and masquerade parades. It has become synonymous with bacchanal and abdication of sexual inhibition. In Trinidad, Carnival is a national event, drawing thousands of tourists to the capital city, Port of Spain [12]. It is an enormous party and ranks alongside the Rio de Janeiro Carnival in Brazil in popularity [13]. Grenada's Carnival or 'Spicemas' is substantially smaller than that of Trinidad, but equally renowned for its sensory splendour, colour and revelry.

The purpose of this study has been to investigate a significantly important, yet under researched area in the HIV discourse: the perception of professional women towards themselves; their cultural perspectives on gender and sexual relationships; and how these attitudes influence their sense of empowerment on expressions of their sexuality and safe sex experiences. Using Carnival bacchanal as a hypersexualised site for examination of sexual behaviour, the following have been queried: the degree to which participants demonstrate

self-love and self-efficacy by protecting themselves, both physically and emotionally, in their intimate liaisons; their locus of control vis-à-vis HIV risk exposure; and the influence of tertiary and sex education on their ability to manage their mental and sexual welfare.

OUR STUDY

Carnival activities are dominated by women in the age group 18-40 years. As such, the target population was professional Caribbean women aged 25-40 years, from Grenada and Trinidad. ‘Caribbean woman’ was defined as a woman who spent her formative years in the Caribbean. ‘Professional woman’ was defined as one who attended university and had at least one degree. Sixty participants (see table 1) were randomly selected, from a pool of 80 candidates, and comprised the total sample population. All participants engaged in interviews and/or focus group discussions. To anonymise the participants, different identities were given. The investigation adopted a cross sectional approach using qualitative data collection methods (see figure 1) [14].

Table 1. Participant demographics

Demographics	Variables	Participants
Ages		
	25-30	21
	31-35	19
	36-40	20
Religion		
	Christian	47
	Hindus	5
	Muslim	4
	Other	2
	Atheist	2
Marital Status		
	Married (includes common law)	20
	Separated	2
	Single	35
	Divorced	3
Offspring		
	Children	15
	No children	45
Total		60

An ethnographic map (see figure 2) was drawn up to select participants, where, according to Heckathorn [15], ‘an initial sample [forms] the basis for network sampling’ [15]. This approach was utilised because of its effectiveness to obtain a wide cross-section of participants who met the study criteria. Multiple data collection methods were used for fieldwork to provide depth to the research design and interpretation [16, 17]. Primary data collection involved a complementary methodology (see figure 3) [18]: participant observations, interviews, focus groups and stakeholders’ meetings.

Figure 1. Qualitative research data.

Figure 2. Ethnographic map.

Figure 3. Data collection methods.

Observations were made at 10 different Carnival events. This method offered more credible, first-hand information to describe happenings and arrive at interpretations of them [19]. Interviews and focus groups were held at two universities in Trinidad and Grenada, in a three-week period leading up to the Carnivals. There were 30 semi-structured interviews (see table 2) lasting 1.5 hours each. Six focus groups (see table 3) lasting two hours each, consisting of 5-7 persons were held. Twenty stakeholder meetings, which involved both open and close-ended questions, occurred at the participants' workplaces, and lasted two hours each.

Ethics approval required focus groups to be held centrally in University settings, resulting in a lack of flexibility in hosting sessions in multiple locations. Since protection of privacy was of paramount importance, this kind of variance in venues would have decreased the likelihood of participants being grouped with an acquaintance. This may or may not have contributed to some reticence on the parts of participants who would have preferred to fully maintain their privacy.

Table 2. Interview questions Part A, Part B, and Part C

Part A
Objective: Perception of professional woman toward herself and her sexual partners
<i>To find out how professional women view themselves in relation to men</i>
Would you consider yourself a femme fatale (i.e., an irresistibly attractive woman, especially one who leads men into difficult, dangerous, or disastrous situations)? Why?
Do you consider yourself a sex goddess (i.e., knowing that when you walk into a room, you look fantastic, you are going to turn heads, and that men there are looking at you, thereby giving you that power which makes you feel like a sex goddess)? Why?
Do you consider yourself a sexually adventurous (i.e., bold, daring, exciting, willingness to try new things, fascinated to learn about sex) young woman? Why?
Can you suggest some of the other ways women may consider themselves and why?
<i>To evaluate whether professional women believe in equality between the sexes</i>
Do you believe in feminism (i.e., belief in the social, political, and economic equality of the sexes)? In what ways?
What do you think about equality between the sexes? Is it important to you and your partner in your relationship? To what extent and why?
<i>To assess the role of men in the lives of professional women</i>
Can you tell me a little about whether or not it is important for you to have male partner in your life? Can you give some of your reasons for this?
Generally, do you think that the presence of a male contributes to your happiness? Please explain.
Do you ever give much consideration to your partners' earning capacity in relation to your own? Is this an important issue for you and why?
Part B
Objective: To investigate the attitudes of professional women toward safe sex practices and HIV/AIDS and how these are reflected in their behaviours
<i>To understand the impact of tertiary education on safe sex practices</i>
Do you think that your educational positively and/or negatively influences the application of knowledge about safe sexual practices and behaviours in the everyday living of professional Caribbean women?
With regard to your decisions around sex, have you been contented with the decisions in the past compared with those you are currently making? Do you care to share how so?
<i>To learn about the types of sexual relationships of interest to professional women</i>
What kind of sexual relationships are you interested in- a short or a long term? Can you explain the reasons for this?
Generally, do you feel in control of your choice of sexual partners? Please explain.
Are you interested in engaging in relationships of convenience? (i.e., relationships that fulfil some of your needs as opposed to most of your needs)? If yes, why? If no, why not?
How do you and your partner handle the issue of fidelity? (e.g., is it openly discussed, do you have an open relationship?)

<i>To investigate the safe sex practices of professional women</i>
What does safe sex mean to you? Does this include any medical testing for STIs/HIV? Are you encouraged by your sexual partner/s to practise safe sex? Do you encourage your sexual partners to practise safe sex?
Have you thought about whether or not economic empowerment directly influences safe sex practices for women? In what ways do you think?
<i>To explore professional women's views on various relationship choices in Caribbean culture</i>
What do you think about sex in a monogamous relationship? (i.e., the practice or condition of having a single sexual partner during a period of time)? Is it one that should be physically gratifying, emotional, for safe sex practices etc.?
How do you regard partners who engage in a in a down-low lifestyle (i.e., the behaviour of men who have sex with other men [MSM], as well as with women, but who do not identify as gay or bisexual)? What would you do if you became aware that your partner is on the downlow?
What do you think about women who engage in social prostitution (i.e., where a person may have a sexual relationship with a person in exchange for material gains)?
What are your thoughts on polygamy? (i.e., the practice or condition of having more than one spouse, especially wife, at one time)? Why?
Do you think that professional women engage in multiple sexual partnering (i.e., having more than one sexual partner at the same time)? If so, what in your view might be the reasons?
In your opinion, are professional women open to polyamorous relationships (i.e., the practice pertaining to participation in multiple and simultaneous loving or sexual relationships)? Why do you think this might be so?
Part C
Objective: The influence of Carnival on certain kinds of sexual behaviour on the part of professional women
<i>To find out about professional women's perceptions of Carnival culture</i>
How would you define a Carnival party animal? Would you consider yourself a party animal when it comes to the Carnival season?
Do you believe that wearing revealing clothing to Carnival events influences professional women's own behaviour and how they are viewed by the opposite sex?
<i>To enquire about the value of Carnival celebrations and its impact on the lives of professional women</i>
What do pre-Carnival events (e.g., fetes, cruise, shows etc.) mean to you? Are they considered an important part of the build up to Carnival?
Do you play mas (i.e., join in a Carnival costume band and parade on the streets) for Carnival? Do you enjoy them?
Is alcohol use during Carnival an integral part of enjoying your Carnival activities? If yes, why? If not, why not?
Do people's perceptions of your behaviour (e.g., dancing, alcohol consumption etc.) influence your behaviour around Carnival time?
Generally, do you think that professional women engage in more sexual activity during Carnival time? Why would you say so?

Table 3. Focus group questions Part A and Part B

Part A
Objective: Cultural perspectives of professional women on gender and sexual relationships
<i>To find out whether women are regarded as being repressed or dominated by men</i>
What are your thoughts on patriarchal society (i.e., society being under the repressive domination of men) in the Caribbean context?
<i>To discover whether or not women believe that machismo is a reality in Caribbean society</i>
Do you believe that machismo (i.e., the belief that the man is the provider and dominant one; he is independent, strong and willing to face danger) is a pervasive reality in our Caribbean societies today?
<i>To determine whether or not women believe in marianismo</i>
In what ways is marianismo (i.e., it is the portrayal of the ideal woman as being modest, pure, dependant, weak, vulnerable and abstinent until marriage. When married, the woman becomes subordinate and obedient to her spouse) manifested in the lives of professional women?
<i>To ascertain how professional women view themselves in relation to men</i>
Do you think that women view themselves as equal to men? Why?
Do you think that patriarchal practices are still upheld in their relations with men? How?
Do you believe that there are times when a woman should be submissive to a man based on religious or social norms?
Does emotional dependence on a male partner play a role in determining your self-worth?
Do you think sexual intimacy with a man is important for women to feel loved? Why?

<i>To establish whether or not particular age groups of men are more appealing or sexually attractive to professional women</i>
Which groups of men do you find most appealing to you and why? (e.g., employed or unemployed professional men OR employed or unemployed unprofessional men).
<i>To investigate the kinds of relationships professional women would consider having with men</i>
What kinds of relationships do you think professional women are interested in? Short-term or long-term relationship? (e.g., sexual intimacy, financial partnership, emotional bonding, fathering of kids, companionship etc.)
<i>To uncover whether professional women feel that they are more capable of finding partners over other non-professional women</i>
In today's Caribbean societies, do you think that professional women are at an advantage or disadvantage over other women in securing the best possible choices of sexual partners? (Are they seen as more appealing or less appealing to the opposite sex?) Why?
<i>To learn how women view women's self-empowerment and sexual liberation</i>
Would you say that a woman's independence gives her the 'permission' to make liberated choices regarding her sexuality (e.g., have multiple sexual partners, short term relations etc.)?
Part B
Objective: Attitudes of professional women toward safe sex practices and HIV/AIDS during Carnival time.
<i>To find out whether the practice of masturbation assists in reducing unsafe sexual practices</i>
Do you think that women who engage in masturbation (the stimulation or manipulation of one's own genitals, especially to orgasm; sexual self-gratification) are less likely to seek out a sexual partner in these modern times? Why?
<i>To elicit information about the perceptions of Carnival and the human psyche</i>
Based on what you've experienced in previous years, do you think that the Carnival culture perpetuates the objectification of all women certain groups of women? (e.g., younger aged women, women dressed in a particular way, less educated women, women with lower earnings etc.) How and why?
Carnival is a time when people tend to free themselves from life's daily challenges. It is culturally rich in music and dance and people tend to spend time engaging in parties and other pleasure and leisure times. Do you think that Carnival is also seen as a time to be sexually free?
<i>To probe whether Carnival music, dress and use of alcohol are considered conducive to heightened sexual activity and why?</i>
There has been a significant increase in births 9 months post-Carnival, which provides evidence that women are engaging in more unprotected sexual activity around that time. Are you of the belief that Carnival provides the opportunity for women to engage in unsafe sexual practices?
<i>To uncover if particularly provocative dance movements and music influence sexual practices and behaviours</i>
Do you think that the wine and jam culture associated with Carnival influences the sexual choices that professional women make? If so, in what ways?
<i>To determine if professional women think differently from other women about making sexual choices</i>
Professional women are perceived as being financially independent. Does this independence give them a feeling of being sexually liberated by having several non-committal sexual partners?
<i>To explore whether or not professional women are considered to be at risk of STIs because of sexual practices</i>
Can the attainment of a tertiary education be seen as having a positive impact on all aspects of a woman's life? As such, are professional women more inclined to practise safe sex all the times, sometimes, not sure?

DATA ANALYSIS

Recorded data from interviews and focus group discussions were transcribed and processed using NVivo software. Field notes from observations were also collated. Key issues were identified and organised according to themes and subthemes using word document files. NVivo was then used to store, categorise and code the data. Triangulation of data to see where key themes intersected [20, 21] involved descriptive and explanatory data coding. Clearly defined codes, consisting of key words and phrases for location of specific themes, were created. Using the associations among themes, a thematic analysis was carried out and conclusions were drawn [22] on the sexual practices of the participants, and their role in the feminisation of HIV.

The sexual practices of professional Caribbean women, and their HIV risk have not been researched in-depth prior to this study. The field work's focus entailed examination of what was happening within a specific time frame, with a specific group of women. It was not intended to show what could have happened in the future, so it was irrelevant to gauge dependability of the study. The project did not necessitate transferability [23] to other countries or other groups of women. Precedence was given to documenting insights into what was happening, and why, as opposed to the extent to which attitudes, behaviors and practices among professional women were the same. Given the project's phenomenological nature, the emphasis targeted procedural rigour [23] and what Gray [17] described as 'contextual description and analysis' [17]. Research was conducted in low and high-risk islands and produced similar findings, which was indicative of some measure of generalisability within the Caribbean.

Confirmability of findings [24] was important, thus, field observations as participant observer and experiences and sentiments of interviewees were shared with focus group participants. The study's validity was maintained through researcher analytic reflexivity and evaluative rigour [17, 25]. Through respondent validation, the participants as judges of their own experiences, confirmed or refuted findings. Their views in the data triangulation process lent further credibility to the study.

FINDINGS

Participants gave a multiplicity of perspectives on the feminisation of HIV and their role in the epidemic. This was contextualised through these women's gendered stories on the politics of self-identity and self-awareness; femininity and womanhood; sexual health education discourse; and the hypersexualised Carnival culture.

Feminism

In examining feminist consciousness, most participants identified as feminists. After exploration was made into the cultural nuances regarding what it meant to be male and female in that social context, the prevailing sentiment was that men and women were different and having 'equal status' in relationships was not a necessity. Overall, participants claimed that independence, in the form of economic imperatives, was very important to them. Self-sufficiency and self-worth were crucial to their notion of the feminist ideal.

Many respondents believed that for women, feminists or not, forming bonds with men was natural and important. They wanted men to care for them, but not have automatic power and control over them. Participants concluded that, for many, it was more alluring to be in an unsatisfying relationship than in none at all. In fact, some women willingly assumed submissive roles, while giving in to men's feelings of entitlement and authority.

Female Sexual Identity and the Femme Fatale

Participants believed that women who were considered sex goddesses were sexually audacious and self-loving. Conversely, participants articulated that some women with exaggerated displays of self-confidence were deliberately trying to mask low self-esteem. There was consensus that female sexual identity was shaped by inner workings and by other people's perceptions. Women relished attention often couched in sexual innuendos. Participants averred that women's preoccupation with physicality was inextricably linked to attempts at using the body as a tool to tantalise the opposite sex.

Personal attributes like a love of danger and short-lived thrills might have made it easier to engage in risky sexual encounters. Participants claimed that educated women might have been more aware of HIV risk and that may or may not have influenced their sexual partnering decisions. As the interviews addressed sexual risk more personally, there was more reticence; women disassociated themselves from the femme fatale mentality when addressing their own personal escapades. Focus group participants established that risk taking behaviour showed ignorance and naivety, which resulted in detrimental consequences. In theory, these educated women claimed that there was a need to be sexually responsible, yet their actions showed the antithesis to self-love and protection of the body.

Male-Female Relations and Gender Equality

This study demonstrated that long term bonding from relationships was a vital self-esteem booster. Ubiquitous interference and pressure from society was noted to be humiliating for women without partners. Women with companions gave the impression that they had fewer episodes of insecurity. Data findings revealed a paradigm shift in the assignment of gender roles. Although participants praised their heritage, they were critical of the social norms that did not seek to uphold gender justice. As ostensible lovers of modernity and progressive thinking, they embraced a new social mandate that promoted equality and anti-patriarchal politics.

There was unanimous agreement that in this system of entrenched male privilege, men were granted a license for sexual freedom. Some contributors expressed they were disenchanted with the ways women acquiesced to Caribbean machismo culture. It was affirmed that women simply tolerated it as their fate; as a means of attaining a partner and social acceptance. It was not clear as to the degree to which empowered women accepted or rejected equality in its various manifestations in romantic relationships.

Safe Sex Education and Sex Talk

The maxim that 'sex sells' contributed to the success of Carnival advertising strategies, aimed at attracting individuals from every socio-economic status. Increased sexual energy, which accompanied Carnival celebrations, was highly anticipated. Some study participants believed Carnival could be regarded as the annual sex festival in the Caribbean. The erotic

overtones arising out of the tuneful compositions, the melodious rhythms and sensual body movements collectively acted as enabling factors for this so-called sex-fest.

Judging from stakeholder reports, authorities were actively engaged in public sensitisation on sexually transmitted infections (STIs), particularly around Carnival. Stakeholders advised that more collaborative work to develop an inter-sectoral approach to HIV prevention was needed. There was agreement among participants that recent decreases in HIV cases was indicative of public health drives; however, the problem of feminisation of HIV was yet to be adequately addressed. Participants admitted that their attitudes towards safe sex had undergone a metamorphosis over the years. More explicitly, they identified maturity; and personal research on risky sex as major game changers.

Hesitance of Caribbean couples to converse openly on their sexuality was highlighted. The crux of this silence was fear of confronting issues related to infidelity, STIs and sexual dissatisfaction. Participants neither expected their spouses to cheat nor put their lives at risk; however, they acknowledged the possibility. A few women disclosed that they were not oblivious to the realities; therefore, they often had conversations on sexual matters with their partners. Some believed that women felt that they had control over their partners' behaviour. It was debated that many women looked through rose-tinted glasses: seeing only the pleasant aspects of their relationships, while ignoring warning signs associated with infidelity or STIs.

Safe Sex Behaviours and Practices

Respondents argued that the most empowered women were no better off than women in more vulnerable positions. The conclusion was made that regardless of educational background or financial capabilities, women were all susceptible to HIV because of unwise sexual choices. For the participants, a safe sex utopia was one where women got into monogamous relationships; however, they admitted that this model was difficult to find and emulate. Alternatively, the approach of one relationship at a time was seen as a solid alternative.

In discussing past sexual decisions, generally and around Carnival, respondents claimed that in spite of their ability to take protective action, they had not been sexually responsible. Fixation on nourishing the body, and getting it physically fit, especially prior to Carnival was a plain contradiction. In the heart of heightened sexual pulls, preserving the body from life threatening diseases through risky sex was often neglected, resulting in post Carnival regrets. In addition to sex education, values, morals and personal grounding were seen as important for sex behaviour modification. In the final analysis, it was decided the true test of self-love was one's ability to protect oneself.

DISCUSSION

Feminism was recognised among Caribbean women; however, wariness over the doctrine was deeply entrenched in patriarchal influence and interference. The appraisal of and consequent leniency by professional females acknowledged the prevailing impact of triple jeopardies: 1) intergenerational miseducation on feminism; 2) androcentric cultural

indoctrination; and 3) the social construction of female identity and self-acceptance through male-female bonding. As the struggle for recognition of feminism prevails up to today, the fabrication of a new socio-political movement is still lacking.

Education and socio-economic latitude afforded to women in the patriarchal structure can have a huge impact on gender relations. Women as empowered beings have had sobering implications for the male ego. Females have had to pander to the 'fragile' image and esteem of men; some, even, have downplayed their influence to appear less intimidating as a means of securing their relationships. Professional women's inability or refusal therefore to consciously embrace equality in their partner relationships can have detrimental effects on their politics of equality; sense of self; and overall well-being.

The presentation of the female sexual self appears to be in a constant state of flux: moving from a conservative projection of self to a more unconventional identity. Passion for sex without limitations translates into a refusal to conform to previously accepted trajectories of traditional female sexuality, free of sin or fault. Simultaneously, the power of cultural restrictions imposed on women around sexual individuality cannot be denied. Women may disguise themselves by putting on masks to protect their socially fabricated fickle 'good girl image.'

The social order has successfully upheld a seemingly infallible, but falsified, image of the sexual health lifestyle of professional Caribbean women. This image has been created on the specious basis that academically accomplished women are likely exemplars of female virtue. Tertiary qualifications and intellect do not automatically imply acquisition of sex education, let alone safe sex habits. The same is applicable to women from other educational backgrounds who, may or may not, make wise safe sex choices. In reality, there is no benchmark test to determine a woman's awareness and her subsequent use of this information to protect against HIV. Knowledge and application of knowledge are distinct, and they may or may not intersect.

Carnival acted as a catalyst for removing everyday barriers. Women deliberately 'shelved' their inhibitions to be able to 'get on bad' at Carnival time. Free of gender prescriptions, women stepped out from behind the veils of piety and used their bodies in the public domain to unleash the 'bad' girl inside. This signified the extent to which sexuality or hypersexuality was repressed at other times. In the metaphorical sense, the road, on which the Carnival masquerade takes place, is her canvas for feminist consciousness, expressions of physicality and identity. Within these parameters, professional women like all other women, become unapologetically active, visible, players in the Carnival bacchanal. There are no clear lines of demarcation on behaviour of the different women at Carnival.

Quintessentially, Carnival was an aphrodisiac for the body and mind: a springboard for sexual expression. The contranormative setting with sexual innuendos provided the environment for sexual affairs, and the ability to coerce women into acting in more sexualised ways. Women who engaged in safe sex over the Carnival period without detailed knowledge of HIV contrasted sharply with the obfuscating actions of women who had the knowledge but did not practise safe sex. Involvement in unsafe practices might have been a conduit through which some women attained yet another cerebral high at Carnival. Like the femme fatale who thrives on risk taking behaviour, these Carnival lovers might have wanted to engage in thrill seeking escapades to fuel the bacchanalian women within. Unfortunately, even if these experiences resulted in mind-blowing eroticism and heavenly, bodily pleasures, there was always the prospect of sabotage to either their physical or emotional welfare.

A new version of the sexual life script of professional women has been unmasked: during Carnival, these women became inexorable 'silent players' who actively contributed to sexual misconduct of the female collective; post Carnival, they disappeared and reverted to socially prescribed behavioural norms. This secrecy and shame forced women underground whenever they deviated from traditional 'good girl behaviour.' Although the Caribbean region is far from embracing concepts such as sex-positive feminism, the sanguine hope of the research subjects was to be in a superlative position to metamorphose the way they regarded their womanhood, sexuality and sexual agency.

This study concretised the fact that, in their daily living, and as well during Carnival, professional women may be prone to error. In pursuit of happiness, they may discover pain; on a quest for euphoria, they may find danger; and in search for rebirth, they may discover death. Can a truly self-loving, mentally and emotionally sound and self-respecting woman be willing to die for sex? Professional women's silence; denial of the problem and its root causes; and refusal to call authorities to action are inimical to reducing the overall impact of the feminisation of HIV in the Caribbean. As a people, mouthing the same platitudes about privilege and empowerment to and about professional women is futile. Acknowledgement must be made of Caribbean gender politics and its obliteration of true female agency. The negative repercussions of cultural indoctrination on all women within a patriarchal system must also be given prominence. To curb the acquisition and transmission of HIV and the overall feminisation of HIV in the Caribbean- this is quintessential.

Venturing into uncharted research territory can be meritorious in its own right; however, what remains unclear is which socio-cultural factors have the greatest influence on sexual practices. With the burden of an HIV epidemic, and the economic restrictions in developing nations, it is imperative that key players prioritise which issues to concentrate on more closely through additional research. Once sufficiently understood, investment can be made in the relevant strategies to address the most critical socio-cultural issues.

CONCLUSION

The women's stories gave understandings of female sexuality, safe sex and Carnival culture in ways not described before. This study showed that sexual health education and promotion on HIV had been carried out ad nauseam; however, female complacency had set in on the problem. Education or knowledge does not necessarily influence safe sex practices. The harsh reality is that certain perilous sexual behaviours have become the norm; so much so that many women became inured to them. There are numerous commonalities among Caribbean women apropos of sexual health attitudes, behaviours and practices. In varying degrees, the socio-cultural environment influences women's individuation and sexual relationships. Society often minimalises the perceived threat of HIV to professional women. These West Indian women hold substantial socio-economic power, making them privileged on one hand, but on the other, they are vulnerable to compromised health in some of the same ways as other non-professional women. Collectively, Caribbean women are at continued risk of HIV if the necessary precautions are disregarded. Finally, findings from this project can be utilised for health programming tailored to women, as part of the wider HIV prevention strategies in the Caribbean.

ABSTRACT

The purpose of this chapter was to determine whether there is an association between pet ownership and the reported level of stress among college students. The additional variables investigated were the students' academic achievement, their age, gender and school term. To this day, most research into the probable correlation between owning a pet and an individual's stress level focused on the elderly. However, young people, especially students, can experience equally severe stress levels. Such students may be at elevated risk for poor academic performance and the onset of anxiety or depression. The method used in the study was a cross-sectional survey, conducted between June 7 and December 13 2016. Data analysis was performed using Statistical Analysis Systems (SAS) and statistical significance set at $p = 0.05$ if not stated otherwise. The measures were tested with Wilcoxon's two-tailed rank sum and Spearman's rank. 187 of 780 veterinary students completed the survey, 87% of them were female. 39% of them had at least one pet and the median self-reported stress level was 7 out of 10. Pet ownership was significantly associated with stress level ($p = 0.02$, Spearman's rank correlation -0.17), increased age and later term in school. However, there was no correlation between pet ownership or stress and gender or academic success. Additionally, the number, type and effects of pets on stress were investigated. The study affirms the negative association between pet ownership and stress among college students and thus has implications for further research in this field amid younger people.

INTRODUCTION

The role of animal companionship in stress management has gained scientific attention in recent years. Owning a dog appeared to buffer elderly people against the effects of stressful life events [1], and at least one study found dog ownership was more effective than standard drug therapy for stress-induced hypertension [2]. Likewise, dog owners were less depressed than non-owners following bereavement [3] especially if they had few or no human confidants. Some of these associations may be mediated by better self-care, including increased physical activity, among dog owners in particular [4], and/or reverse confounding, with pet owners generally healthier and younger than non-owners [5]. However, the association also exists in prospective studies: dog owners who had a heart attack were more likely to survive one year than those who did not own a dog at the time of the attack [6].

To this date most research into the association between pet ownership and stress has focused on the elderly. However, stress may be equally severe in young people. Of the ten most stressful life events according to the well-known Holmes-Rahe scale [7] none are limited to the elderly and many occur only in working-age adults (e.g., dismissal from work). High stress levels have been reported in college students for over 20 years: in 1994 a majority reported moderate to severe stress [8] and this has, if anything, increased with time [9]: in 2011 over 90% of sampled students reported average or above-average stress, and 27% reported that their stress was severe enough to cause academic problems. In addition to academic problems, stress can also cause anxiety [10] and depression [11] which in their clinical forms are among the leading causes of morbidity [12] and mortality [13] in young adults. This morbidity is likely to become worse if the stress is severe enough to interfere with performance and directly cause stressful events. Clearly college students are at risk for stress and its sequelae, and thus might benefit from stress relief interventions.

Most studies of the role of animals in stress relief among students rely on trained therapy animals, rather than the students' own pets. However, they suggest similar protective effects. College students exposed to a therapy dog reported lower stress after the encounter [14] and students' stress biomarkers were lower after exposure to a novel dog than either a human friend, or no exposure [15]. This research is convincing enough that many universities, such as Harvard [16], provide therapy dogs for stress relief. However, therapy dogs are not pets. Pets, especially dogs, often represent a significant investment of time and attention that may conflict with other priorities, while the therapeutic relationship is limited in time and space. Thus, while it is possible that pet ownership protects college students against stress in a similar manner to the use of a therapy animal, it is also possible that the benefits do not translate.

In this study, we specifically investigate whether pet-owning college students are less stressed than those who do not own pets. We also investigate whether these students are at elevated risk for poor academic performance.

OUR STUDY

After obtaining IRB approval, a cross-sectional poll was distributed to all veterinary students attending St George's University. Written informed consent was collected from all

participants. Responses were collected between June 7 and December 13, 2016. Data were collected on the following measures:

Demographics

- Age, years
- Gender (male/female)
- Term of school

Academic Performance

- GPA, categorized by quarter of a point and ranging from 0–4
- Percentage of lectures attended, categorized as follows
- Under 50%
- Over 50%
- Over 75%
- Over 90%

Pet Ownership

- Pet ownership: has at least one pet at home

Stress

- Stress, rated on a scale from 1 (lowest) to 10 (highest)

Data Analysis

All data analyses were conducted using Statistical Analysis Systems, SAS. All graphics were produced using Excel. P-value for significance was 0.05 unless otherwise stated. Because many measures were non-normally distributed, descriptive statistics are presented as N, % or median (25th and 75th percentiles) unless otherwise stated.

Each measure was tested to see if it was associated with pet ownership (using Wilcoxon's two-tailed rank sum, a nonparametric test) and/or stress (Spearman's rank). Those which were statistically significant at $p > 0.10$ were entered into a multivariable logistic regression predicting pet ownership from stress and confounders. Backwards selection took place at $p = 0.05$.

Because many studies of therapy animals use dogs, we conducted a subgroup analysis within the pet-owning group to see if those who owned one or more dogs were more or less

stressed than those who owned no dogs. We then conducted a further subgroup analysis to see if stress varied depending on the number of dogs, or the number of non-dog pets. In the pet-owning subgroup no multivariable models were run.

Table 1. Population characteristics

Trait ¹	% or median (25 th , 75 th percentile)	Associated with pet ownership P-value ²	Associated with stress Spearman's rank, (P-value)
N	187	--	--
Age	25 (24, 26)	0.001	0.03 (0.66)
Male	12.8	0.47	-0.12 (0.09)
Term of school	4 (2, 5)	0.007	0.14 (0.06)
Lives with a pet	39	--	-0.17 (0.02)
GPA ³	3.6 (3.1, 3.9)	0.60	-0.0006 (0.99)
Percent of classes attended ⁴	95 (75, 95)	0.16	-0.01 (0.84)
Stress level (1-10, ascending)	8 (7,8)	0.019	--

- N for N, % for binary measures, otherwise median (25th, 75th percentile).
- P-value from nonparametric test, Wilcoxon's two-tailed rank sum test.
- GPA reported in quarter-point increments. Average taken from the middle of each range, e.g., 3.64 was reported as "3.5 to 3.75."
- Attendance reported as "under 50%", "over 50%", "over 75%", and "90-100%. Average taken from the middle of each range, e.g., "under 50%" was recorded as 25%.

All measures are self-reported.

FINDINGS

Of 780 students who attended the vet school, 187 (24%) completed the survey. 87% were female. Median age was 25 years (25th and 75th percentiles 24 and 26). The median subject was in the 4th term out of 5 (2,) and reported a GPA of 3.6 (3.1, 3.9).

39% of students, N = 73, had at least one pet living with them on Grenada. Pet ownership was significantly associated with increased age ($p = 0.0001$) and with later term in school ($p = 0.007$) in addition to stress ($p = 0.02$). However, it was not associated with gender, GPA, or class attendance (all $p > 0.10$).

Stress

Median self-reported stress was 7 out of 10, and most students reported their stress as being 7 or 8 (25th and 75th percentiles 7, 8). Students who reported higher stress were less likely to report owning pets, with a clear trend visible (figures 1 and 2). This association persisted in statistical models: stress was significantly associated with pet ownership ($p = 0.02$, Spearman's rank correlation -0.17). It was also associated borderline significantly with term of school ($p = 0.06$, rank correlation 0.14). Males were nonsignificantly less stressed

than females ($p = 0.09$). However, there was no association between stress and either age, GPA, or school attendance (all $p > 0.50$).

Figure 1. Less pet ownership among stressed university students.

Figure 2. Lower stress levels in students with pets.

Number, Type and Effect of Pets on Stress

Among students with any pets, the median number of pets was 1 (75th percentile, 2; see table 2). 58% owned one or more dogs, and 41% owned one or more other animals. Within pet owners there was no association between stress and either species or number of pets (all $p > 0.5$). Almost all (93%) of pet owners reported that their pet decreased their stress, while only one (1.5%) reported that the pet increased their stress.

Table 2. Profile of pet owners

Trait ¹		Associated with stress (Spearman's rank, p-value)
N	73	--
Male		
Total number of animals	1 (1, 2)	0.04 (0.77)
Any dogs	58 (79%)	0.17 (0.16)
Number of dogs, among those with any	1 (1,1)	0.03 (0.78)
Any other animals	30 (41%)	-0.04 (0.75)
Number of other animals, among those with any	1 (1, 2)	-0.03 (0.79)
Effect of pet on stress levels		
Increase	1 (1.5%)	-0.04 (0.72)
No change	4 (5.8%)	0.02 (0.89)
Decrease	64 (93%)	-0.04 (0.74)
(missing data)	4 (5.8%)	--

- 39% of subjects (N = 73) had pets living with them.
 - N for N, % for binary measures, otherwise median (25th, 75th percentile).
 - P for difference from nonparametric tests (Wilcoxon's two-tailed rank-sum test).
 - GPA reported in quarter-point increments. Average taken from the middle of each range: e.g., 3.64 was reported as "3.5 to 3.75."
 - P for global null.
- All measures are self-reported.

Corrected Association between Pet Ownership and Stress

In the raw data, each one-point increase in stress was associated with about a 23% reduction in the odds of having a pet (odds ratio 0.767, $p = 0.005$). However, students in later terms of school were both more stressed and more likely to own pets, so the association got stronger after correction for term. In corrected models the odds ratio dropped to 0.746 ($p = 0.0003$, see table 3). After correction for term, age was not independently associated with pet ownership.

Table 3. Correlates of pet ownership

Predictor	Odds ratio	95% confidence interval	P-value
Age	(removed)	--	--
Term of school (from 1 to 5)	1.333	1.10 – 1.61	0.003
Stress (from 1 to 10)	0.746	0.62 – 0.91	0.003

DISCUSSION

This study confirms the known negative associations [1, 2] between pet ownership and stress and extends these associations to college students. It also appears that resources invested in a pet did not interfere with academic success, since pet ownership was not associated with either GPA or class attendance.

Previous research into the association between animal companionship and stress has suggested that dogs are the most beneficial [1] and therapeutic interventions also tend to focus on dogs. However, other animals may be equally beneficial: we found no association between stress and either species or number of pets. We encourage future researchers with greater statistical power to replicate this part of our study.

This study has three major limitations, of which the largest is a complete reliance on self-reported data. Social desirability bias may have led subjects to report higher GPAs or more class attendance than was in fact the case. However, the bias may be nondifferential with respect to pet ownership, and perceived stress is necessarily self-reported.

Similarly, selection bias almost certainly took place. The survey was distributed through the university's Facebook page and thus may have oversampled those who were more engaged in their education. 87% of sampled subjects were female compared to only 81% of the veterinary school, and almost all reported good grades and low absenteeism (25th percentiles for GPA and attendance were 3.1 and 75% respectively). Reported pet ownership was also relatively low-intensity, with most pet owners reporting only a single animal, and thus pet-induced stress may not have been sufficient to interfere with academic performance. Care should be taken when applying our findings to poor students, those with limited resources, or those with large numbers of pets.

Lastly, reverse causation is a concern. Our data are consistent with a protective effect of pets on stress, but also with a lower rate of pet acquisition among people with high stress levels, with pet-friendly environments being less stress-inducing, or with a non-causal relationship. No cross-sectional study can address this issue, and a controlled trial of pet ownership is unlikely, but a longitudinal study would help to establish the existence and direction of causation.

ABSTRACT

Antimicrobials are considered the foundation of modern medicine facilitating exponential improvements in patient care. Antimicrobial resistance (AMR) is defined as “the loss of effectiveness of antimicrobial agents upon pathogenic microbes” caused by inappropriate use of antimicrobials. AMR is an ever-growing problem recognized as one of the greatest public health threats worldwide.

Objectives: To identify variation in adherence to antimicrobial standards among the Winchester and Basingstoke hospitals within the Hampshire Hospitals NHS Foundation Trust (HHFT). Study group: Electronic records of all patients on antimicrobials within the HHFT between April 8th and May 10th, 2019.

Methods: This cross-sectional point prevalence study reviewed antimicrobial prescriptions using the HHFT's Electronic Patient Records (EPR), e-prescribing system (JAC) and medical notes against Public Health England's audit standards.

* Corresponding Author's Email: kleeapin@sgu.edu.

Results: Out of 660 patients, 213/215 (99%) patients on antimicrobials were reviewed. Clinical indications were documented in 86% of cases with appropriate samples taken in 75% of cases. There was a significant difference between documented indication for antimicrobial ($p = 0.046$) and taking of appropriate sample for antibiogram before initiation of antimicrobial ($p = 0.047$) between the two hospitals within the Trust.

Conclusion: Improvements across HHFT are required in order to improve the quality and standard of prescribing practices to decrease AMR. Additional research is needed on appropriate step-down plans and stop dates agreed on for each prescription.

INTRODUCTION

Antimicrobials have been proven to be extremely important developments in medicine. They are considered to be the foundation of modern medicine which has facilitated exponential improvements in patient care [1, 2]. Antimicrobial resistance (AMR) is defined as “the loss of effectiveness of antimicrobial agents upon pathogenic microbes”. AMR is not a new phenomenon [3, 4], yet there is currently no systematic surveillance systems in place to monitor AMR [5]. It has become an ever-growing problem and is recognized as one of the greatest threats to human health worldwide, both in the present and in the coming decades [1, 6, 7].

Within the last decade, there has been a dramatic increase in the proportion and number of bacterial pathogens that are resistant to multiple antibacterial agents and especially regarding resistance to quinolones, carbapenems and third-generation cephalosporins. This is driven by inappropriate prescribing, over-the-counter availability and self-medication, which reflects a general lack of awareness on the global threat that AMR poses to society [8]. Antibiotic prescription in primary care settings has been shown to directly affect AMR [9]. During the period 2010 to 2014, most antimicrobial prescribing in the UK occurred in general practice. In 2014 specifically, 74% of antimicrobial prescribing occurred in general practice, 11% for hospital inpatients, 7% for outpatients, 5% for patients seen in dental practices and 3% in other community settings [9]. Resistance is primarily driven by the use of antimicrobial agents [3] used in a variety of settings such as hospitals, out-patient clinics, long-term care facilities as well as in animal-associated settings like veterinary clinics, farms and feedlots [10].

In addition, there is also growing resistance to even second and third-line forms of treatment making it difficult to treat these diseases. One example is *Klebsiella pneumoniae* which is rapidly becoming untreatable using last-line antibiotics. This is especially problematic in hospitals where it causes a range of acute infections [11] and it is compounded by the burden of resistant hospital-acquired infections (HAIs).

THE DWINDLING PIPELINE OF ANTIMICROBIAL AGENTS

Not only is the problem of AMR increasing but over the last 30 years, antimicrobial drug development has slowed having a compounding effect [9]. In response to the growing penicillin resistance, new beta-lactam antibiotics were developed which restored confidence in antibiotics but this was short-lived as the first case of methicillin-resistant *Staphylococcus*

aureus (MRSA) was identified in the same decade, first in the UK in 1962, and then in the US in 1968 [12, 13].

In the initial periods of the discovery of antimicrobials, drug development occurred at a relatively fast rate with twenty new classes of drugs making it to the market between 1930 and 1962 [5]. This meant that when resistance developed, a new drug was simply created to treat the increasingly resistant bacteria [9, 14]. After the 1960s there were only three completely new classes of drugs that were approved [5] and since 1998, only 10 new antibiotics have been approved and only two of these (linezolid and daptomycin) have new targets of action [9].

AMR WITHIN THE HOSPITAL

Even though a fair amount of antimicrobial usage occurs in communities, the intensity of use is higher in hospitals, therefore hospitals are particularly important in the containment of AMR [3]. It is estimated that up to 50% of antibiotic orders in hospitals are unnecessary or inappropriate and this is the setting where the broadest of spectrum agents are rampantly being used [15, 16].

This cross-sectional point prevalence study explored existing variation in adherence to antimicrobial prescription standards within the HHFT. We hypothesized that there would be variation in antimicrobial prescribing standards among the wards within each hospital as well as between both Royal Hampshire County Hospital (RHCH) and Basingstoke and North Hampshire Hospital (BNHH), two hospitals within the Trust.

OUR STUDY

A prospective chart review was conducted for adult patients that were admitted to the Royal Hampshire County Hospital [RHCH] and Basingstoke and North Hampshire Hospital [BNHH], hospitals within the Hampshire Hospitals National Health Service [NHS] Foundation Trust (HHFT). Approval for this study was obtained from the HHFT. Data were collected from the HHFT's Electronic Patient Records (EPR) and were anonymized regarding both patients and practitioners. A single auditor prospectively reviewed all patients on new prescriptions of antimicrobials between April 8th to May 10th, 2019. Data was obtained from the following wards: acute and medical; critical care (intensive care unit [ICU] and high dependency unit [HDU]); surgical; orthopedic; and maternity.

Inclusion Criteria

The study included all adult patients on the selected wards who were prescribed new antimicrobial agents (antibiotics, antifungals and antivirals) on their current admission.

Exclusion Criteria

Pediatric patients, patients who were admitted and were already on antimicrobials, patients admitted only for same-day surgery, and patients seen at the Accident and Emergency Department were excluded from the study. Patients who were prescribed antiretrovirals or antimicrobials for surgical or medical prophylaxis, patients who were prescribed any topicals medication, and patients who were prescribed any anti-parasitic medication, were also excluded.

The auditor accessed the EPR system, medical notes, and the electronic prescribing system, JAC. The number of patients on antimicrobials was recorded as well as the number of patients' notes seen and evaluated. Antimicrobial prescriptions and practices were reviewed against the following audit standards:

- 100% of antimicrobial prescriptions have the clinical indication documented.
- 100% of cases have appropriate samples (sputum sample, MSU, wound swab, blood cultures etc.) taken before initiating antimicrobial treatment in order to provide targeted antimicrobial therapy.
- 100% of antimicrobial prescriptions that are greater than 72 hours have been reviewed.
- 100% of intravenous (IV) antimicrobial prescriptions that are suitable for the therapeutic switch to an oral alternative are appropriately stepped down (criteria as per 'IV to oral switch therapy' guidance as per MicroGuide™).
- 100% of antimicrobial prescriptions follow the Trust's antimicrobial prescribing guidelines or are according to documented specialist advice.

Antimicrobial prescriptions exceeding 72 hours comprised of a documented collaboration between a microbiology consultant, an infectious disease specialist, an antimicrobial pharmacist, or documentation of "continue antimicrobial/ antibiotic plan". Patient notes that were documented as "continue the plan" was considered as an inadequate review. Step-down treatment that was documented in patient notes but was not documented in the electronic prescribing system was considered as "not documented."

Data Analysis

The information collected from the patients' EPR was compiled and summarized according to the categories established for this study. Chi-square tests and Fisher's Exact tests were used to examine if there was a significant association between adherence to Trust guidelines, documented indication for antimicrobial treatment, and other factors relating to antimicrobial prescription practices, by hospital sites and wards among the total sample. Trust guidelines followed were categorized as: yes, no, off guideline but justified, guideline unavailable, and treatment unknown. For Table 1, trust guideline followed were further classified as yes, no and other. For Table 2 and Figure 2, analysis was done only if trust guidelines followed were documented as yes and no. Statistical significance was reported at

an alpha level of 0.05. All data were analyzed with SPSS statistical software package, version 24 (Armonk, NY).

Figure 1. Audit standards tested across RHCH and BHNN hospitals within HHFT.

FINDINGS

Our sample included a total of 660 patients on thirty-seven selected wards in RHCH and BNHH; 215 (33%) were on antimicrobials, of which 213 (99%) had medical notes available to enable quantification of antimicrobial prescription management indicators. Of the 213 patients on antimicrobials, 183 (85.9%) had a clinical indication documented. Appropriate samples were taken in 160 (74.4%) patients. There were 142 (66.7%) patients who had an antimicrobial prescription for longer than 72 hours. Of those who had an antimicrobial prescription for longer than 72 hours, a review had been documented within 72 hours for 120 patients (84.5%). There were 106 (49.8%) patients who had oral prescriptions and 107 (50.2%) who had IV prescriptions. Those who had IV prescriptions, 50 (46.7%) of them were prescribed for more than 48 hours. There were 38 patients (17.4%) who had an appropriate step-down plan. Trust guidelines were followed in 156 (71.6%) patients, 13 (6%) cases did not follow Trust guidelines, (73%), the indication was unknown in 21 (9.6%) cases, treatments were off-guideline but justified in 21 (9.6%) cases, and there were no guidelines available in 2 (0.9%) of cases. Detailed descriptions are found in Figure 1.

Categorical analysis showed that there was a discrepancy in prescription practices between the two hospital sites regarding type of antimicrobial prescribed ($p < 0.001$), documented indication for antimicrobial use ($p = 0.046$) and taking of appropriate sample for antibiogram before initiation of antimicrobial ($p = 0.047$). Details are shown in Table 1 and Figure 2.

Figure 2. Percentage of AM indication that was documented according to hospital and ward.

Table 1. Antimicrobial (AM) prescription and practices according to hospital sites

Variables	BNHH	RHCH	Values

Figure 3. Percentage of Trust guidelines followed according to hospital and ward.

DISCUSSION

The results confirmed the hypothesis that antimicrobial prescribing practices did differ among the wards within each hospital and across hospital sites within the HHFT. The results were slightly better at RHCH than BNHH across all audit standards tested. This showed a level of inconsistency regarding antimicrobial prescribing practices between both hospital sites within the HHFT. This difference in practice raises a concern about the need for systematic approaches to ensure adherence to established guidelines in all hospitals within the HHFT. The results show there is room for improvement specifically for BNHH to reach the same level of prescribing practices as RHCH.

While the majority of cases reviewed were in compliance with HHFT guidelines, over one-quarter of these demonstrated some issue. In 7% of the cases, guidelines were either absent or not followed. While there was no statistical difference regarding adherence to Trust guidelines, this non-compliance is not the best evidence-based practice regarding prescribing antimicrobials.

The above non-compliance represents 13 patients over the sample size of 213 patients. The results of this study show that 32.6% of patients reviewed were on antimicrobials. This is in accordance with WHO suggestion that up to 30% of all hospital inpatients should be on antimicrobials at any one time.

The results show that in all aspects reviewed medical wards tended to have better overall prescribing practices compared to the surgical wards. The critical care wards had a higher percentage of patients on IVs longer than 48 hours, but this is expected based on the typical patient profiles on these wards. The critical care wards also had less plans for stepping down treatment but again this is understandable given the more severe nature of the patients' condition on these wards.

RECOMMENDATIONS

It is vital to have the clinical indication documented in the patients' notes so that all members of the team can be aware of what the patient is being treated for. It was interesting to note that in all 15 cases where a clinical indication was not recorded, reviews for those cases were also not done. Having indications documented will encourage reviews to take place.

Taking appropriate samples is important in making or confirming a correct diagnosis to be able to narrow and target treatment accordingly based on sensitivities.

It is important to ensure that patients are not unnecessarily on long courses of IV treatments. There are risks to being on extended IV treatments such as the risk of line infections and thrombophlebitis. In addition, it is more expensive to treat patients with IV treatments than oral equivalents when they are medically stable enough to use oral forms.

Having stop dates included in the online prescribing system can facilitate the assessment of whether course length planning is being actively considered. Appropriate step-down planning was difficult to measure in this study so it may be more helpful to have stop dates put in place for future studies. Having hard stop dates may however pose problems in cases where patients with more serious infections may require a longer duration of treatment.

Having to renew prescriptions based on stop dates may prove onerous to clinicians and can lead to human errors. On the other hand, if clinicians are forced to continuously review prescriptions, this may lead to better prescribing practices and improved antimicrobial stewardship. This topic is recommended for further discussion and consideration outside the scope of this paper.

Professor Dame Sally Davies, Chief Medical Officer of England said “Antimicrobial resistance poses a catastrophic threat. If we do not act now, any one of us could go into hospital in 20 years for minor surgery and die because of an ordinary infection that cannot be treated by antibiotics” [9]. The WHO shares this sentiment as they claim that “A post-antibiotic era — in which common infections and minor injuries can kill — far from being an apocalyptic fantasy, is instead a very real possibility for the 21st century” [17]. India has reported a prevalence of 41% with methicillin resistant *Staphylococcus aureus* (MRSA) and additional high prevalence of Gram-negative bacterial resistance [18]. The WHO has estimated that worldwide there are 3.7% of new cases and 20% of previously treated cases are estimated to have multidrug resistant TB [18].

In 2013, the Centers for Disease Control and Prevention (CDC) estimated that over two million Americans develop hospital-acquired infections (HAIs) as they are infected with antibiotic-resistant infections each year [19, 20]. Methicillin-resistant *Staphylococcus aureus* (MRSA) alone kills more Americans annually than emphysema, HIV/AIDS, Parkinson’s disease and homicide combined [21, 20]. In 2006, two common HAIs alone (sepsis and pneumonia) were responsible for almost 50,000.

American deaths and cost the US health care system over \$8 billion. In 2007, annual deaths due to these infections accounted for 23,000 and 25,000 deaths respectively in the European Union and the United States [6, 15, 22, 23, 19]. In India, there are 58,000 deaths per annum due to drug-resistant infections [5]. Currently, it is estimated that there are 700,000 deaths globally each year due to AMR [7]. Without policies in place to stop the worrying spread of AMR, this number is predicted to rise to a disturbing 10 million deaths per year, more than cancer and diabetes combined [7]. The CDC suggested that the world was losing the battle on AMR when it stated in 2013 that the human race is now in the “post-antibiotic era” [19]. A year later, the WHO also warned that the AMR crisis is becoming dire [17].

In order to solve this paradoxical problem of resistance, public education and awareness is critical as this is a major contributing factor to AMR. In addition, a much higher degree of precision is required in antimicrobial stewardship and more prudence needs to be exercised in prescribing practices.

Antimicrobial stewardship is a broad term used to encompass appropriate selection, dosing, route of administration and duration of antimicrobial treatment [16]. It has been described as “the optimal selection, dosage, and duration of antimicrobial treatment that results in the best clinical outcome for the treatment or prevention of infection, with minimal toxicity to the patient and minimal impact on subsequent resistance” [24].

Through stewardship programs, one can ensure that the limited agents we have available are put to optimum use with the utmost discretion across all settings including the hospital and wider community. These programs have significantly reduced the incidence of infections and colonization with antibiotic-resistant bacteria and *C. difficile* infections in hospital inpatients [25].

There are many ways to tackle AMR. One incredibly important recommendation is to have a significant increase in surveillance to track resistance, especially in the emerging

world [7]. The UK government has taken on this task and initiated the Fleming Fund providing 375 million USD to improve disease surveillance focused on drug-resistant infections in low and middle-income countries [1, 7].

It is also recommended that more funding be allocated to research into new antimicrobials and improved diagnostic tests [7]. Both the UK and Chinese governments have taken the initiative to achieve this recommendation by each contributing 50 million GBP (72 million USD) to a new Global Innovation Fund [7].

AMR requires a One Health approach as it is recognized that human, animal and environmental health are all inextricably linked through the use of antimicrobials. The widespread use of antimicrobial agents in animals and the food chain contribute a significant source of AMR. This One Health approach is necessary to develop comprehensive and integrative measures to address AMR and should include whole-genome sequencing surveillance of pathogens in humans, animals and the environment to developing a better understanding of AMR [2].

LIMITATIONS

An important limitation was the appropriateness of the diagnosis given to each patient. This audit was testing whether the chosen antimicrobials were appropriate for the given clinical indication assuming the diagnosis made was correct.

It was not established whether IV prescriptions were given as a result of no oral options being available.

Assessing whether an appropriate step-down plan was established proved difficult as the auditor's access was restricted to the online prescribing system, JAC, for all previous prescriptions the patient was on for their current admission. The current prescriptions the patient was on may not have been reflective of their initial prescriptions and therefore it may have been missed if their treatment was stepped down.

It was difficult to ascertain whether a prescription was off-guideline justified vs off-guideline not justified particularly when the auditor was not a member of the team on the ward and they did not know the patient.

CONCLUSION

According to the WHO guidelines, no more than 30% of hospital patients at any given time should be on antimicrobials. This study indicated that some 32% of the sample size was on antimicrobials and therefore underscores the fact that hospitals do play a big role in antimicrobial stewardship and the global AMR challenge. It is therefore imperative that guidelines are clearly articulated and followed by all institutions within a Trust.

Based on the results of the study, there is an overall need for improvement in both hospital sites with regards to documenting indications, taking appropriate samples and having better reviews conducted and documented. In addition, proper planning of stepping down treatment from IV to oral should be made, clear stop dates should be agreed upon and improvements made in the following of Trust guidelines.

If all these criteria are improved on, prudent antimicrobial prescribing practices can be improved. This will enhance overall clinical outcomes for patients while impacting the wider community by helping to curb the growing problem of AMR.

ACKNOWLEDGMENTS

We would like to acknowledge Hayden Nanton for his editorial contribution and invaluable assistance. The authors have stated all possible conflicts of interest within this work. The authors have stated all sources of funding for this work. If this work involved human participants, informed consent was received from each individual. If this work involved human participants, it was conducted in accordance with the 1964 Declaration of Helsinki. Chapter 79

ALCOHOL CONSUMPTION AND SELF-REPORTED VIOLENCE AMONG SECONDARY SCHOOL AGED CHILDREN (12-16 YEARS) IN 14 CARIBBEAN COUNTRIES: A CROSS SECTIONAL STUDY

Gerard St. Cyr*, MSci, MPH, BSci

Department of Public Health and Preventive Medicine,
St. George's University School of Medicine, St. George's University, True Blue, Grenada

ABSTRACT

Cross sectional study using secondary data analysis from the Global School-based Student Health Survey (GSHS) examining the relationship between alcohol consumption and violence among adolescents in 14 countries across the Caribbean region. Objectives: To determine (i) the association between alcohol consumption and violence and (ii) to identify the predictors of alcohol use and violence among Caribbean adolescents. Study Group: 22,525 (44.6% boys and 53.4% girls) adolescent students (12-16 years), were sampled using two stage sampling design, from Secondary schools across the Caribbean. Methods: Logistic regressions to obtain crude odds ratios between alcohol use and three forms of violence. Likelihood ratios tests for variables identified as potential confounders were conducted to determine which variables should be included in the final model. Further analyses using logistic regression to determine the predictors of violence included the primary exposure (alcohol) and confounding variables. Results: Alcohol consumption was (i) associated victims of violence, OR = 1.47, CI: (1.37-1.58), $p < 0.0001$, (ii) associated with those who instigated or participated in physical fights, OR = 1.92, CI: (1.77-2.09), $p < 0.0001$ and (iii) associated with self-directed violence, OR = 0.49, CI: (0.44-0.55), $p < 0.0001$. The predictors of violence are (i) cigarettes use, (ii) other drugs, (iii) insomnia and (iv) parental involvement. Conclusions: This study confirms what has been found in European and North American cultures where alcohol consumption is positively associated with violence among adolescents. Further, there are demographic, psychological, and environmental factors that may also influence adolescent alcohol use and violent behaviors.

INTRODUCTION

Alcohol use among adolescents represents a major global public health concern due to its immediate and long term physical and mental health effects [1]. Reasons for drinking are complex and many factors contribute to this behavior. Previous research has established links between personality factors and alcohol consumption and between metacognitions (one's ability to understand, control and manipulate his/her thinking) [1].

There are three main direct mechanisms of harm caused by alcohol consumption in an individual: (i) toxic effects on organs and tissues, (ii) intoxication that leads to impairment of physical coordination, consciousness, cognition, perception, and behavior and (iii) dependence, loss of self-control on drinking behavior [2]. Even when consumed in small amounts, alcohol use has a number of consequences, such as risky sexual behaviours, juvenile delinquency, conflicts with friends, familial conflicts, elevated suicidal rates, illicit drug use, violence and many more [3]. Some of these risks associated with alcohol consumption by adolescents may be immediate, for example, road traffic accidents, and injuries from sports and drowning or long term such as development of substance use disorders: tobacco, cannabis and stimulants [3].

The drinking patterns of people in different age groups are difficult to compare internationally because different age groupings and varying measures of alcohol consumption used in different countries [4]. Ahlstrom study reports that most surveys that compare drinking in various age groups were conducted in established market economies of Europe and North America, and not in developing regions. However, gender and age have emerged from these studies as important factors that affect drinking behaviours [4]. In almost every society, young adult males drink more frequently than young adult females whereas during adolescence the drinking patterns are less differentiated by gender. This convergence is especially obvious in Nordic countries, Ireland, United Kingdom and United States [4]. In the Caribbean this differentiation by gender for alcohol consumption among adolescents is not known.

A study on alcohol consumption among adolescents reports that in Australia 19.2% consumed one or more drinks within the previous three months, in Portugal approximately 50% experimented (first time drink only) with it [5]. This study further reports that studies carried out in Brazil claims that the prevalence values of alcohol experimentation ranges from 48.3% to 71.4% in adolescence at some time in life in addition to an 8.9% frequency of heavy use [5]. Another study on Caribbean-Americans adolescents found that they drank more frequently, became drunk more often, consumed more per drinking occasion, and planned to drink more in the future than African-American adolescents [6]. However, these studies did not determine the predictors of alcohol use for these groups.

In addition, parental alcohol use is thought to be a strong predictor of alcohol use among adolescents [6]. Other research also shows that peers and friends play a significant role in influencing teenagers to drink [7]. This supports the notion that observation of a particular behaviour by significant others, leads to the imitation of that behaviour and once started, the original models reinforce the behaviour. This social learning process of behaviour through observation, modelling, imitation and reinforcement influences alcohol use among adolescents [6].

It can be argued, that generally the social learning process is universal, whereas the specific social influences to consume alcohol may depend on culture or ethnicity [6, 7]. Therefore, to accurately assess which social characteristic influences one to drink, studies must include a complete range of these influences among different groups in different regions. According to Epstein et al. [6] and Behaviour Theory, alcohol use results from an interaction of personal, physiological, genetic, and environmental factors. The theory proposes that some adolescents find deviant behavior such as drinking and smoking, functional because it helps them to achieve personal goals. This is a gap in our knowledge that must be filled through scientific investigations [6].

Exposure to violence and traumatic stressors among children and adolescents has both short and long term effects on multiple health behaviours, for example, smoking, substance abuse and physical inactivity [8]. In addition to the effects on multiple health behaviours, there are negative health outcomes later, in life such as higher prevalence of heart, lung and liver disease, diabetes and depression [8]. Moreover, the exposures (alcohol and peer to peer violence) appears to influence health behaviours and outcomes through a cumulative process affecting the liver and the nervous system [3, 8].

Several studies have found a relationship between alcohol consumption and interpersonal violence including individual and group fighting, hand gun use, violent attacks, intimate partner violence, forcible rape and homicide. Therefore, adolescents experiencing violence, particularly peer to peer violence is common [8]. Further, evidence from prospective studies indicate that alcohol use during adolescence increases the risk for violence during that period and into adulthood [9]. Most recently in 2012, a study using the Global School-based Student Health Survey (GSHS) data for Argentina found that both male and female adolescent's drinkers were significantly more likely to engage in violence when compared to their non-drinking classmates [1].

The GSHS survey investigates the health and risk behaviours of middle school students living in low and middle-income countries across the world. Participating countries use the results from GSHS to identify public health policies and interventions that will improve the health of adolescents. Its purpose is to provide data on health behaviors and protective factors among students to (i) help countries develop priorities, establish programs, and advocate for resources for school health and youth health programs and policies (ii) allow international agencies, countries and others to make comparisons regarding the prevalence of health behaviours and protective factors and (iii) establish trends in the prevalence of health behaviours and protective factors [10, 11].

Currently, there are no studies that have looked at this relationship in the Caribbean. As a result an understanding of the risk factors associated with early exposure to alcohol and its association with violence among adolescence in the Caribbean is needed. This will contribute to the development and or refinement of intervention programs aimed at reducing alcohol use and violence among Caribbean adolescents.

Therefore, this study hypothesizes that Caribbean adolescents who drink alcohol are involved in a significantly higher frequency of violent activities because research has shown that alcohol affects judgment, behavior and the expression of emotions.

As a result the purpose of this study is to determine the association between self-reported violence (primary outcome) and alcohol consumption (primary exposure) among adolescents in the Caribbean. In addition the predictors of alcohol use will also be determined in an effort to guide interventions aimed at reducing alcohol use and violence among adolescents. To

achieve this, this study will be guided by the following objectives: (i) To determine the association between alcohol consumption and violence among Caribbean adolescents and (ii) to identify the demographic, environmental and psychological predictors of alcohol use and violence among Caribbean adolescents. To achieve this the following questions will be answered:

The findings of this study will set the foundation upon which further studies can build increasing our knowledge and understanding of alcohol use and participation in violent activities. Further, the results of this study will provide evidence that justifies the need for interventions aimed at reducing alcohol intake and violence among teenagers in the Caribbean.

OUR STUDY

Cross Sectional Study using secondary data from the Global School-based Student Health Survey (GSHS) examining the relationship between alcohol consumption and violence among adolescents in 14 countries across the Caribbean region. The methods used in the survey have been described elsewhere in detail [10-12].

Setting

The Caribbean is a region of the Americas with a population of approximately 44 million and consisting of islands from the Bahamas and Cuba in the north to Trinidad and Tobago in the south. Some islands are surrounded entirely by the Caribbean Sea and others are bordering with both the Caribbean Sea and the North Atlantic Ocean. This study uses data from 14 Caribbean English speaking countries.

Participants

Twenty two thousand five hundred and twenty five adolescent students (12-17 years), comprising of 44.6% boys and 53.4% girls was sampled from secondary schools across the Caribbean. The GSHS used a standardized scientific 2-stage sampling design. Stratum reflects the first level of the GSHS sample selection process, that is, schools. Stratum is assigned sequentially starting with the school with the largest enrolment of students in the grades/sections/levels/forms that 12-17 year olds usually attend and continuing through the list to the school with the smallest enrolment [10, 11]. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate. Students enrolled in the sampled classes were invited to complete an anonymous self-reported questionnaire during school hours [10, 11].

Data Collection Procedures

The GSHS is a school based self-administered survey primarily for students 12-17 years. This survey included core questionnaire modules, core expanded questions, and country specific questions that are combined to form a questionnaire which can be administered during one regular class period [1, 9]. The core questionnaire modules address the leading causes of morbidity and mortality among children adolescents worldwide [1]. These include three items on demographics (age, gender and current class grade), six items on alcohol use including age of first exposure, seven items on dietary behaviours, four items on drug use including age of first exposure, four items on hygiene, six items on mental health including feelings of loneliness, four items on physical activity including number of days student attended physical activity classes within school year, six items on protective factors for example missing classes without permission, five items on sexual behaviours that contribute to HIV infection, other sexually transmitted infections, and unintended pregnancy, six items on tobacco use and seven items on violence and unintentional injury. Participating countries must include at least six of the 10 core modules with no changes in the questions [1, 10]. Core-expanded questions are used to collect more detailed information on selected core questionnaire module topics. Core-expanded questions measure behaviors, knowledge, attitudes, skills, access to resources or information, or module-specific protective factors. These questions share the same format characteristics as the core questionnaire modules and is not available for public use. The data use for this analysis comes from the public-use data files. CDC (Center for Disease Control and Prevention) serves as the Data Coordination Center. All data processing (scanning, cleaning, editing, and weighting) is conducted at CDC [10, 12].

Data Analysis

Alcoholic drinkers are defined as participants reporting consumption of one or more alcoholic beverages in the previous month. This was recoded to a dichotomous scale of drinkers and non-drinkers. In the GSHS violence is measured with three questions about the previous year: (i) being the victim of violence (being physically attacked) (ii) instigating or participating in violence against others (being in a physical fight), and (iii) self- directed violence (whether student had seriously considered suicide). These were all recoded to a dichotomous scale.

Data analysis accounted for clustering by country using country as a fixed term in analyses. Crude Prevalence estimates and estimates by country were obtained for alcohol consumption, and the three forms of violence. Chi-square test of independence between all three forms of violence were performed.

Logistic regressions indicating which factors are associated with both alcohol (main exposure) and the three forms of violence determined which ones were confounding factors. Factors assessed were age, gender, feeling of loneliness (mental health), insomnia producing anxiety, cigarettes use, parental involvement (parents checking homework, parent's knowledge of their adolescent whereabouts, parents understanding of their adolescent), physical activity, skipping school without permission, and having no close friend. Likelihood

ratio test was done to determine whether or not age and gender were modifying the effect of alcohol on violence.

The final model included variables identified as potential confounders (associated with both alcohol and violence) to obtain the adjusted association between alcohol use and the three forms of violence. Analyses were performed using STATA 14. All p-values lower than 0.05 showed evidence against the null hypothesis of no association between exposure(s) and the outcome.

FINDINGS

The study population consisted of 46.6% males and 53.4% females with an age range of 11 to 16 years categorized into the following age groups: 11-12 year olds 12.0%, 13 year olds 23.2%, 14 year olds 27.9%, 15 year olds 23.3% and 16 year olds 3.6% (see Table 2).

Alcohol consumption (main exposure) had a crude prevalence of 43.8%, 95% CI: (43.1%- 44.5%), and showing a steady increase from the youngest age group to the oldest. 10 of the 14 participating countries had a prevalence >40 (see Table 3).

Table 2 shows the crude prevalence for the three forms of violence: (i) Victims of violence: 37.6%, 95% CI: (36.9 -38.3), (ii) Participated in physical fights: 39.4%, 95% CI: (38.8- 40.1), (iii) Serious thoughts of suicide (self-directed violence): 79.1%, 95% CI: (78.6 – 79.7).

Table 2. Age distribution of participants by country (n = 22,382)

Country	Age groups				
	11-12 years % (n)	13 years % (n)	14 years % (n)	15 years % (n)	16 years % (n)
Anguilla	13.6 (129)	19.5 (185)	22.18 (210)	19.3 (183)	25.3 (240)

St. Vincent	13.0 (170)	31.6 (414)	29.4(385)	17.6 (230)	8.4 (110)
Trinidad & Tobago	24.4 (682)	23.0 (641)	23.9 (668)	18.9 (527)	9.8 (273)
Total % in sample	12.0 (2676)	23.2 (5194)	27.9 (6261)	23.3 (5204)	13.6 (3047)

Linear Trends

Likelihood Ratio Tests (LRT) for linear trends between alcohol consumption and age ($p = 0.0004$) confirmed that a linear trend exists between alcohol consumption and age showing that there was an increase in alcohol consumption as age increased.

LRT for linear trends (evidence decline) between age and violence provided evidence against the null that there was no linear trend between (i) Victims of violence and age $p = 0.0113$, (ii) instigators and those who participated in fights $p = 0.014$.

LRT test for trend between Self-directed violence and age did not find evidence against the null of no linear trend $p = 0.3430$.

Table 3. Chi Square test of independence between different types of violence

Victim of Bullying	Instigating or participating in physical fights (n)%		Total (n)%	Probability of Chi Square
No	No 10, 447 (80.9)	Yes 2,914 (34.4)	13,361 (62.5)	<0.001
Yes	2,468 (19.1)	5,557 (65.6)	8,025 (37.5)	
Total % (n)	12,915 (100)	8,471 (100)	21,386 (100)

No	No1,999 (50.1)	Yes10,077 (65.5)	12,076 (62.3)	
Yes	1,994 (49.9)	5,301 (34.5)	7,295 (37.7)	
Total % (n)	3,993 (100)	15,378 (100)	19,371 (100)	
Self-directed Violence	Instigating or participating in physical fights (n) %			<0.001
No	No 2,110 (17.7)	Yes 1,940 (25.4)	4,050 (20.7)	
Yes	9,815 (82.3)	5,688 (74.6)	15,503 (79.3)	
Total % (n)	11,925 (100)	7,628 (100)	19,553 (100)	

Factors Associated with Alcohol Use

Environmental and psychological factors associated with alcohol use were: gender (male), loneliness, insomnia, cigarettes use, the use of other drugs, parental involvement, victims of bullying, physical activity on less than two days in past week, skipping school and having no close friend (see Table 4).

Factors Associated with Violence

- *Alcohol*: Crude association showing odds ratios (OR, 95% CI) adjusted for country between self-reporting alcohol consumption and all forms of violence were. (i) Victims of violence OR = 1.75, CI: 1.64 – 1.86, (ii) Participant and instigators of physical fights OR = 2.09, CI: 1.97 – 2.22) and (iii) self-directed violence OR = 0.53, CI: 0.49 – 0.57 (see Table 4).
- *Age and gender*: Table 4 shows crude associations (OR and 95% CI) for age and three forms violence and adjusted for country. Chi square test for gender (males compared to females) and the three forms of violence gave $p < 0.0001$ for all associations. Logistic regression controlling for country also produced odds ratios showing a positive association between gender and violence when males are compared to females. Other predictable variables associated with all forms of violence are loneliness, insomnia, cigarettes use, use of other drugs, parental

involvement, victims of bullying, physical activity on less than two days in past week, skipping school and having no close friend are shown in Table 4.

Table 4. Crude association of demographic, environmental, and psychological factors with 3 forms of violence (main outcome) and alcohol (main exposure) adjusted for country

Assessment of Confounding Factors

Confounding factors associated with victims of violence and alcohol use were cigarette use, use of other drugs, and insomnia (see Table 5). Likelihood ratio test ($p < 0.0001$) identified cigarette use, use of other drugs and insomnia as factors to be included in the final model.

Confounding factors associated with participants who instigated or participated in physical fights and alcohol use were cigarette use, use of other drugs, and parental involvement (parents checking homework, parents knowledge of adolescents whereabouts and parents who understood participants problems) (see Table 6). Likelihood ratio test ($p < 0.0001$) identified cigarette use, use of other drugs and parents knowledge of participants whereabouts as factors that should be included in the final model.

Confounding factors associated with self-directed violence and alcohol use were parental involvement parents checking homework, parents knowledge of adolescents whereabouts and parents who understood participants problems) (see Table 7). Likelihood ratio test ($p <$

0.0001) identified all three variables (parent checking homework, parents knowledge of child whereabouts, and parents understanding child's problems) as factors that should be included in the final model.

Final Models for Alcohol Consumption and the Three Forms of Violence

Adjusted odds ratios (OR), 95% CI, for factors associated with victims of violence and alcohol use (exposure) identified cigarette use, use of other drugs, and insomnia producing anxiety confounded the effect of alcohol on adolescent victims of violence (see Table 5). Likelihood ratio test to assess the contribution of each confounding factor to the final model, that is, to test the null hypothesis that adding them does not improve the fit of the model. All variables (cigarette use, use of other drugs and insomnia producing anxiety) showed very strong evidence against the null hypothesis ($p < 0.0001$).

Alcohol use and victims of violence: This model produced OR = 1.47, CI: (1.37-1.58), $p < 0.0001$, after adjusting for Cigarette use, use of other drugs, insomnia producing anxiety, age and country.

Alcohol use and Instigating or participating in physical fights: This model produced OR = 1.92, CI: (1.77-2.09), $p < 0.0001$, after adjusting for Cigarette use use of other drugs, parents knowledge of whereabouts of adolescent, age and country

Alcohol use and self-directed violence: This model produced OR = 0.49, CI: (0.44-0.55), $p < 0.0001$, after adjusting for parents checking homework, parents knowledge of whereabouts of adolescent.

DISCUSSION

The prevalence of the three forms of violence (i) victims of violence 37.6% (ii) instigating or participating in physical fights 39.4% and (i) self-directed violence 79.4%, among adolescents in the Caribbean is relatively high. Alcohol consumption among

participants 43.8% was quite high and positively associated with (i) victims of violence and (ii) instigators and participants who engaged in physical fights but negatively associated with self-directed violence (thoughts of suicide). Behavioral and environmental predictors such as: use cigarettes, use of other drugs, parental involvement, victims of bullying, limited participation in physical activities, skipping school and having no close friends were associated both with alcohol consumption and the three forms of violence. Although the prevalence of alcohol increased with age, the prevalence of violent activities decreased among older participants.

Alcohol consumption in the Caribbean among adolescents was not explored in the past. However consumption among adolescents in the Americas varies widely by country, from 15% to 51% [1]. In South America frequent alcohol consumption and binge drinking are common among secondary school students [1, 13]. This study brings new evidence supporting the notion that alcohol consumption in the Caribbean maybe very similar to its surrounding regions, the Americas.

Alcohol consumption is largely a social behavior, where individuals learn from practice with other members of their culture: family members, peers and significant others [4]. Consequently the drinking behavior of adolescents in any country, culture or region is a reflection of the drinking behavior of the entire population [4]. This is of concern since early exposure to alcohol is associated with an increased risk of addiction in adults [1, 14]. In addition, economic, psychosocial and environmental factors are also associated with alcohol consumption at an early age, some of which were identified as predictors of alcohol and violence in this analysis.

Alcohol use by adolescents is also associated with violence and suicide attempts [15, 16]. While these associations suggest that alcohol use and violent behavior are part of a larger lifestyle, they do not necessarily indicate that adolescents engage in these behaviors while under the influence of alcohol. Very few studies have examined adolescent involvement in alcohol related violent behaviors. This study supports the findings of a similar study done on Argentine's adolescents where adolescent's drinkers were more likely to engage in violent behaviors [1].

In the Caribbean culture, parents value a punitive, restrictive approach to discipline and child rearing such that obedience and docility is valued [6]. This harsh and punitive parenting style has been associated with aggressive, deviant, and acting out behaviors among adolescents [6]. As a result the tendency to act out or engage in violent behaviors are more likely to occur and is associated with alcohol consumption. The vast majority of studies available in the literature did not assess different forms of violence, nor used identical age groups, making them very difficult to compare. In addition they targeted European and North American adolescents [1]. This analysis, takes a more comprehensive approach examining the association of alcohol consumption with both active and passive violence

This study found many psychosocial and environmental predictors of alcohol and violence. An unexpected but interesting finding is that adolescents who consumed alcohol was less likely to have serious thoughts of suicide. Little information is available about the possible role of alcohol in suicide by non-alcoholics, but some studies indicate that a proportion had been drinking shortly before their death, perhaps to bolster their courage [4]. This protective association, found between alcohol consumption and thoughts of suicide maybe as a result of reverse causality, where adolescents who had thoughts of suicide may have drank alcohol which in turn caused them to have less thoughts of suicide.

Parental involvement, a strong predictor for three forms of violence is of much concern. The positive association found emphasizes the importance of parenting skills, communication, and the overall parent-child relationship. Poor parental monitoring is also relatively strongly linked to delinquency [17]. Parental monitoring: parental knowledge of the child's whereabouts, the active tracking and tracing of the child's whereabouts by parents, and child disclosure, all having links to delinquency that are relatively similar in magnitude [17]. Given that both parenting dimensions of support and control are linked to delinquent behavior, parenting styles could be important risk factors for delinquency (that is, the combination of the dimensions support and control). In particular, a neglectful parenting style may be linked to delinquency which is linked to deviant behaviors [17, 18].

The African-Caribbean family has unique mating and childrearing patterns. Some of these patterns include absent fathers, grandmother-dominated households, frequently terminated common-law unions, and child-shifting, where children are sent to live with relatives because the parents have migrated or have begun a union with another spouse [19]. Families tend to have a matri-focal or matri-centric structure. Approximately 30 to 50 percent of African-Caribbean families are headed by a female: Jamaica: 33.8%; Barbados: 42.9%, and Grenada: 45.3%. [19] Single-parent families have more difficulty in providing the necessary conditions that prevent crime and deviant behaviours. The demands of single parenting can make monitoring their child difficult and others in the community. Thus a higher proportion of single parent families result in a greater opportunity for an adolescent to participate in deviant behaviours [19].

Predictors such as cigarette use and use of other drugs and their confounding effect on the association between alcohol and violence is well known [9]. The easy access to alcohol, cigarettes and other drugs must be examined to determine how access acts as an enabling factor that influences their use among adolescents. Further, in Caribbean societies, law-enforcement related to underage drinking is not emphasized because alcohol is not regarded as a drug that can cause harm when consumed in moderation [6]. Social functions and festive seasons, especially the annual celebrating of the abolishment of slavery (carnival) and Christmas, is marked by excessive alcohol consumption among the population. This acceptance of alcohol consumption and the easy access, may very well act as enabling factors that encourage alcohol consumption, cigarette use and other drugs among Caribbean adolescents. Another drug, Cannabis (marijuana), not identified separately as a drug in the GSHS, must be examined in the future to determine how its use is associated with violence, alcohol consumption and deviant behavior among adolescents.

The results of this analysis underscores the complexity of this issue and the urgent need to focus on the adolescent population. Prohibitive national measures as minimum drinking ages have had little effect [5]. Public Health interventions to discourage and decrease adolescent alcohol consumption would alleviate other pressures on teenagers such as, marketing of alcohol to youths and teenagers [5]. Many different efforts involving individuals and the environment to improve the success of youth anti-alcohol behaviors at varying levels must be employed. Further, programs that alert parents on the dangers of youth drinking and provides parenting tips will be critical for the success of anti-alcohol youth programs [1, 20].

These interventions will provide tools that foster open communication between parents and children about alcohol thereby reducing the pressures placed on adolescents to make decisions by themselves. Schools based and health care programs may also be useful in combatting the enabling factors that encourage adolescent drinking. This issue merits much

reflection since alcohol consumption is associated with many outcomes, road traffic accidents, violence and consequently the risk of death [5].

Mental health and parental involvement predictors identified in this analysis must be considered seriously. Psychological support services in schools and communities must be available to adolescents [21]. The adolescent period is marked by significant physiological changes that may affect an adolescent in many ways. Feelings of loneliness and insomnia producing anxieties are only two of the many intra-personal challenges adolescents face during this unstable and ever changing period. Intervention programs should focus on training parents on how to actively monitor and guide their children in order to enhance parent's knowledge on the whereabouts of their children [17]. Training should emphasize improvements in parent-child relationship and trust, since this will enhance disclosure by adolescents. Further, practitioners, should be alert to parents who neglect their children because of its association higher levels of delinquent behavior [17].

The strengths of this analysis include, nationally selected samples using multi stage sampling techniques, coupled with high participation rates. As a result representative samples were obtained minimizing the possibility of selection bias and preserving external validity. However, there are limitations that must be acknowledged. The low numbers of 11-12 year olds (1-2%) participating from 5 countries is of concern and could have introduced selection bias skewing the results in the direction on increased prevalence of alcohol use and therefore inflating the association between alcohol use and violence because older teens tend to consume more alcohol and more likely to participate in violent activities. Secondly, there was no data on suicidal thoughts from Barbados. This would have introduced some form of selection bias depending on prevalence of suicidal thoughts in that country and may have contributed to an over estimation or underestimation of the prevalence of and the association between alcohol use and suicidal thoughts. Further, the GSHS is a self- administered survey, so some participants may have misinterpreted or misrepresented their behaviors and perceptions with no validation by parental or social data. This misrepresentation is influenced by the participant's perception of desired and undesirable behaviors resulting in over reporting or under reporting of exposures and outcomes depending on their interpretation of acceptability in their community or their belief system.

Additionally, this cross sectional design used different time scales for alcohol consumption (previous month) and violence (during past year). As result it is not clear whether the exposure preceded the outcome or the outcome led to the exposure, reverse causality. Further the cross sectional design does not allow for the interpretation of results based on causality. Notwithstanding these limitations, the results of this study identifies a possible link between alcohol consumption and various types of violence in Caribbean adolescents aged 12-16 years.

CONCLUSION

The findings of this study confirms what has been found in European and North American cultures about the association between alcohol consumption and violence. Since most information acquired about drinking patterns and violence is based on data from European and North American countries, global comparisons are difficult to make.

Furthermore studies on drinking have used different age groups making it even more difficult to compare and contrast these patterns.

The apparent increase in alcohol consumption for adult populations in developing countries maybe also be reflected in the increase of alcohol use in adolescents. However there are demographic, psychological, environmental and cultural factors that also influence adolescent alcohol use and violent behaviors. Exposures to cigarettes and other drugs are important predictors that must be considered. Further the access to these, in Caribbean cultures may be enabling factors that encourage alcohol use and its related outcomes.

An important predictor that should not be ignored is parental involvement in their child's life. Parents directly and indirectly influence their adolescent's behavior through modeling, and parent-child relationship [6, 17]. The effective monitoring and support, as well consistency with positive parental modelling cannot be overlooked. Further single parent living environments reduce social control and may lead to an increase in deviant behavior. In addition, anti-social behaviors (no close friends, limited participation in physical activities) among adolescents are also predictors of violence.

Interventions to reduce alcohol consumption and violence among adolescents must focus on varying levels of society (advertising, access, enforcement of laws), adolescents and parents. In particular strengthening of the parent-child relationship will benefit both parents and children [1, 20]. Future studies must focus on standardized measures for international, regional and local comparisons. This will allow for a better understanding of the true patterns that may exist. Finally this study findings are particularly important in today's climate, in which violent behavior in youth has increased over the years.

ACKNOWLEDGMENTS

I would like to thank my colleagues from the department of Public Health and Preventive Medicine at St. George's University who provided insight and expertise that greatly assisted the research. I must also acknowledge Dr. Helen Weiss, Professor at University of London for assistance with the data analysis methodology and for comments that greatly improved the manuscript.

INTRODUCTION

Influenza (flu) is a disease that we expect to see each year. Many engage with the flu, if only to prevent it, by washing hands or getting the annual vaccine. While it can be deadly, for most people the flu merely causes intense misery and then passes. In 1918, however, the world witnessed a global influenza pandemic that was radically different from any that has been recorded before or since: at least 20 million people died worldwide, and unexpectedly, otherwise healthy young adults proved to be particularly vulnerable. These factors, among others, ensured that the 1918 pandemic (often called the Spanish influenza) was disruptive and fearsome. That is the pandemic that Nancy Bristow will discuss, with a particular focus on who suffered. Like many episodes in public health, the answers are not simply tied to the scientific and medical realms, but also include factors in the social and political arenas.

Because physicians and scientists did not know the cause of the Spanish influenza in 1918, they could neither treat nor prevent it effectively. Local boards of health and governments tried various solutions from banning large public gatherings to requiring the wearing of face masks in public and instituting quarantines. Over the last century, the growth in knowledge about the flu, the increased organization of the public health infrastructure, and practice with flu preparedness have influenced the development of contemporary public health plans. Some of these plans grapple with issues in historically important ways, such as finding methods for massive, safe disposal of contaminated bodies in urban communities or determining how to provide medical care for a population in need that has suddenly increased

in size. The plans vary at the state and municipal level, and may need to be implemented or adapted in unforeseen ways during actual crises. Tim Soucy and Dora Mills will speak to situations based upon their experiences at the local and state level, respectively.

LECTURE

THE HISTORICAL PERSPECTIVE: THE 1918 INFLUENZA PANDEMIC

*Nancy Bristow,
Professor of History at the University of Puget Sound*

Early in the evening of Wednesday, September 25, 1918, a woman named Agnes L. Swenson died in Rye, New Hampshire. Her obituary said that she had worked at the First National Bank, was a Christian woman, and was known for her “kindly nature and fine qualities of heart and mind.”¹ Just a few days short of turning 36, Ms. Swenson had contracted influenza and left work early the previous Friday. Five days later, she died of pneumonia. *The Portsmouth Herald* acknowledged her passing saying news of her sudden death was a sad blow to her family and friends: “All who knew her can sympathize with the family in their deep bereavement.”²

For the people of Rye, New Hampshire, it was, indeed, a sad day, but soon, people throughout the US and around the world would know the same kind of bereavement. Agnes Swenson was one of the early casualties in the worst pandemic in the history of human beings. Perhaps 50 million people died of this influenza pandemic in the winter and spring of 1918–1919.³ Within days of Swenson’s death, it had reached epidemic proportions in New Hampshire. Between October 6 and 15, 205 people died in the single city of Manchester, New Hampshire. The worst losses for the state followed in the week of October 12 when 393 people died—this in a population smaller than 450,000.⁴

When the pandemic struck, public health leaders moved quickly to try to stamp out the grim epidemic. As early as September 18, *The Portsmouth Herald* reported on a “steady increase” in the number of victims, but noted that “the entire force of the public health service is working on the cases and hope to check it.”⁵ Within a week, the local Board of Health, in collaboration with the US Public Health Service, had opened the city’s first emergency hospital; a second would follow.⁶ By September 25, 1,000 people were sick and the Board of

Health, on behalf of the Mayor, ordered the closure of schools, churches, dance halls, and theaters; all public gatherings were banned, and even the county fair had to be cancelled.⁷ Public funerals were prohibited as well.⁸ Next they turned to the soda fountains and near beer saloons, which were closed several days later.⁹ The bans remained in effect for several weeks. Yet despite it all, the obituary section of the paper continued to run story after story of the city's losses to influenza. By early January 1919, more than 2,000 residents of New Hampshire had died in the pandemic.¹⁰

Fortunately, today we have many additional tools to use in our fight against influenza, and so our relationship to a flu pandemic might be a bit different. We have preventive vaccines. We have antivirals that can lighten the symptoms and shorten the course of an illness. We have antibiotics that can lessen the danger of certain secondary infections that were so costly in 1918. The reality, though, is that influenza remains a serious public health danger, even in the twenty-first century. For that reason, I believe that the voices of 1918 have much to tell us about how we might best handle our next influenza crisis.

One insight, based on research by scholars at the University of Michigan and the Centers for Disease Control and Prevention (CDC), is both very important and deceptively simple. Exploring public health outcomes in 43 of the 66 largest cities in the country, they have confirmed that non-pharmaceutical interventions, or NPIs, actually worked. What is an NPI? In this instance it means implementing social distancing measures—keeping people away from one another—such as cancelling public gatherings, closing down public spaces, and keeping people quarantined. NPIs worked by slowing down the progress of the disease, and lowering “the overall and peak attack rate,” a finding with great relevance to our own time.¹¹ With the availability of effective vaccines and antiviral treatments, slowing a pandemic's spread and delaying its worst impact would be still more effective today, giving us time to develop and put in use such prophylactic and treatment measures. Such practices, though, would raise significant civil liberties concerns, just as they did in 1918.

We know that in 1918 Americans didn't always accept the restrictions on their freedom of movement during the pandemic. Now that we know just how valuable these restrictive measures were in combatting influenza, it is all the more important to understand why people did or did not follow the rules. What led so many Americans to accept such tight restrictions on their liberty in the early days of the pandemic? Why, in turn, did many of those same Americans later withdraw their cooperation? And were there other populations whose relationship with the authorities was troubled from the beginning? I want to focus on answers to those questions, arguing that in 1918 the American public, widely accepting of public health measures initially, later rejected the authority of governmental and health officials when they felt misinformed, misled, and even lied to—in short, when they found the words of

Stern, and Martin S. Cetron, “Nonpharmaceutical Interventions Employed by Major American Cities During the 1918–1919 Influenza Pandemic,” *Transactions of the American Clinical and Climatological Association* 119 (2008):129–142.

those leaders dishonest and empty. Furthermore, some Americans had a conflicted relationship with public health authorities throughout the pandemic because they found themselves the targets of discriminatory, unjust, or culturally insensitive treatment. The takeaway lesson from 1918 that I wish to offer us is the value not only of NPIs, but of honest and ethical leadership.

To make sense of the choices Americans made during the pandemic we must begin with the context within which they made those choices. As the example of Portsmouth suggests, when the pandemic struck, Americans faced it with a new confidence in the ability of medicine and public health to protect them from such a scourge. In the late nineteenth century, the new field of bacteriology had allowed scientists to discover the causative agents for several diseases, including dysentery, malaria, scarlet fever, leprosy, bubonic plague, typhoid, yellow fever, gangrene, and whooping cough, and as a result to begin to control some of these illnesses. By the early twentieth century germ theory had gained traction, and “regular” allopathic practitioners dominated the American medical scene.¹² Many people, including health care professionals, began to imagine a world without infectious disease.¹³

These changes in medicine had enormous implications for the field of public health as well. To get a sense of this, note that in the mid-nineteenth century, Americans’ health had declined, with rising death rates and falling life expectancy brought on by urbanization.¹⁴ But this worsening situation offered new opportunities to increasingly professionalized public health practitioners, who pushed for the creation of city and state health boards and the reform of what was evolving into the US Public Health Service. Facilitated as well by the Progressive Era’s broad-based efforts to reform American cities, public health leaders employed new measures ranging from garbage removal and basic hygiene education to clean water and sewage systems to make significant contributions to Americans’ health. The nation’s entry into World War I only heightened the stature of the public health profession, as the field contributed to soldiers’ health.

And then the pandemic hit. Perhaps originating in Kansas—we call it Spanish Flu for reasons that are not relevant here—it might accurately be called the American Flu.¹⁵ It passed through in a first wave in the spring of 1918 largely unnoticed because it sickened lots of people but killed very few.¹⁶ When the second wave started its rampage in Boston in late

¹² Allopathic medical professionals are individuals who practice what is generally viewed as mainstream medicine today. Allopathic medicine contrasts with homeopathic or alternative medicine.

¹⁵ Although the Spanish people were not the only victims of the disease, since Spain was a neutral country during World War I, there was less censorship there than in other nations. News of the influenza flowed out of the country, and thus it gave its name to the disease.

¹⁶ Alfred Crosby, *America’s Forgotten Pandemic: The Influenza of 1918* (New York: Cambridge University Press, 1989), 18–19. Military camps were the notable exception. See Carol Byerly, *Fever of War: The Influenza Epidemic in the US Army during World War I* (New York: New York University Press, 2005), 70–71. For a useful account of the first spring wave of the epidemic, see John Barry, *The Great Influenza: The Epic Story of the Deadliest Pandemic in History* (New York: Penguin, 2004), chap. 14.

August, however, there was no question that Americans were facing a new and different disease.

How did they know it was different? First of all, the symptoms were simply horrific. Some people suffered only what we think of as the flu: you feel terrible, you have a fever, you're achy, you feel just awful. But with this new influenza, the vast majority would suffer a much more serious disease with very high fevers, very serious muscle and joint pain, and immobilizing prostration and weakness. Other symptoms included chills, and edema in the lungs—the lungs would literally begin to fill with liquid. Some patients would begin to recover at that point, but others would get sicker still, facing delirium and a descent into unconsciousness. Watching these symptoms develop was traumatic for family caregivers, as patients suffered from bloody fluids leaving their bodies. Then, finally, because of cyanosis, extremities and faces would turn blue or black as the person was sickening and dying. As three military doctors reporting on the pandemic at Camp Upton in New Jersey conceded—and, remember, these were people who were familiar with the horror of illness—"the memory of this sight will haunt for life the minds of those who saw it."¹⁷

The shock of the illness was reinforced by the rapidity with which it spread. By the end of the pandemic, 28%—more than a quarter of all Americans—had been sickened by the flu. The epidemic was serious enough to lower life expectancy in the US in 1918 by 12 years; it was 25 times as deadly as regular seasonal flu.

Also strange, and destabilizing, was the reality of who was sickening and dying. When you plot the age of normal influenza victims on an x-y graph, you get a U shape—the young and the old are the most common victims of the disease. But deaths from influenza in 1918 charted as a W—almost half of its victims were people between the ages of 20 and 40.¹⁸ Imagine moms and dads as common victims, or the people who work to keep communities running. That's who was passing away in this catastrophe. And it was in this chaotic context that public health leaders tried to take control.

The reality is that, in 1918, we still had a very uneven public health structure in the US. It varied enormously from state to state and city to city in terms of infrastructure. Political and cultural realities varied across and within communities as well. Even so, there are certain patterns in the public health efforts that were broadly shared, and looking back, are easily discernible.

The common first step in the effort to prevent influenza and contain the pandemic was education—public health leaders knew they needed people to understand what was happening. Officials worked very hard to publicize their message and make it accessible; they used cartoons and translated the information into multiple languages.¹⁹ The point of education

¹⁹ Rupert Blue, "Epidemic Influenza and the U.S. Public Health Service," *Modern Hospital* 11 (December 1918): 425; "Droplet Infection Explained in Pictures," *Public Health Reports* 33, no. 46 (November 15, 1918): 1969; "Red Cross Bulletin—Spanish Influenza," File 803.7: Epidemics—Influenza—Publicity and Publications, Box 688, Record Group 200, National Archives, College Park, MD. By pandemic's end the US Public Health Service had produced 6 million copies of a brief pamphlet entitled "'Spanish Influenza,' 'Three Day Fever,' 'The Flu,'" and a multitude of posters, articles and a "daily bulletin" for use by the press, while the Red Cross published a pamphlet, "Spanish Influenza," which it translated into eight languages. As the noted influenza

was to teach people basic public health practices such as washing their hands, avoiding public drinking cups, and ceasing “promiscuous” (as it was called then) coughing, sneezing, and spitting.²⁰

Then, as things got worse, public health officials looked to more invasive measures. The Surgeon General of the US recommended the closing of “all public gathering places” if a community was “threatened with the epidemic” as in Portsmouth, New Hampshire. Many cities and towns did just that.²¹ Some institutions found ways to work within these rules. For example, in San Francisco church services might be held outdoors but the worshippers had to wear masks. New Hampshire College (a former name of the University of New Hampshire) reopened for classes but held them outside.²² (This was in October when it was getting quite chilly, of course.) Some cities varied transportation schedules, changed the times that people shopped, or did whatever they could do to try to cut down on overcrowding. Less common, but sometimes employed, was a requirement for people to wear masks in public or for the ill to remain quarantined until their illness passed.

As public health restrictions moved from voluntary to mandatory measures, and from simple to more invasive restrictions, initially most Americans continued to obey. But, as the pandemic persisted, public reaction began to shift as people resisted and sometimes simply stopped cooperating altogether.

The first question is, “Why would so many people be supportive of these public health measures at the beginning?” Certainly the months of war had given the public plenty of opportunities to cede power to the government and to obey new interventions in their lives—consider the draft, for instance. In fact, when mobilizing the public in the pandemic, authorities employed the war very intentionally, suggesting it was patriotic and part of the war effort to help fight the flu. As one poster from the Connecticut State Director of Health and the State Council of National Defense declared, “Help fight the Grippe [the flu], Kaiser Wilhelm’s ally.”²³ This call to the public was framed to capitalize on the war as a mechanism for motivating citizens to cooperate with public health demands. Another important factor was the confidence that Americans had in science: they were believers in its possibilities in 1918. Americans wanted to believe that those who had controlled yellow fever and diphtheria might help them against this new illness. Their confidence in the capabilities of science and

historian Alfred Crosby suggested, “If influenza could have been smothered by paper, many lives would have been saved in 1918.” Alfred Crosby, *America’s Forgotten Pandemic*, 49.

medicine encouraged them to trust the authorities and hope this trust would preserve their own and their community's health.

This mood, though, didn't last. Fairly quickly people began to resist, and the response worsened as the pandemic dragged on. Given the civil liberties issues involved in the restrictiveness of some of the public health measures, this may seem unsurprising. What is noteworthy, though, is how rarely questions of civil liberties were raised, even by those who resisted the public health controls.

And so we come to the second question, "Why do they begin to say no?" I want to suggest that the failure to communicate honestly with the American people undercut the relationship between the public and the authorities. I do want to preface this, however, by noting that leaders were motivated, at least in part, by a concern for the public calm. Indeed, the possibility of public panic was of enormous concern. So, the first thing that many public health officials did, and some did it over and over again, was tell people that everything was going to be OK, to downplay the risk. Most notable, perhaps, was the case of Royal S. Copeland, the health commissioner for New York City, who downplayed the danger beforehand, minimized its impact once influenza struck, and asserted many times over that the pandemic was under control when it was not.²⁴ Similar voices could be heard in New Hampshire. *The Portsmouth Herald* routinely reported "epidemic conditions improving," or that "the physicians are of the opinion that with three or four days of warm sunshine the disease may be brought under control."²⁵ Educational materials, too, almost never portrayed the depth of the dangers facing Americans, instead painting the pandemic as something familiar, as similar to the common cold, failing to prepare Americans for the realities they faced.²⁶

Such a calming story was often reinforced by overblown promises about the effectiveness of medicine and public health practices to protect against influenza. These narratives, whether born of concerns for public calm or an inflated over-confidence, created heightened expectations among lay people. When these were unmet, the people rejected the authority of public health officials, and began to resist. In Sanford, New Hampshire, for instance, a clergyman took a case about the closure of churches to court.²⁷ In eastern and northern Maine, people complained when their liquor was seized for use in the pandemic.²⁸ When the third

²⁴ On reassurances before the pandemic hit, see "No Quarantine Here Against Influenza," *The New York Times* August 15, 1918, 6. For an example of his statements of the pandemic being under control, on October 6, 1918, for instance, when influenza had sickened 2,070 additional New Yorkers in the previous 24 hours, Copeland argued that given the population New York, he did not "consider that the city is stricken." He would not create an emergency committee to deal with the flu until mid October. "Revise Time Table in Influenza Fight," *The New York Times*, October 6, 1918, (1) 8; "Asks Experts' Aid to Check Epidemic," *The New York Times*, October 13, 1918, 18.

²⁵ "Epidemic Conditions Improving," *The Portsmouth Herald*, October 2, 1918, 6; "One Death From Influenza Wednesday," *The Portsmouth Herald*, September 26, 1918, 5.

²⁶ The widely-circulated USPHS pamphlet, "*Spanish Influenza*" "*Three-Day Fever*" *The Flu*," for instance, reassured citizens that epidemic influenza was a common occurrence and compared Spanish flu to the common cold and the yearly flu, and though acknowledging that more severe symptoms arrived more quickly and that deaths had resulted, noted that ordinarily the "patient recovers" and deaths were the result of "a complication." Rupert Blue, "*Spanish Influenza*" "*Three-Day Fever*" *The Flu*," reprinted in *Public Health Reports*, (September 25, 1918, Supplement 34).

²⁷ "Opening of Church at Sanford Will Make Test Case," *The Portsmouth Herald*, 25 October 1918, 7.

²⁸ Editorial Comment, *The Portsmouth Herald*, 8 November 1918, 4. Clergymen in Lawrence, Massachusetts protested against the closure of their churches, a response prompted in part by the continued functioning of saloons. Editorial Comment, *The Portsmouth Herald*, 15 October 1918, 4.

wave came raging through communities, Americans were even less cooperative, and public health and political authorities found themselves unable to control the citizenry any longer.²⁹

There is one last issue I want to raise. I can't say that there was a definitive connection between resistance and mistreatment, but I think we have to wonder whether the neglect or abuse of certain populations undercut a positive relationship between segments of the public and authorities, decreasing the citizen's willingness to cooperate with officials. Continuing a long history of medical neglect, the government's treatment of African Americans during the pandemic was notoriously discriminatory. When Richmond, Virginia, opened an emergency hospital in John Marshall High School, black patients were initially placed in beds in the basement until a segregated, all-black hospital could be established. Philadelphia, worst hit of all American cities, opened several emergency hospitals for its white citizens, but none for African Americans.³⁰ Native Americans also faced hostile behavior from the authorities. Already suffering poverty and poor health as a result of government policies and reservation life, Indians experienced the dual trauma of influenza and cultural displacement as public health officials used the influenza crisis on the reservations as another opportunity to replace traditional health-care practices.³¹ Officials referred openly to the "average case with the Indian" and the problems of "combativeness" and "Indian philosophy" that interfered with their work.³²

In urban areas, poor communities also found themselves the target of condescension and cultural misunderstanding in the midst of the pandemic. Already living on the edge of material want, an influenza illness or death often left poor families destitute and reliant on the assistance of both state-run and private aid organizations. Visiting nurses and social workers routinely described the "dirt and lack of order" they observed in the homes of the poor, and often assumed such conditions reflected deeper moral problems.³³ As one student nurse working in Boston explained, "To nurse in an epidemic was like meeting a creeping foe allied

²⁹ For one example, see "Guarding Against Influenza," *Public Health Reports* 33 (December 20, 1918): 2258.

³⁰ Marian Moser Jones, "The American Red Cross and Local Response to the 1918 Influenza Pandemic: A Four-City Case Study," *Public Health Reports* 125 (2010, Supplement 3): 101; Vanessa Gamble, "'There Wasn't a Lot of Comforts in Those Day': African Americans, Public Health, and the 1918 Influenza Epidemic," *Public Health Reports* 125 (2010 Supplement 3): 119.

³¹ These efforts are recounted, for instance, in a memo from D.A. Richardson, MD to P.T. Lonergan, Superintendent, Subject: Influenza Epidemic at Pueblos of Albuquerque Day School Section, available online as "Letter from visiting doctor reporting situation to superintendent, Albuquerque Day School, New Mexico, December 20, 1918, Bureau of Indian Affairs," available online at "The Deadly Virus—The Influenza Epidemic of 1918," National Archives and Records Administration Online Exhibit, accessed September 12, 2013, <https://www.archives.gov/exhibits/influenza-epidemic/records/visiting-doctor-letter.pdf>. The removal of many children to Indian schools, too, created a context during the pandemic in which families suffered the additional pain of separation and the inability to provide appropriate burial rites when children sickened and died. As one mother wrote when her daughter died, "I would have felt better if I could have seen her." Mrs. Annie Murphy to Mr. Harwood Hally [sic], October 16, 1918, Mary Murphy File, Student Files, Chemawa Indian School, Box 66, Record Group 75, National Archives, Pacific-Alaska Region, Seattle, WA. On Indian schools, see David Wallace Adams, *Education for Extinction: American Indians and the Boarding School Experience, 1875–1928* (Lawrence, KS: University of Kansas, 1995).

³² "Letter from visiting doctor reporting situation to superintendent, Albuquerque Day School, New Mexico, 20 December 1918," available online at "The Deadly Virus—The Influenza Epidemic of 1918," National Archives and Records Administration Online Exhibit, accessed April 20, 2017, <https://www.archives.gov/exhibits/influenza-epidemic/records/visiting-doctor-letter.pdf>.

with ignorance, poverty, superstition, immorality, and hopeless fear.”³⁴ Suspicion of the poor’s motives made it more difficult for them to seek aid, even as aid workers assumed moral failings and sometimes intervened in the private life of families.³⁵ Such mistreatment could produce resistance, and likely always damaged the relationship between communities and the state, mitigating against the embrace of the public health leadership and its policies.

Thus, we are offered two additional lessons that might guide our future efforts to manage influenza pandemics. First, while preventing panic will remain a priority, Americans must be told the truth if we again face pandemic influenza. The seriousness of the situation, the unpredictability of pandemic influenza, the complexity of public health officials’ efforts, and the uncertainty about the effectiveness of those efforts must all be acknowledged and discussed. Given the value of NPIs but acknowledging their corresponding conflict with civil liberties, encouraging public cooperation with the needs of the moment will be vital. In turn, we must not only commit to the equitable treatment of all, but must also do the hard work of interrogating our own culture in order to understand how (and whom) we might stereotype, underserve, and over-police. The crisis of a pandemic must not again be an occasion for the punishment of our most vulnerable citizens. The voices of 1918 have much to tell us about the risks a pandemic might present. Only we can do the hard work of understanding those lessons for our own time.

MODERN PUBLIC HEALTH PERSPECTIVE: THE VIEW AT THE STATE LEVEL FROM SOMEONE ON THE GROUND

***Dr. Dora Anne Mills, Vice President for Clinical Affairs and Director of Public Health Programs at the University of New England,
and Former Head of Maine’s CDC***

Between 1996 and 2009, I spent a lot of time working on pandemic preparedness as the head of Maine’s Bureau of Health [now called Maine’s CDC]. We had an emergency team at the state level, and we would spend time doing pandemic flu exercises. We based our exercises on the 1918 pandemic flu. In fact, I had spent some time going through old newspaper clippings from around the state from the years of the Spanish influenza. One of the big lessons we learned was that it had been an extremely severe pandemic, and most pandemics aren’t that extreme. Nevertheless, in our office, we always thought that if we prepared for the worst, we could scale down if necessary—but actually it was harder to scale down than we thought.

³⁴ Miss Franklin, “Personal experiences during the epidemic,” Student nurse epidemic accounts, Folder 1, Box 8, RG 22.1, Department of Nursing, Academic Departments, College Archives, Simmons College.

³⁵ On the suspicions about a family’s need, see Case #13369, Reel #194—Family Welfare, Minneapolis Family and Children’s Service Case Records 1895–1945 (SWF19), Social Welfare History Archives, University of Minnesota Libraries. The example of a poor immigrant family living in Minneapolis illustrates social workers’ pre-occupation with the habits of their working-class clients, their assumptions about the immorality of those clients, and their use of the family emergency created by the epidemic as an opportunity to intervene. See Case #3126, Reel #16, Children’s Protective Society, Minneapolis Family and Children’s Service Case Records 1895–1945, Social Welfare History Archives, University of Minnesota Libraries.

The 2009 influenza pandemic started the third or fourth week of April, 2009. I know exactly where I was because it was spring vacation week, and my children were in elementary school at the time. My husband is a Civil War buff and we were driving through the back roads of southern Virginia looking for Appomattox. My cell phone rang; it was the US Centers for Disease Control (CDC) Emergency Operation Center. It was Thursday the 23rd. They said we had an emergency conference call I needed to be in on in about 20 minutes, to talk about an emerging pandemic. I thought it was some sort of joke; it just didn't seem real. I was like, "Well, we're trying to look for Appomattox." Anyway, it turned out to be the real thing, and we did go to Appomattox but high-tailed it back up to Maine immediately after. Fortunately, I had an air card in my laptop and a cell phone, so I was able to put out a health alert and convene conference calls with the state team while on the road.

We brushed up our pandemic plans. In fact, I was re-reading them as my husband was driving us up the highway to Maine. Of course, the plans talked about this pandemic starting somewhere in Asia or Africa, or somewhere else, and taking weeks to get here. In 2009, though, we had some cases of a new strain of influenza in Texas and California. We knew that there were hundreds of young people hospitalized or dead in Mexico. That was about all we knew. We did not have a lot of time to prepare because, again, it was spring vacation week and, guess what? A lot of people from Maine had gone to southern California, Texas, and Mexico to vacation.

We had five days to prepare—our plans had predicted that we'd have weeks. By the following Wednesday, we had our first cases in Maine, and we had closed two daycares and a school. It really was on our doorsteps within days.

As Nancy Bristow mentioned, an influenza pandemic is very different from even a bad seasonal influenza year. In a pandemic, there is a shift in the virus, and in 2009 there was a particular shift in who was impacted. Normally, with seasonal flu, 90% of the deaths are amongst people 65 and older. With the 2009 pandemic flu, 90% of the deaths were *under* 65 years of age. That's important because over the years we had geared up the 65-years and older population to want vaccine and took precautions. We hadn't really geared up the younger people. There are also waves in pandemics that are often not present during the seasonal flu seasons. There is higher transmission, and it can impact different areas differently. To show you how quickly the progression of H1N1—which was the strain of the 2009 flu—spread, in April of 2009 there were two countries with this particular form of influenza: the US and Mexico. By the summer, it was in more than 200 countries.

This raised many concerns. I had very intelligent people asking me if we should close the bridge between Maine and New Hampshire to close the borders. I said, "You know what? As much as there are some things that work, that is not going to work." One of the goals for addressing a pandemic in public health is to limit the burden of disease. That's obvious, but it's also important to minimize social disruption. Yes, we could close everything down, but we know that that's impractical for many reasons. The role of medication in public health is to delay the pandemic, and to lower its effects, because when you have too many patients, the health care system is overwhelmed and can't respond very effectively.

To go back to the 2009 influenza as a case study, there are three big challenges that I'd like to talk about, and I don't have all the answers. These challenges hit me because we hadn't really prepared for them, and partly because this wasn't as severe a pandemic as that of 1918. Again, that ability to scale down was challenging.

The first action when fighting a pandemic is in surveillance, particularly during the early detection phase. The four pillars of public health functions are surveillance, medication, vaccination, and communication. I always hesitate to use the term “surveillance” in public—I always call it disease tracking—because we’re not part of the NSA, the CIA, or any other intelligence agency.

In the world of public health, however, we do use the word surveillance. One of the key actions early in a pandemic is to detect whether the disease has hit an area early: this is early detection. As the pandemic evolves, surveillance is used both to monitor the evolution of the virus and to monitor outbreaks. It becomes less important that people get tested.

Challenge #1: Need to Know vs. Privacy

One challenge is to balance the public’s need or desire to know versus an individual’s privacy. Most people have heard of the Health Insurance Portability and Accountability Act (HIPAA). There are laws in the US that state that health information needs to be kept confidential with certain parameters. Most state laws mirror HIPAA, and HIPAA is actually fairly silent in terms of what public health agencies can provide for the information that they have.

HIPAA is very clear that health care providers have to report to public health agencies, but HIPAA is less clear about what public health agencies can do with that information. State law in Maine, and in most states, basically leaves it up to the public health agencies to decide the extent of the information that they are going to make public. In April of 2009, we had those first few cases, and suddenly everybody wanted to know: Who were they? Where did they live? At the state public health board we had decided early on that we would give data by county, and so we said that our first few cases were in Kennebec and York counties. (York County is just a few minutes from the New Hampshire border.)

It wasn’t hard for people to figure out who some of the first cases were because we had closed two daycares and a school. In that small town in York County, everyone knew which family had gone to Mexico and had come back sick, and had thus caused the school to be closed. Still, we were not giving out names. We did give the school name, but it was hard not to. We didn’t give out the daycare names. (One of the daycares did get in to the press and unfortunately went out of business a while later. I’m not sure if the pandemic and the closure were connected, but they may have been.)

We were under a lot of pressure to provide more information about the early cases, and not just from the media. The reporters I worked with mostly understood why we were trying to protect people’s privacy. Instead, with all due respect to my colleague Tim Soucy from the city of Manchester, New Hampshire, it was local officials who pressed us. It was not local public health officials, particularly, but first responders—fire fighters, and police—who said, “We need to know who these people are. If they’re in our town, what if we get called to their house? We want to know that they have flu.”

Now, what disease from 25 or so years ago—30 years ago—taught us that you don’t need to know who those people are? HIV/AIDS. It wasn’t until 1987 that universal precautions were recognized as a *bona-fide* strategy so that if you’re going to be in contact with blood or respiratory secretions or whatever, you use barriers because you don’t know who is positive

and who is not. With this in mind, I was trying to educate our first responders by saying, “You don’t need to know who those people are because if you go into a household and they’re coughing, you should take precautions...” Just as you would for HIV/AIDS.

Then, the first responders said that in other states the public health authorities for surveillance and disease control at the county or municipal level gave out specific information about sufferers. For example, fire fighters and police at the local level in many other states had the names and addresses of early sufferers in the pandemic. In some states that was true, and in some states it wasn’t. Now, I don’t think that this issue really existed to the same extent in 1918. We are in the information age these days, and we’re in the information dissemination age, too. I propose that this is an issue that impacts our civil liberties in a way that we have not clearly figured out, although I’ve asked for guidance from the CDC a number of times over the years, including when we had Severe Acute Respiratory Syndrome (SARS) back in 2002–2003. The CDC has been fairly quiet on this issue, so that is challenge number one.

Challenge #2: Vaccinations

I can’t tell you how many hours I have spent in the Maine State Legislature because politicians have asked me to talk about the laws and details about mandatory vaccination. We have all kinds of laws concerning when and how you can mandate vaccines, what the exceptions are, etc. One of the issues that has interested me the most is to do with vaccine distribution. I’ve analyzed, in a report, the need for government authorities to distribute a vaccine—when there’s a shortage of that vaccine—in a fair and equitable way. That was a huge issue in 2009, and I will give you some data that show why.

First of all, we didn’t have any vaccine until October. The pandemic started in April, and while we had some waves of it in the summer, we knew the severe wave probably wasn’t going to come until the fall. It didn’t. We also didn’t have any vaccine until about late September/early October. In the meantime, with the help of the CDC, in Maine we began to plan who would get the vaccine and how to get it to them once it arrived.

During the late summer and early fall, the CDC got some influenza samples, at least enough to be able to characterize the virus better and to determine whom it was impacting most severely. This is great, except that the CDC’s guidance included almost half of the population of Maine, and Maine’s population was approximately 1.3 million people. I remember saying to CDC, “Thanks a lot. You really narrowed the population down,” because we knew we weren’t going to get 625,000 doses in the first week of the vaccine being distributed.

The people in the priority groups are those whom the pandemic flu impacts the most severely—plus significant others like health care workers. Including the Emergency Medical Service (EMS), this group of health care workers totals about 43,000 people in Maine. Ironically, most health care workers I’ve heard from think they’re in the priority group because they’re dealing with patients with flu and are, therefore, at risk. In fact, they are in the priority group primarily to protect their patients. A health care worker with the flu—and remember a sufferer is contagious for a couple of days before they come down with the symptoms—can be passing flu on to patients who are already sick for other reasons.

Next we had to figure out how many people could vaccinate others. According to the state's licenses, we have approximately 25,000 health care providers able to vaccinate. We actually passed emergency legislature in May, 2009, allowing pharmacists, for the first time, to vaccinate. People asked us, what about dentists? I said, "Well, you know what? We've got almost 20,000 nurses." That's whom we really focused on this time around. We recruited nurses, particularly many retired nurses and nurses at home with kids, to see if they would volunteer to vaccinate.

So, in September we had half of Maine's population as a high priority for vaccine and 25,000 or so people who were vaccinators. We had predictions of 80,000 doses of vaccine becoming available each week starting September 30th. We looked at the data and realized that our biggest problem was getting vaccinators out, specifically getting clinics up and running. We spent a couple of months establishing clinics in all kinds of schools, shopping centers, restaurants, and all over the place, and getting the vaccinators ready. When the vaccine arrived, we wanted to be able to flip the switch and everybody would start vaccinating. Then we got a call at the very end of September—the vaccine was not going to arrive as predicted.

What we didn't know was that we had five manufacturers of the vaccine, and four of them were offshore. We found out later that the Food and Drug Administration (FDA), who is responsible for licensing vaccine manufacturers, wasn't really monitoring the progress of the vaccines being manufactured overseas. We also had nine formulations of vaccine coming, and each could be used for a different group... So, we were supposed to start getting vaccine October 1st, but we didn't get the first batch until October 9th, and then only 8,700 doses.

Now, when you have 625,000 people in the highest priority list and they hear there are only 8,700 doses, each person thinks that there's one dose with his or her name on it. Keep in mind that the disease at the time was surging in many other parts of the country. On the nightly news, there were stories of kids dying and emergency hospitals being set up in parking lots. It was on the news every single night. We heard that the surge was on our doorstep, and we had but a drop of vaccine. The challenge, over those coming weeks, was to figure out how to get the vaccine to the high-priority people in a fair and equitable way. The first month, the vaccine that came to Maine was almost all nasal spray, which can only be given to healthy people from toddler age to age 50—it doesn't fit a lot of the high-priority people. We sent it out to our in-patient health care workers, and we got right into schools and vaccinated school children. We got a lot of push back.

We got push back from people who said, "Why are you vaccinating healthy school children and not me?" whoever the "me" was. To be fair, they were used to the fact that flu usually impacts a population other than grade school kids. However, we also know that school children are major transmitters of flu within a community. If you want to stop the transmission, you go to schools. That helps, but you are vaccinating a healthy population when you do this.

The disease surge came in November, and the biggest surge was Thanksgiving week. Now, we were also taking other actions. It wasn't as if we were just focused on the vaccine, and we did talk about the non-pharmaceutical inventions as Nancy Bristow mentioned. For example, hand-washing was one of the things that I thought was interesting. This is one of the

many posters the CDC put out at the time: “Are you the office sprinkler?”³⁶ It’s very reminiscent of the 1918 flu prevention posters.

Challenge #3: Balance of Authority within the Government

The third and last big challenge is the balance of authority. We always talked about the balance of power in government being judicial, legislative, executive, and we always prepared around that, because we had prepared for the worst case scenario where peoples’ civil liberties would be greatly impacted. We worked with the judicial branch and the legislative branch. The real issue in 2009 was the balance of power between the state, the federal, and local officials who are our partners. We all had to work in partnership, but the balance was really tenuous and difficult.

I should just quickly mention that, in 1918, the balance of authority was at the municipal level in Maine, as it was in many states. That changed in January of 1919: the state Legislature passed a law that gave public health authority in Maine to the state government. I think one of the lessons we learned was the very important role of our local partners—private and public—and that there needs to be a delicate balance of authority between local, and state and federal officials. This paraphrases Kierkegaard’s philosophy a bit: influenza epidemics are lived forward and understood backward.

Also, the state health officers in the New England states stayed in very close contact with each other. We met by phone every Monday morning at 7:00 AM, and we had very similar strategies. We had the highest vaccination rates in the country. I’m very proud to say that Maine—and I believe several other New England states—was one of the few states that had no child fatalities from the pandemic flu in 2009. One of the big reasons was that we got the vaccine into schools immediately.

To wrap up, I’ll leave you with a few facts: the most predictable thing about influenza is its unpredictability, and the influenza vaccine suppliers also are very unpredictable. Massive unpredictability is absolute certainty. It also takes a village to vaccinate and we have shared responsibilities, and being prepared is always good.

THE MUNICIPAL PERSPECTIVE: MANCHESTER, NH, AS A CASE STUDY

***Tim Soucy, Director of the Manchester Health Department
in Manchester, New Hampshire***

Before I start, let me apologize because you’re going to see some similar information from me regarding influenza. But, I do want to give you a slightly different perspective. I’m

³⁶ An example of a poster with this message, although one published by a state, can be found at the Utah Government Digital Library. Bureau of Epidemiology, Center for Disease Control and Prevention, Utah Health, “Are You the Office Sprinkler?” (Utah: Department of Health, 2010) in the Utah State Publications, Utah Public Health Library Collections at the Utah Government Digital Library, accessed January 31, 2017, <http://digitallibrary.utah.gov/awweb/awarchive?type=file&item=35510>.

the Public Health Director for the city of Manchester, which is the largest city in the state New Hampshire. When it comes to flu, we learned quite a bit from 1918. We learned quite a bit from each epidemic, including the one in 2009. I want to share with you some of the challenges that we face, because sometimes we think we have really great ideas and plans, and when it comes to implementing them, we realize that maybe there are things we haven't considered. These are some of the questions I'm going to pose to you to consider.

First, though, I want to tell you *my* story of how I first learned about the 2009 epidemic. My daughter was playing travel soccer in the spring. It was April, and I was on a soccer field, and for whatever reason I parked near the fence. A stray ball came and took my windshield out. My windshield was shattered and the inside of my car was full of glass. I was on the phone with my insurance company when Doctor José Montero, who was Director of the Division of Public Health Services for the state of New Hampshire in 2009, called and said, "We're going to have an emergency conference call in 20 minutes." I was balancing between my insurance agent and José; José won. I did get a new windshield eventually.

Flu Basics

Let's talk a little bit about the difference between seasonal and pandemic flu, especially the potential impacts and some numbers. In particular, I want to take it down one more notch to the local level so you can see what some of the issues are that any local public health director would manage. Then, I want to talk about some of the strategies that we thought were really great, as well as some of the issues that we realized were going to be a problem.

To start, how do we get the flu and what happens when we do? Some of this is redundant, but it's important to know. How is influenza transmitted? In droplets, spread person-to-person. For this reason, we're always saying "try to stay three feet away from someone." Then there's indirect transmission. For example, you pick up a handset of a telephone, you handle a doorknob, and then you go back and touch your face.

Next is the incubation period. How long does it take to get sick? Probably one to five days. And when is a person contagious? A couple of days *before* symptoms become present. That's very important when we talk about isolation and quarantine as a strategy.

What about the impact on a community? To begin with, seasonal flu is a deadly illness. Every year about 36,000 people die in the US from influenza. Manchester, New Hampshire, has a population of approximately 110,000 and the hospitals serve about 180,000. About 21 people die from influenza every year in Manchester, and another 154 require hospitalization. We have two acute-care hospitals each with about 200 to 250 beds. I think, since the legislature cut some of their reimbursements, those numbers have gone down in the past two years, which is a problem. But, these are numbers that are easy to handle. We're not going to see all the patients all at once. We're going to see them over a period of time, but they're manageable in a regular influenza year.

Today, though, we keep talking about this term pandemic. I think any public health official during 2009 spent a lot of time talking about what pandemic means. Actually, technically, all the term pandemic does is refer to geography; it has nothing to do with severity. People hear the word pandemic, and they think something horrible is happening. I think Dora Mills mentioned that more than 200 countries had influenza cases in a matter of

months in 2009—that’s what determines pandemic; it has nothing to do with severity of illness.

How does a pandemic emerge? You may know that there are bird flus and swine flus, but how do either of them get to humans? Well, there are a couple of different ways. We did a lot of risk communication during H1N1, which was the pandemic influenza strain in 2009.³⁷ If I were a virus, there’s a couple characteristics I would want to have. I would want to be able to infect a lot of people, but I don’t necessarily want to kill them all, because if I kill them all, then my virus strain is going to stop. If I’m a virus, I want to be a villain. I want to be a bad guy. I want to be easily transmissible from person to person, but I don’t want to kill everyone.

So, transmission happens in one of two ways. The first is direct transmission of a non-human virus. Where do we see this? At the beginning of the H1N1 2009 pandemic, the first people to be infected had direct contact with poultry. That’s how they were getting infected. The genetic drift and shift that allowed humans to transfer this strain of influenza to other humans hadn’t occurred yet. It’s interesting because there are different types of flu viruses. There’s bird flu. There’s pig flu. There’s dog flu. There’s people flu... a little bit of everything. The first cases had to have direct contact with infected poultry. If you ever saw the pictures of some of the markets in Asia with the ducks hanging, and the birds, the live chickens everywhere, you know there were opportunities for exposure. In another case, maybe one or two years ago, we were concerned with a new strain of swine flu. It was coming from county fairs because people were chasing pigs. You would get in the pen and try to catch a pig, and some of the pigs had this particular virus. That caused direct transmission.

The other way that you can end up with a new virus, a novel virus that creates a pandemic, is that a human virus mingles with either a bird or swine virus, and creates a new virus. If the virus has the right characteristics—easily transmissible, virulent but not too virulent—then it has great opportunity. This new virus can take off very, very quickly, which we’ve seen happen.

What are some of the impacts? What do I worry about when we are talking about a pandemic? You heard some of these numbers earlier, they are the number of deaths. The 1918 Spanish flu pandemic probably killed between 20 and 40 million people around the world. Compare that to World War II, World War I, Ebola, SARS. The numbers of deaths from the influenza in 1918 were staggering.

SARS taught us a couple of interesting lessons; one was about health care workers. When SARS—a respiratory illness, a novel virus, a Coronavirus—struck, it taught us, especially in Toronto, that health care workers were the most susceptible for transmission, and that becomes important. The other interesting thing with SARS—Dora Mills talked about closing the bridge between Maine and New Hampshire—was that Manchester airport had direct flights from Toronto. All of a sudden we were thrust into a whole new world of international travel. I can’t tell you how many nights I stood at the airport. We had little cards to give people who had gone to Toronto. As people were coming in, I’d say something like, “Welcome to Manchester.” Then I would hand them a card that said, “If you get sick in the next five to seven days,” this is what you need to do. Additionally, we developed plans for what to do if there was a sick person on an airplane. Guess what? There are sick people on airplanes every day. They don’t all end up at the quarantine station at Logan or La Guardia

³⁷ “Risk communication” is the process of communicating information about risks, including those about public health risks.

airports, or anywhere else. Now, if you know Manchester at all, the airport is between the cities of Manchester and Londonderry. It's right on the line, and the authority is actually in Londonderry. Talk about a rift within the state! I only have legal jurisdictions in the city of Manchester, while Dr. Montero has state jurisdiction in Londonderry. My plan was to park the plane on the Londonderry side, and then I wouldn't have to deal with it. Dr. Montero's plan was a little bit different! You can really see the potential impact of a novel virus that is virulent, and the 1918 strain was virulent. We've seen much less virulent strains over time.

Managing the 2009 Influenza

After the H1N1 influenza strain appeared, the CDC came up with a program called Flu Surge. Essentially, it was a computer model that allowed you to enter demographic data, and then it would make projections. We got a copy of the program, and some of the assumptions that we built in for our particular model were that if you had true influenza, your length of hospital stay would be about seven days. About 15% of the people admitted would have to go to intensive care. The length of stay in the ICU was about 10 days, and about 7.5% of those people admitted were going to need a ventilator, because of the severe respiratory problems. These were some of the assumptions that we built into our program.

We also looked at a best-case scenario and a worst-case scenario. The best case was a six-week period when the flu would hit our community the hardest. For this, we projected 467 hospital admissions over and above the normal admission number. Now, remember we have about 400 beds. Motor vehicle accidents don't stop, heart attacks don't stop, ruptured appendices don't stop. Every hospital bed is pretty much full on a daily basis. Hospitals don't keep wards open in case something bad happens—that's a money loser. Hospitals operate in real time. We're looking at an additional 467 admissions in a best-case scenario; the worst case is 1,100 admissions. Then we looked at the total number of deaths and the logistics of someone dying from influenza. Funeral homes are funeral homes; once again, they can only deal with so many people at any given time. There were some real issues around these numbers.

What did we do to try and prepare? To try and get ready? Isolation and quarantine. We use the terms interchangeably all the time, but they are not the same. You isolate someone who's already sick. You quarantine someone who's been exposed to someone who's sick, but may not have developed the illness yet. Isolation and quarantine, in my opinion, will never work in a pandemic for two reasons. Number one: what did I say earlier about when do you begin to become infectious? There are one to two days before symptoms show up. How do I quarantine people who have been exposed to a sick person when the sick person doesn't know he or she is sick yet? It is almost impossible. Then, isolation is very, very difficult. You can do it on a very small scale, and even then it is hard to do. Isolation orders have to come from the state, but I've had to enforce isolation orders on a tuberculosis (TB) patient within the past year. Short of putting a cop outside the house 24 hours a day, it is almost impossible. He was a bread winner, and he was undocumented. He was on a construction job in Boston. So, he would get in a car in the morning, go to Boston, and come back. We would check with him and ask, "Were you here all day?" Of course, he said he was, right? It is almost impossible to track and to enforce isolation.

Also, if someone is under an isolation order, what about their family who may need to be quarantined? What if they need food? What if they are not handling it very well, and you have to provide some mental health services, clergy, whatever the case may be? Are all of those logistics lined up to support your isolation plan? Lots of times they aren't; sometimes they are. One of the great things about being at the local level is the connections that you make. For the longest time I served on the board of a homeless shelter in Manchester. They have a soup kitchen and food pantry. I would call and I'd say, "Hey, I need a couple of boxes of food, no questions asked," and they'd say, "All right, come over and pick it up." I'd be able to go over pick up food, and bring it to people under home isolation. That's not a bad system when it's one person.

It is not very practical, though; isolation and quarantine are not practical solutions. If I can't do it completely for one guy, I am not going to be able to do it for a lot of people in a pandemic.

To try and get a law enforcement officer to execute an order, to arrest someone who is not complying with an isolation order, is very difficult. In the case I just described, we had a patient who wasn't complying, so I ended up having two orders in my back pocket. One order said, "Let's go to the hospital voluntarily and get treatment." The other order said, "Let's go in the back of the sheriff's van, and lock you up." We went to visit the patient, and I had two vehicles outside, an ambulance and a sheriff's van. Fortunately, the person made the smarter choice of the two, but these are the realities.

There are a lot of issues with issuing quarantine or isolation orders. Who enforces them? Isolation and quarantine are really not practical.

So, we've reviewed community-based initiatives, non-pharmaceuticals, and we've heard about isolation and quarantine. Now, let's talk about social distancing—a good reason to stay away from people. It's an important factor to keep three feet away from folks. Don't go to public gatherings.

I also want to emphasize that public education is so important, especially with regard to social distancing and basic hygiene. I agree with both Nancy Bristow and Dora Anne Mills. People trust public health authorities at the beginning of an epidemic. As time moves on, people become less trusting, so the education piece is vital. It's not rocket science; we're telling you to "sleeve your sneeze" or "catch your cough." There are all these catchy phrases. Also, you need to wash your hands, singing the alphabet or something similar to make sure you do it long enough. Another tactic is to use hand sanitizer. I love hand sanitizer; it's my favorite thing in the world. These are public education tips that you give to people because they're pretty simple.

It isn't always easy to implement techniques, though. For example, think about social distancing again and come back to those funerals. What do you do? How do we mourn? We wake. We hug each other. We say, "I'm sorry for your loss." We get together. We eat together. How do I, as a local public health guy, say you can't do that anymore? I can, but it's very, very difficult.

What about other activities? After the Boston Marathon bombing in 2013, the Boston Bruins cancelled a hockey game, and look at the disruption that caused. We're talking about a bombing at a marathon, a terrorist event. Now, what if we're talking about the cancellation of a Bruins' hockey season because people are sneezing and coughing? If I'm a guy with \$4,000 invested in tickets, I might be a little miffed. Or, what about when common sense says stay home from work or school? Great idea. In Manchester, 52% of kids live below the poverty

line, and they get free and reduced lunch. OK, so if both their parents are working, what do we do with those kids? Keeping them home from school is great from the perspective of epidemic prevention, but it may not be a good idea for other reasons. This isn't 1918 when there was probably a woman at home in every household—a mother, a grandmother, someone. Today, our family dynamics do not support keeping kids home from school. It's a great strategy, but there are logistical issues with it.

Then there are the ethical issues that are linked to some of the logistical concerns. What about mass dispensing of vaccines or antivirals? Yes, we have plans to do that. At one point in time, when we thought the smallpox vaccine was going to be used again, we wrote all these plans about how we could treat someone with a vaccine or antiviral within a very short period of time. But, how are we really going to do it? Are we going to have the staff to do it? Also, people don't always want to come to work when things are bad. If there's a chance that they might get sick, they may not show up for work.

What about the ethics of who gets the vaccine? Who gets the antivirals? At a vacation place in Maine, there's a sign that says, "You never know how many friends you have until you have a beach house." Well, I believe you never know how many friends you have until you have a refrigerator full of vaccine. I get calls from people I've never heard from, saying, "Hey, could I have a little dose?" It's amazing, and there are some real ethical dilemmas there.

Here's another issue: who gets space in a health care facility? There are pictures from 1918 of beds lined up in gyms and other places as temporary hospitals, and we developed this great plan: We were going to create an acute care center, an ACC, with 100 beds in a middle school to use once the hospitals were full. That's awesome, but in a severe epidemic, 100 beds are probably going to be filled in an hour. We feel great because we've got the beds, and we've got these cool sheets, but there are issues with the ACCs—there are not enough beds.

There is another concern: the ethics when standards of care are going to be much lower. Does an ACC become a place where you go and die? You don't want to die at home, so you go there, but you're not going to get the same level of care. We don't have ventilators there. You're going to be lucky if someone walks around and changes the bedpan every so often. These are some of the realities that we face.

Then, after the epidemic, what about re-occupancy? If I used a middle school for my ACC, our families are not going to want to re-use the school as a school when everything is calmed down.

Moving away from the ACC issues. What about special populations? In Manchester, there are 70 different languages spoken in our schools. I'm not talking about common languages like French and Spanish. I'm talking about 70 different languages for which I need translators and written materials. That's not easy to pull off. Special populations include more than those who speak other languages. What about the elderly, the hearing impaired, and the physically impaired? Those with mental health issues? What do you do with them? Shelter in place? It's not a bad plan, if people will abide by it.

What about the whole community, during and after an epidemic? What would be the mental health status of our communities? Will there be continuity of operations? Can businesses still run? Will there be enough food out there? Anyone know how much food is in the state of New Hampshire on any given day? Three days' food supply. That's what we have; we're real-time-economy based.

Yes, I have concerns. I think a lot of folks have done a lot of great work, but we certainly don't have all the answers ready for the next pandemic. People always say, "It's not going to happen." But, it is going to happen. It's not a matter of *if* it will, it's a matter of *when* it will. It will happen again. We were lucky in 2009 because the influenza pandemic wasn't that virulent. It will happen again and the questions are: Is public health ready? Is health care ready? And, probably more importantly: is the public ready?

DISCUSSION QUESTIONS FROM THE AUDIENCE

Question #1: Did World War I exacerbate the spread of the Spanish influenza?

Response:

Professor Bristow: I'll confirm that everything Tim Soucy just said about prevention and preparedness is true. Here is a specific example that really brings it home: I was doing research in The Portsmouth Herald to prepare for today, because I wanted to have some local examples. The stories in the midst of the epidemic in Portsmouth were often on pages 6, 7, and 8. Sometimes, on the editorial page, there would be two sentences about influenza following a major editorial about the discussions for the peace after World War I. The flu was relegated to the back pages of the newspapers and of public attention, and that led to really bad decision making in some cases. For instance, the government did manage to slow one round of the draft once the pandemic was really underway, but because we had soldiers living in crowded and rough conditions in Europe, the US, and around the world, the war was a factor. The movement of troops around the world was a factor in spreading it. Things like the Liberty Loan drive (to encourage people to buy war bonds) that was concluding on November 11, 1918, led to parades. The peace (which started on November 11, 1918, too) also led to victory parades, and there were all kinds of meetings to raise money for the war. These were tremendously costly in terms of health. Even so, communities across the country employed some really smart and, as it turns out, effective public health measures. I think, even without the war, the influenza in 1918, because of the particular strain of the virus and what we now know about it, was going to be a problem. Could they have saved a lot of lives if we hadn't had a war? I'll turn it over to my colleagues because I actually don't know enough of the science to answer. Was the war a factor in what did happen? Absolutely.

Dr. Mills: I always think the corollary to your question is: Would we have had the Spanish influenza of 1918 if we hadn't had World War I? I don't know if anybody could really answer that. I do think it certainly would have been a different type of pandemic, because we know that those large troop ships were such a petri dish for the virus.

In addition, President Wilson had expanded the draft down to age 18—right in the group that was highly affected. All of those young men during the late summer and early fall were travelling from very remote places from all over New England, often going to Fort Devens, Massachusetts. Then there was a ship that came into port in Boston and landed at Fort Devens, and they had flu.

There were just thousands of men. You had Fort Devens with tens of thousands of people, mostly young men, and they were the age that was severely impacted. They were in

extraordinarily tight quarters. They wouldn't have been there if it hadn't been for World War I. Then, as the flu went through Fort Devens, to reduce the impact they actually discharged all these men back home. A lot of them seemed well when they left the camp. There were accounts in the Maine newspapers of trains arriving in Portland and Falmouth, and other places in Maine, with the passengers dead. Young men who had been sent home, and they died on the train. You just have to think that, yes, we might have had a pandemic anyway, but it would have been a lot different if we hadn't had World War I.

Mr. Soucy: I agree.

Professor Bristow: Also, we are still arguing about where the actual virus had its source. The best argument, as far as I can tell, is that it started in Haskell County, Kansas, and it's at Fort Riley, Kansas, a military installation, that the first cases appeared.

Question #2: What is the role of the media, and do members of the press hype things up?

Response:

Dr. Mills: The old newspaper saying is "if it bleeds, it leads." I think I found the media to be our best friends during H1N1 in 2009 and with many other public health issues because, as a public health official, you have to work very closely with them to get your message out and get it out clearly. Can it be hyped up? Sure. Can that be detrimental? Sure. You have to be very careful, but one thing we did during 2009, and many other public health emergencies, actually, was to have very frequent media briefings. That ensured that the media partners in Maine understood what was going on. The meetings were so that I could publicize my main point, but also I wanted to answer questions and help educate our media partners. That went a long way to making sure that they got the right sound bite and did a good job of covering it. You have to have relationships with the media in the world of public health. They are your best friends, but they can also be your worst enemies. I found that you have relationships and you build on those.

Mr. Soucy: If you don't establish those relationships with the media and give them information, they're going to find the next person to give them information—whether it's correct or not—or they'll make it up. That timely honest piece of information is so critical. If you remember after H1N1, there was a made-for-TV movie about this pandemic coming across the country. I was asked to go to the local TV stations and watch it with a few folks and then react to it. One thing I distinctly remember was that they had so many dead people that they were wrapping them up in plastic and loading them up into dump trucks, and burying them in open pits in landfills. The media can be responsible, and the media can be very irresponsible. When you start putting images like that in people's heads, it's very hard for the most honest, ethical public health people to overcome them. Fear is always more powerful than reality, and when those false, fearful messages get delivered, they're very hard to overcome.

Dr. Mills: I think it goes back to what Nancy Bristow was saying earlier, too: it's about being honest. When you are in public health, you have to be exceedingly honest with the media in terms of what you know and what you don't know. It was very important in 2009 early on in the pandemic when the data from Mexico showed that hundreds of young people were in the hospitals and dying. I don't know if that ended up being true or not—we do know that the impact was not as severe as we thought it could have been—but it was much, much

more severe than seasonal flu, and a lot of young people did die, and a lot of pregnant women died—a lot of hospitals were overrun in many other countries.

We had to be very careful and make sure that we clearly communicated, “This is what we know right now, but there’s a lot that we don’t know.” Also, you have to be careful to make sure you tell people what they can do to protect themselves. You can’t just keep saying, “We have 8,700 doses of vaccine for the entire state, and there are 625,000 of you who need vaccine right now.” We had to give people things to do, and we had to give updates about the vaccine. We also told the public that there are some things that everybody can do. You can make sure you wash your hands frequently. Cover your coughs either with your sleeve or your tissue, and stay home if you’re sick. I can still say those three things very quickly in my sleep. Everybody has something they can do, and that helps to empower people so that they are not overwhelmed by the fear.

Professor Bristow: I think there’s some onus on us, as the consumers. I’m actually not a public health person. I’m a professor of history. I watch these pandemics happen from the same seat that you, the audience, sits in. It’s OK if they tell us a possible epidemic could be worse than it ends up being. That’s part of my point that we have to educate well enough to help people understand the unpredictability of these things so that we prepare for that worst case scenario. It’s on us not to say afterwards, “Why did they say it was such a big deal and then it wasn’t?” The influenza is unpredictable. I’m up in the Northwest, and I’m impressed about how effectively they really did warn us about something before it happened, and we were lucky that time. I kept trying to tell people: consider ourselves lucky, not misinformed.

Question 3: What can everybody do? One of the things I noticed that ran through all three of your talks is the reality of inequality in epidemics. It’s true in other realms of our lived experiences as well. Obviously, a virus can kill anybody, whether you’re rich or poor, but poor people are going to suffer disproportionately. This is something that you’ve all addressed explicitly. I guess what I put out there—especially for the students in the audience—is to think about our role as citizens in demanding that no person is going to have to go to work when they are sick just so they can feed their children.

It is important that we have good public health education, which is just a huge challenge because I think everybody, on some level, knows to wash their hands, and yet we haven’t found a way to really create a culture of disease prevention awareness among adults and children. Not to go on and on, but those are the structural issues in our society.

I had wondered about international comparisons with countries with a greater social safety net where nobody is going to go hungry, or lose their job, or their house if they get sick. Do they have lower rates of infection in those kinds of countries? Again, this isn’t so much a question as a comment, but I would be curious to hear if anybody wanted to comment on that.

Response:

Mr. Soucy: I’ll just say two quick things. One is you can’t underestimate the social determinants of health. Health does not simply depend on whether or not you go to the doctor. There are a lot of underlying factors of social determinants of health.³⁸

³⁸ According to the World Health Organization, “social determinants of health are the conditions in which people are born, grow, live, work and age. These circumstances are shaped by the distribution of money, power and

The second is the point of having sick time. If you're the person who's in a minimum-wage job, and you either show up or you're fired the next day because there are 10 people waiting for that job, you're going to show up to work whether you're sick or not. Those are some of the hurdles we need to cross.

Dr. Mills: I should say that in Maine, we actually got criticized for putting out the message that you should stay home if you're sick; we got push back saying there are a lot of people who can't stay home if they're sick.

There is also the question about how to handle the demand for vaccine. I think that as a public health official you have to look at who is at the highest risk for severe flu and who fits the criteria specific to each kind of vaccine. In 2009, we had nine different types of vaccine, and each had different criteria that dictated to whom they could be given. Often the loudest advocates for the vaccine weren't people who were demanding the vaccine and writing letters to the editor and on TV saying, "We need vaccine." They're often the ones who didn't meet the highest need, and I can't tell you how difficult that is. I fortunately had been a state health official for years by then, so I had pretty thick skin, but it's tough. I would ignore it, but I would come home, and my husband would say, "Do you know how many people are criticizing you because you're not giving the vaccine to XYZ?" I felt that our ethical duty was to look at the data and advocate for those who often can't advocate for themselves. One example I remember is when I got an e-mail from a woman, a mother of a young college-age student who had cystic fibrosis. She was going to one of the University of Maine campuses. She said something like: "Dr. Mills, I know you're getting a lot of criticism right now because a lot of first responders are saying you shouldn't be giving the vaccine to young people, that you should be giving it to them first. I want to tell you my daughter is critical to me, and I'm so grateful. She will die if she gets this flu. I'm so grateful that she's getting the vaccine and the students around her as well, so she's got a circle of protection." It reminded me in the middle of it all that our job is to try to be as ethical as possible. It's to ensure that the distribution of the vaccine—or whatever our treatments and decisions are—is as fair and accurate and equitable as possible.

Professor Bristow: The part that makes that really hard, of course, is that we carry prejudices that we don't recognize. We're more attuned to certain kinds of fairness and we may be missing others. We have to be constantly interrogating ourselves about who it is in our society that is going to be most vulnerable in this context? Will it be an issue of economics? Will it be an issue of the ability to speak English? Or will it be because you have a pre-existing illness? What are those factors that make populations vulnerable? And again, this is why I'm glad you're in your seats and I'm in mine, because I think you run into some very, very complicated ethical questions. You have to be one step ahead of where society is in terms of its fair treatments of its citizens.

Dr. Mills: I'll just give one example. I don't want to keep going on, but we were very transparent. Every week we did a press conference and reported exactly where the vaccine was going. Not the actual addresses, but the populations and how much was going to each county, so people could see we were distributing it equitably, geographically by population. I will say that, although I didn't lie about it, I never said we sent a bunch of vaccines fairly

resources at global, national and local levels. The social determinants of health are mostly responsible for health inequities - the unfair and avoidable differences in health status seen within and between countries." "What are social determinants of health?" World Health Organization, 2016, accessed March 2017, http://www.who.int/social_determinants/sdh_definition/en/.

early on to the prisons, we just embedded it in the data by county. I wanted the jails and the prisons to be vaccinated, and if somebody had asked me about it, I would have told them. However, I knew that if I announced this decision we would get a lot of heat because we were vaccinating prisoners before a lot of other people on priority list. You never lie, but you don't always have to tell. You can tell the truth in such a way that you don't always necessarily unveil everything. I was prepared to take the heat. That was fine, but I didn't have to put it on the mark either by announcing, "Oh, and by the way, we sent 5,000 doses to prisons, jails, and youth detention centers this week." We just put it by counties.

Mr. Soucy: My biggest dilemma is that I work very closely with our police and fire departments on a daily basis. We began to vaccinate EMS in the city of Manchester, and the fire department rolls on EMS calls. If someone is in respiratory distress, the fire department goes. Well, we vaccinated firefighters but not police. Now, they don't like each other to begin with anyway. Once you start vaccinating one half and not the other half, it leads to upsets. I used to say that the police officers' ABC is "ambulance before a cruiser," so I actually used that against them so that I could put things into perspective for them.

Dr. Mills: On another note—I haven't read up on it recently—but we don't really know if pandemics do tend to hit younger people harder. The one in 2009, the one in 1957 and in 1968... one thing they have in common besides the viral shift is that they also hit young people, particularly pregnant women, much harder than others. It's not fully understood. I've heard some theories that maybe some of the older people have been exposed to something similar from years ago, so they have lingering immunity when a similar strain appears later. But that doesn't fully explain why in all these pandemics, it is primarily young people who are more severely affected. There's some part of physiology that I've read that did somewhat explain it, but not entirely.

Professor Bristow: I'll try to talk about the part of physiology here. The question was: Why did more young people die when it's supposed to be the young and the old? One theory is that it has to do with the immune response of healthy young adults, and is called a "cytokine storm." The problem is you have edema in the lungs, and many of these people are literally drowning in their own bodily fluids, the result of a powerful immune response to the virus. It is because the healthy have a better immune response, and so their bodies actually fight against them in addition to all of those other factors.

The other thing is that the research on the connection between the 1890 pandemic and the 1918 pandemic suggests that getting the former did not provide immunity for the latter. They've done quite a bit of study on where immigrants were from; who had been isolated and who had not; who had had the flu in 1890; and it doesn't seem to play out to have been a protection. That doesn't mean that the more recent influenza wouldn't have been a factor.

Mr. Soucy: Yes, and going back to the main question, it is really about the ethics of social justice versus health care justice, if I'm saying it correctly. I'll go back to what Dr. Mills said—I think you make the best decision based on the information that you have. Are there going to be ethical dilemmas on either sides of the equation? Absolutely, but I think if I'm basing my decisions on the science that I have in front of me at that time, then I can sleep at night. It's not always easy to make those decisions. Do you vaccinate all school age kids? Or do you vaccinate elderly folks?

Some people will say, and I'll be very harsh characterizing that point of view, that the elderly have led a good life, so why are we wasting the limited vaccine on them? If the data

suggests that's the most susceptible population, though, then from the public health perspective, that's where the vaccine should be going.

I don't know if we'll ever conquer some of the social justice and economic issues. I think we look at the data that's presented to us, and make the best ethical decision based that data.

Dr. Mills: I think you're absolutely right. During my 15 years as a state health officer in Maine, I don't think there was a day when I didn't deal with some sort of ethical issue. Public health is social justice; you can't separate the two. If you don't believe in social justice, please don't go into public health. I don't mean to be blunt, but that's the reality. You have to believe in that. With that said, particularly with an increasingly for-profit health care system, it gets complex. You get into some interesting dilemmas when you're working with a partner whose main mission is profit. It can be difficult, but there are also ways to work together. In 2009 we had a lot of pharmacists who were very upset that they didn't get the flu vaccine early on because they wanted to put it out there and market it. In some states, they gave it to the pharmacies very early and others said, "no, instead we are putting it into the schools." If we put it in places like schools then we are using a social justice strategy because we're getting all kids, rich and poor alike. You're getting the kids who live in the remote areas, whose parents do not have the gas or car to get to a pharmacy, you're getting everybody. We actually—we and the other New England states who used that strategy—had the highest vaccine rates in the country. Again, we were one of the very few states who did not have a child who died of flu in 2009. I think it had a lot to do with the fact that we put it in the schools.

We also had for-profit companies who helped us out. Once we had sufficient vaccine—around the third week of December—those companies offered to vaccinate all their employees, their employees' families, and anybody else. One company, during the week or two before Christmas when it was completely overrun with handling mail-order gifts, hired nurses on its own who went in and offered—24/7—vaccine to all of its employees and all their families. One company vaccinated more than 5,000 people, and one of the other big employers in Maine did the same thing, vaccinating more than 10,000. Those two employers are for-profit, but they also have a belief in "the common good" as a value. In other words, just because somebody is for-profit doesn't mean that they're bad.

Question #4: As we move more and more into a for-profit medical system, what are the implications for these ethical questions? They get harder, I suppose.

Response:

Mr. Soucy: There's actually been research on whom people trust. The question is: How do you maintain credibility with the media when, even in 1918, if you're not telling the truth, people aren't going to believe you? In the field of risk communication, there's been research that shows that people tend to believe health care officials more than politicians. It's been proven scientifically. I think that's probably one thing that we have to our advantage. That becomes very important when you decide who your public information officer is.

You need someone who not only can read the prepared statement, but also can answer questions honestly and ethically and openly to maintain the credibility moving forward. I'll tell you that someone did do that very thing in 2009. At the end of every press conference

he'd say, "This is ever changing, and what I told you today might be different tomorrow." You have to tell people that, it will help maintain your credibility.

Dr. Mills: I totally agree, and in many different types of public health scenarios, you want to have a variety of spokespeople. For instance, I have a lot of history with the tobacco war that is still ongoing. Very early on, I decided that I was not going to go on TV to talk about tobacco unless it was something about a bill and the legislature. If we were going to have people on TV, for instance, telling people to quit smoking, it needed to be a smoker—it needed to be a former smoker. It didn't need to be me. In fact it shouldn't be me. When there's a top-down approach, like preaching, telling people, "you should stop smoking," it doesn't work; it turns people off.

In a crisis, it may be different. I remember very early on in 2009, our media people in government said, "Dora, you're going to be the spokesperson." I said, "Really? Can't it be the governor or somebody else?" They said, "No, no, you do not want the governor." In fact, in some states they had the governor on quite a bit. In Maine, though, we had a communications director who was very savvy, and he said that it was not the right approach.... Anyway, it got tiring but it was also the right thing. That's when you want public health officials doing a lot of communication.

Question #5:

Professor Bristow: Can I ask a follow-up question? To what extent are you engaging with things like social media and some of the new ways of communicating? Is that a big part of what you do?

Response:

Mr. Soucy: We're getting there slowly but surely. I can't speak for Maine, but I think New Hampshire is a little behind the eight ball when it comes to social media. I think we still have a long way to go to capitalize on these new methods of communicating. We're starting, but I think we still have a long way to go.

Dr. Mills: I think that it was the spring of 2009 when we went on social media. We reassigned a lot of people at the Maine CDC (it used to be called the Bureau of Health) to work on the pandemic. We had this really hip young woman who worked in HIV and did a lot of social media on HIV—which you have to do if you're in HIV. We moved her up to do pandemic flu communications, and she immediately got us on social media. At the time, the big platforms were Facebook, Myspace, and Twitter. She got me plugged in so that we had several people who could post, and she set it up so I could post something, even in the middle of the night, and it would go to all of these Twitter feeds. It was the first time that I'd gone on Facebook. We did a lot of social media, and it was helpful because we were trying to reach a younger group. We weren't used to communicating about flu to 20 year olds. We were used to talking to senior citizens. We learned a lot of lessons from it.

CLASS EXERCISES

From the Past to the Present

Divide the class into three groups (or multiples of three). Each group should consider one of the following questions:

- What can we learn from the Spanish influenza to help us with annual influenza recurrences today?
- What can we learn from the Spanish influenza to help us with pandemics, in general, today?
- What can we learn from the Spanish influenza to help us with public health-preparedness educational initiatives today?

After each group has brainstormed, ask a representative from each one to share what the group recorded. Then, ask all the students to engage in a discussion: What are the differences in the answers to each question? Why? What are the similarities? Why?

Individual Views

Influenza pandemics encompass stories of medical challenges, political organization, and individual experiences. Ask students (as individuals or in small groups) to look up stories about personal experiences with the 1918 influenza in newspapers, either from your local area or around the country. How do these stories differ from one another? How might they be the same or different from experiences that people undergo today during an epidemic?

Priorities in a Crisis

Divide the class into groups, each one representing a state. If each group had two weeks' notice that there was a flu pandemic coming to its state, what would it prioritize out of the following list?

- Vaccination, education, isolation, preventative supplies (masks, etc.), treatment (such as antivirals), hospital and medical care
- In what order?
- What could you do quickly? What would take longer?
- Why would you make those choices? Are you hoping to cover certain populations? What would be the most effective measures? The most just? The quickest to implement?
- If you had a limited number of vaccines, which groups of the populations would you seek to cover first? Make a list of your top three and explain why. (For this exercise,

assume that any vaccine will be appropriate to use on any individual and that you can cover 90% of each group you choose.)

ABOUT THE AUTHORS

Nancy Bristow is a teacher and scholar at the University of Puget Sound where she has been a Distinguished Professor for 11 years. She earned a BA from Colorado College and an MA as well as a PhD from the University of California at Berkeley. She published a monograph on the 1918 Spanish influenza entitled *American Pandemic: The Lost Worlds of*

the 1918 Influenza Pandemic with Oxford University Press in 2012.³⁹ That book was made possible, in part, by a grant from the National Endowment for the Humanities.

Dora Anne Mills has served as the State Health Officer and then the Director of the state's Center for Disease Control in Maine. She was raised in Maine and earned a BA from Bowdoin College, her medical degree from the University of Vermont College of Medicine, and her masters of public health degree from Harvard. Before she focused on public health, she practiced medicine in the US and abroad. In 2010, the American Academy of Pediatrics gave her a Special Achievement Award, and the Association of State and Territorial Health Officers gave her the McCormack award for her work during the 2009 H1N1 influenza epidemic.⁴⁰ She currently works as the vice president for clinical affairs at the University of New England (UNE).

Timothy Soucy is the Public Health Director of the Manchester Health Department in New Hampshire. In this role, he was instrumental in the development of Manchester's Pandemic Preparedness Influenza Plan. (Manchester, New Hampshire, represents approximately 10% of the state's population and is the largest city in the state.) Mr. Soucy manages the current challenges of maintaining the health of the state's most ethnically and racially diverse population in the face of a potential flu pandemic. He grew up in New Hampshire, earned a BS from the University of Vermont and an MPH from Boston University. He has additional training from the US Food and Drug Administration, Centers for Disease Control and Prevention, and Department of Homeland Security. Over the course of his career, he has focused on specialized areas in public health including environmental health and public health preparedness.⁴¹

Chapter 81

THE DILEMMA OF TYPHOID MARY: PERSONAL LIBERTY VERSUS PUBLIC HEALTH

*Judith Walzer Leavitt**

INTRODUCTION

Professor Leavitt presents the story of an Irish immigrant woman in New York in the early decades of the twentieth century who was the first identified healthy carrier of typhoid, a potentially fatal disease, in the US. Healthy carriers are people who have recovered and are no longer sick with the disease but who can nonetheless still transmit it to others. Mary Mallon was, and is, well known by the name “Typhoid Mary,” a label that reduces her identity from that of an individual to that of a disease. She became a symbol for issues that confronted society both in her time and today, including decisions about what takes priority: individual liberty or public health. How did (and should) officials treat individuals whose health status threatens others? Was Mary treated justly? And how can we ensure that people in her position are treated justly today?

LECTURE

I am assuming that many of you have heard of Typhoid Mary, a woman whose real name was Mary Mallon. But even if you have heard of her, you will not necessarily know her full story. Today, I am going to discuss that story and some of the issues it raises.

Typhoid Mary was, and is, infamous. Almost any history of twentieth-century America will include something about her. Very frequently, it will not be completely correct, but at least she will be mentioned.

She is usually portrayed as a dangerous woman—don’t eat what she cooks or you might become ill and die. In one contemporary illustration there is a big shadow behind her, a sign

* Judith W. Leavitt, “Medical History & Bioethics,” University of Wisconsin-Madison, 2016, <https://medhist.wisc.edu/faculty/leavitt/index.shtml>.

that something is amiss with her. Another popular idea was that she shed germs wherever she went; there is at least one illustration in which those germs are shown falling off of her. Otherwise, she appears perfectly benign in that drawing, but that is part of the danger she poses—she looks benign, but she is not. You do not want to get near her. It has nothing to do with her sneezing and coughing all over you. The message is clear: just to be close is to be in danger.

To tell the story of Mary Mallon is to tell two stories: that of Mary Mallon and that of Typhoid Mary. These two tales help us to understand the contest of individual liberty versus the public health, two values that are very important in our culture, but which, at times, come right up against each other, forcing one to yield—the question is: Which one and by how much?

The other big question is that of justice. Through Mary's case we learn that justice is not always applied equitably. What we want to conclude—but cannot fully answer even today—is this: Can we protect the public's health without trampling on individual rights? This, surely, is the key question, and not merely a historical question—these issues occur in our time as well. For example, consider the case of Andrew Speaker. In 2007 he was diagnosed with multidrug-resistant tuberculosis (TB). But Speaker had destination wedding plans and so flew on an airplane, and thus exposed several individuals to a hard-to-treat form of TB. Should he have been allowed on to the plane? Could we, morally, have prevented him from boarding?

Now, let's return to typhoid fever. What is it? It is a bacterial infection with systemic, flu-like symptoms, fever, headache, and gastrointestinal issues caused by the *Salmonella typhi* bacterium. It is transmitted via food and water contaminated with the feces or urine of patients and carriers. Think about that: How does something that is in the feces or urine of one person get into the food of another person? Because the carrier prepares and serves food with unwashed hands. The disease can be transmitted by somebody who is ill but also by somebody who has been, but is no longer, ill...somebody who is a healthy carrier.

Mary Mallon

Mary Mallon was an Irish immigrant born in 1869. She came to the US in the 1880s, and found work as a domestic servant, and ultimately, as a cook. In the domestic hierarchy of her day, cooks were at the top of the ladder and Mary was proud of her skill and her position. She worked with various employment agencies in New York City and rarely went without a job.

She often cooked in the homes of very rich New Yorkers, sometimes living in servants' quarters in their homes, sometimes coming in on a daily basis.

In the summer of 1907, the family for whom Mary was working took her with them to Oyster Bay, Long Island, a summer resort frequented by fairly rich people. They had rented a house for the summer and Mary was to come out and cook for them. During the summer, some of the family became sick with typhoid fever. In the early 1900s typhoid fever was a common disease, and so, while obviously dismayed by the illness, the family was not unduly surprised.

The owners of the house, however, were afraid they would never again manage to rent it because it would become known as a house that somehow carried typhoid fever. They hired various people to look into the problem, among them, George Soper. Soper was a sanitary

engineer. He checked the cleanliness of the house and looked at the water supply. He also checked the clams in the bay to see if the seafood was contaminated. Yet, in all of his searches he could find no evidence of the bacterium and nor did anyone else in Oyster Bay fall sick with the disease.

This is the way George Soper tells the story, and I have to believe it, at least in part: He remembered reading that two years earlier a German physician, Robert Koch, had identified healthy people as possible carriers of typhoid fever—people who had recovered from a disease could sometimes continue to carry the bacilli somewhere in their gastrointestinal tract; usually it could be found in the urine or feces.

Once he remembered this article, Soper decided to find out if there was such a person involved with this particular outbreak. His interest focused on the cook. Since the typhoid outbreak, Mary had left the family's employ and gone to cook for another family. Soper went to all the employment agencies and ultimately found her. He wrote: "I had my first talk with Mary in the kitchen of this house... I was diplomatic as possible, but I had to say I suspected her of making people sick and that I wanted specimens of her urine, feces and blood."¹

Now, just stop for a minute. What would it feel like to have a complete stranger, not a person in authority, not a member of the Health Department or the government, turn up in your kitchen and say, "I want feces, urine, and blood from you." Needless to say, Mary was not happy, as Soper put it. She came at him with a carving fork, and chased him out of the house. Soper, however, would not give up. He tried to get to her a few times. And, all the while, Mary became angrier and tenser and more and more worried.

Finally, when Soper could not get her to come with him voluntarily, he went to the Health Department and reported that he thought she was a carrier of typhoid fever. In turn, the Health Department decided to go after her and see if it was true. They selected S. Josephine Baker, a physician and health inspector with the Health Department. Choosing a woman to go after a woman was one of the few humane things the Health Department would do over the course of Mary's story.

Baker went to Mary's place of work but could not find her. Indeed, in an act of class solidarity, none of the servants would tell her where Mary was, and so Baker searched and searched. She had five policemen with her. They searched the house. They went up into the attic, onto the roof, into the basement, everywhere. There was no sign. And then, just as they were giving up and preparing to leave, they spied a little piece of blue cloth sticking out of a door. They opened the door, and there was Mary Mallon. She had been there for hours, cowering in the corner.

They took her with them, but as Baker put it, "She came out fighting and swearing, both of which she could do with appalling efficiency and vigor. I made another effort to talk to her sensibly and asked her again to let me have the specimens, but it was of no use. By that time she was convinced that the law was wantonly persecuting her, when she had done nothing wrong." Baker continued, "There was nothing I could do but take her with us. The policemen lifted her into the ambulance and I literally sat on her all the way to the hospital; it was like being in a cage with an angry lion."² It is not hard to imagine that by now Mary was really upset; she wanted nothing to do with this, and so they took her away forcibly.

¹ George Soper, "Curious Career of Typhoid Mary," *Bulletin of the New York Academy of Medicine* 15 (October, 1939): 704 quoted in Judith Walzer Leavitt, *Typhoid Mary: Captive to the Public's Health* (Boston: Beacon Press, 1996), 43.

² Josephine Baker, *Fighting For Life* (New York: Macmillan Co., 1939), 74 quoted in Leavitt, *Typhoid Mary*, 46.

Mary was taken to Willard Parker Hospital, a New York hospital for contagious diseases, and she was put in bed. She was a healthy 37-year-old woman who had been doing her job, and they took her forcibly and put her in bed.

After a while at Willard Parker Hospital, Mary was moved to North Brother Island on the East River, a tuberculosis retreat. Here, there was a small tuberculosis hospital with nurses' quarters and doctors' quarters. They gave her a bungalow on the island, put her in it, closed the door, and went away. Every morning, apparently, somebody would bring a tray of food to her front door and run away as if just looking at her would infect them. She was really alone. Eventually she would make some friends among the patients and some of the nurses, but there she stayed for the rest of 1907, through 1908, and into 1909.

When, in 1909, the *New York American*—a William Randolph Hearst newspaper—broke the story of how the Health Department had been holding Mary all this time against her will, they called her “the most dangerous woman in America.”³ There are various images of Mary accompanying the story, but there is one drawing of particular interest. It shows Mary in 1909, when she was 39. In the artist's vision, she is fairly young and well dressed. Her hair is done up. She has an apron. She is a cook. But there are signs that she's not all sweetness and light. Her face is a little dark. The hair on her arm is pronounced. She is holding a skillet into which, instead of eggs, she is breaking skulls. In other words, she is not only killing people but is doing so wantonly and intentionally.

Figure 1. A Menacing Typhoid Mary. *New York American*, 1909, image available through Wikimediacommons.org at https://commons.wikimedia.org/wiki/File:Mallon-Mary_01.jpg#filehistory.

³ *New York American*, Sunday magazine sec., June 20, 1909, 6–7 quoted in Leavitt, *Typhoid Mary*, 132.

Curiously, the newspaper's story is actually very sympathetic. It tells of a woman who was doing her job, walking down the streets, living her life, when the Health Department grabbed her and took her in, and had kept her ever since. But the picture was very powerful, and despite the story, it was that image that lingered.

The officials continued to assess Mary, even as the public learned about her. Every other day, or at least three times a week, they took her feces and urine to test. There is a record of all these tests and she tested positive most of the time. However, the results were sometimes negative, and the Health Department concluded that she was an intermittent carrier (which many typhoid-fever carriers are). Of course, when her feces tested negative she could not transmit the disease, but from their records it is evident that most of the time she could.

Now, Mary was a smart woman. She decided that the Health Department lab may not have been acting in her interest, so she sent samples of her feces with her boyfriend down to a lab in Manhattan. There were not many samples, but every one of them tested negative... every single one.

At that point, Mary must have said to herself, "The Health Department is creating a case against me that isn't true because I now have scientific, laboratory proof—just like theirs—that my feces are not carrying live bacilli." Of course, with hindsight we realize that we know nothing about the samples: When were they delivered? How old were they? How often had her boyfriend visited her? How often had she given him samples? How long did it take him to get them to the delivered? It is very possible that they were negative samples simply because any germs within them had died by the time they reached the lab. Still, Mary was convinced that the evidence proved her innocence.

This is how she put it: "There was never any effort by the Board authority to do anything for me excepting to cast me on the Island & keep me a prisoner."⁴ Her perception was that "I have been in fact a peep show for Every body even the Internes had to come to see me & ask about the facts already Known to the whole wide World[.]"⁵ This quote is from the only letter extant in Mary Mallon's hand. It is five pages long.

It is clear that Mary was very sensitive to the stigma that was attached to her through the title of Typhoid Mary. She says, "Dr. Parks [sic] has had me Illustrated in Chicago." In other words, he gave a talk at the American Medical Association [AMA] meeting, and he had slides. Mary continues by stating, "I wonder how the Said Dr. W[ilia]m H. Park [the director of the Health Department's laboratory] would like to be insulted and put in the Journal & call him or his wife Typhoid William Park."⁶ She knew what the officials were doing, and she knew that she had very little power against the Health Department's efforts to portray her as dangerous.

As it turned out Mary picked on the wrong person. William Park was really very sympathetic to her situation. But, he was merely a bacteriologist in the Health Department; he was not the commissioner and had no power. Still, Park said one day: "Has the city a right to deprive her of her liberty for perhaps her whole life?"⁷

⁴ In the Matter of an Application for a Writ of Habeas Corpus for the Production of Mary Mallon, New York Supreme Court (June 28–July 22, 1909) in the New York County Courthouse quoted in Leavitt, *Typhoid Mary*, 185.

⁵ Ibid. quoted in Leavitt, *Typhoid Mary*, 187.

⁶ Ibid.

⁷ William H. Park, "Typhoid Bacilli Carriers," *JAMA* 51 (September 19, 1908): 982 quoted in Leavitt, *Typhoid Mary*, 47.

In 1910 a new health commissioner was appointed, Ernst Lederle. At last there was someone in power who was sympathetic. He said, "For Heaven's sake, can't the poor creature be given a chance to live? An opportunity to make her living, and have her past forgotten? She is to blame for nothing—and look at the life she has led."⁸

With the help of a *pro bono* lawyer Mary had sued for release in 1909, but it was not granted. Basically, the judge said, "Look. You are a carrier, you are dangerous to public health. The Health Department calls you a menace to the public's health. We can't let you out on the street." She was returned to North Brother Island, and there she stayed until Lederle came in 1910 and let her go. As he put it, "She has been released [now] because she has been shut up long enough to learn the precautions that she ought to take."⁹

Most public health people at the time agreed with him. They realized that it is not necessary to imprison a typhoid fever bacillus carrier. It is sufficient merely to restrict their activities. If you can prevent her from cooking, find her some other work, then it is safe for her to be walking around the streets. Lederle found Mary a job as a laundress in a laundry. It was a position far below that of cook—both in status as well as pay—and Mary was not happy. But, she did it for quite a while. Then, she went on to other work, and eventually returned to cooking, this time in a maternity hospital where she was tracked down in 1915. She had been out for five years, but now she was returned once more to North Brother Island.

And this, for me, is when the story gets really interesting. George Soper put it this way: "Whatever rights she once possessed as the innocent victim of an infected condition...were now lost. She was now a woman who could not claim innocence. She was known—willfully and deliberately—to have taken desperate chances with human life... She had abused her privilege; she had broken her parole. She was a dangerous character and must be treated accordingly."¹⁰

Second time around, public opinion was quite different. People who had once been sympathetic lost patience. She had gone back to cooking and more people had become sick with typhoid fever. Now, her one-time supporters said, "No, you're going back in and you deserve to go back in." One historian put it this way: "Consider that Mallon disappeared for five years [which she didn't—the Health Department actually kept in touch with her for most of that time], and used several aliases [which is true; she changed her name to Brown at least among other names] and went back to cooking... Now as far as I am concerned, this verges on assault with the possibility of second degree murder. Mallon knows she carries typhoid, knows she should not cook—and does so."¹¹

There is a point here. If you have somebody who willfully does not do as instructed by the Health Department, then the Health Department's authority over that person seems more valid, more solid. But that is not how Mary Mallon saw it. She said, "Before God and in the eyes of decent man my name is Mary Mallon. I was christened and baptized Mary Mallon. I lived a decent, upright life under the name of Mary Mallon until I was seized...[and] rechristened 'Typhoid Mary.'"¹²

Other Carriers

These are the issues: How far can the state infringe on personal liberty? Whose liberty historically has been abridged in the name of public health? I looked for other healthy carriers in New York City and tried to see how Mary's story matched theirs and what was really going on.

One comparison I found was Alphonse Cotils, a Belgian immigrant. (Almost everybody I found was an immigrant, which is, in itself, interesting.) Cotils was a baker and a healthy carrier of typhoid fever. He was found to be transmitting disease through the food he prepared in his bakery—usually the icing on the cookies and tarts he made. When he was taken, he said to the newspaper, “I am not a Typhoid Mary...I always wear a white coat and a white hat and white working pants. I am a clean man.”¹³ This, then, is the contrast—even Mary's fellow healthy carriers disowned her by saying, more or less, that “she was dirty and she deserved what she got, but me, I'm pure.” The judge agreed with Cotils. He wrote, “I am thoroughly impressed with the extreme danger from these typhoid fever carriers, particularly when they are handling food [just as Cotils was. But] I could not legally sentence this man to jail on account of his health.”¹⁴ So, there is Mary Mallon sitting on a North Brother Island, and yet Alphonse Cotils goes free.

Another carrier was Tony Labella who had actually caused typhoid fever in many more people than Mary Mallon had. He was an Italian dairy worker. In the early 1900s, raw milk was sold loose and handled without much care. If handled by a healthy carrier, it could easily be contaminated and carry disease to many people. Labella infected 122 people, killing five of them. Yet, the Health Department isolated him for two weeks and then released him. Whereupon, he did it again. Here, then, is another case of a repeat offender—just like Mary Mallon. However, unlike Mary, the officials again released Labella and found him a job. He was never heard from again, so, presumably, that time the warnings worked or he may have moved out of the jurisdiction of the New York City Health Department.

Then there was Fredrick Moersch, a German immigrant confectioner—he sold ice cream. A healthy carrier, he was described as being well disposed and quite amenable. He was temporarily isolated, and in his record the Health Department wrote that he was worthy of special note: “His wife is not in good health and cannot help with earning money. They have four small children... He is a skilled workman, and...he was suddenly excluded from work in his trade.”¹⁵ To all intents and purposes, he was a male Mary Mallon, and yet the Health Department let him go but followed him. Because of the Mary Mallon case, the Health Department had a new regulation concerning the following of healthy carriers, and Moersch was required to register with the city at least once a year. Thus, with most healthy carriers, the Health Department showed sympathy and gave help. They simply required regular registration with address changes, and they informed all carriers that they should not cook for anybody.

In Chicago, I found an interesting case of a woman named Jennie Barmore who ran a lodging house and cooked for her lodgers, and in the process, transmitted typhoid fever to

¹³ Cotils in Gene Fowler, “Health Board Bars Robust Baker, Typhoid Carrier,” *New York American*, March 14, 1924, p. 13 quoted in Leavitt, *Typhoid Mary*, 162.

¹⁴ *New York Times*, March 15, 1924, p. 19 quoted in Leavitt, *Typhoid Mary*, 58.

¹⁵ Memo from G.L. Nicholas to Director of the Bureau of Infectious Diseases, Department of Health, February 14, 1916 quoted in Leavitt, *Typhoid Mary*, 122.

them. The Chicago Health Department essentially put her under house arrest and said that, while she could stay in her house, she could not take in more lodgers. She could not even feed her children, but she was not taken into any custody. How different from the isolated, stigmatized Mary Mallon.

Justice Denied?

While I cannot go into it all here, my research reveals that class, ethnic, and gender issues helped to construct the response to Mary Mallon's case. But if there is a discriminatory pattern in the justice meted out, then surely there is no justice. The question that must be asked, therefore, is this: What criteria did the Health Department use in Mary Mallon's case that they did not use in other cases?

There is much in the records of both the Health Department and George Soper that indicate that they were not just interested in Mary's status as a healthy carrier of typhoid fever. There were other things they did not like about her, things to do with her gender, class, and immigrant status. They justified taking her: she was tall; she was too heavy; she had a determined mouth and jaw—all things that were completely irrelevant to her being a carrier. Soper went even further: "Nothing was so distinctive about her as her walk, unless it was her mind. The two had a peculiarity in common. Mary walked more like a man than a woman and...her mind had a distinctly masculine character, also."¹⁶

And so, Mary Mallon spent the rest of her life on North Brother Island. She had arrived in 1907, was released in 1910, returned in 1915, and stayed until her death in 1938. At the time of her death, her public image was just as it had ever been: she remained a dangerous character, "Typhoid Mary," someone to be avoided. There is one image in which Mary is bringing tea; following in her wake is a host of pathogenic bacilli; she appears to be very malevolent. Clearly she is putting something into the food of the sick persons behind her—she is deliberately infecting them and looking on as they suffer. This is how Mary Mallon, Typhoid Mary, is remembered.

But how did this happen? Clarence Darrow, the lawyer who defended Jennie Barmore in Chicago, believed that health officials were permitting "one carrier complete liberty to go about in his usual manner...while another may be confined under the strictest quarantine."¹⁷ He was arguing that Jennie Barmore should not be contained simply because officials were saying, essentially, "If you let her out she's going to cook again, that's what women do. You can't stop a woman from cooking, and therefore women, more than men, must stay in quarantine."

This was Darrow's interpretation of how health departments viewed carriers, and if you look at the regulations of the time, they were sufficiently vague to be so interpreted. Indeed, they were so vague that a health department could label one person a danger to public health and another—to all intents in the same condition—as no danger to anyone. One person can be trusted, but not the other; one person can be allowed out, but not the other. Clarence Darrow pointed out that this is capricious. It was really up to the Health Department's whim—if they

¹⁶ George Soper, *Curious Career*, 698 quoted in Leavitt, *Typhoid Mary*, 106–107.

¹⁷ *Illinois ex rel. Barmore v. Robertson*, 302 Ill. 422 (1922). Quotation from the Application for Rehearing, 9 quoted in Leavitt, *Typhoid Mary*, 124.

did not like somebody because she walked too much like a man, then they could just arrest her and keep her isolated. Darrow was trying to make the case that the law had to be clear and more fairly applied. He was not arguing against isolation *per se*, but rather, that if you were going to isolate, you had to do so fairly and equitably, and I agree.

As I said before, there is every reason to believe that Mary Mallon was smart. She understood that there were two kinds of justice in America. She said, "All the water in the ocean wouldn't clear me from this charge, in the eyes of the Health Department. They want to make a showing; they want to get credit for protecting the rich, and I am the victim." She also said, "I will get justice somehow, sometime."

Maybe it is up to us to give her that justice.¹⁸

There are, essentially, two different perspectives in this story. On the one hand we have the Health Department saying that Mallon posed a threat to their efforts to preserve the public health. On the other, we have Mallon herself, saying the health officials were persecutors who unfairly took away her identity (by changing her name), her independence (by locking her up), and her ability to earn a living. The "unfairly" part you can debate, but the rest was true—they did take away her identity, she was never again called Mary Mallon, she was Typhoid Mary, and this most certainly took away her independence and her ability to earn a living.

One of the lessons, one of the important lessons, is to understand how labeling people can affect a story. Mary Mallon was identified not just as Typhoid Mary, but also as someone who was dangerous to public health. It was a dehumanizing stigma. It said, "We can do this to you. You're over there. We are not dangerous to the public health, but you, over there, you are dangerous."

To be able to identify someone that way is to have control. Mary was, as she put it, banished like a leper simply because the Health Department had the authority to banish if they wanted to. The label, and its associated stigma, surely affected ensuing events and made controlling the disease more difficult. Mary's back was up right from the start and she was in no mind to cooperate. She was angry and frustrated; in the ambulance Mary was like a caged lion. Perhaps if the authorities had treated her differently, had not been so swift to stigmatize and isolate her, she might have acted very differently.

Behavior labeling has far-reaching consequences. As Jonathan Mann, head of the International AIDS Center in the 1990s, said, "Stigma and discrimination are the enemies of public health."¹⁹ The phrase sums it up very well. Stephen Joseph, a New York City health commissioner in the 1980s, said, "The issue...is not whether quarantine is a legitimate tool for protecting the public health,"—which he agreed it was—"The issue is: Under what circumstances should it be employed, and with what safeguards against its abuse?"²⁰ And that is, indeed, how we have to think about Mary Mallon's case. To put it into a contemporary setting, think about AIDS sufferers in Cuba where the initial response was to isolate anyone who tested positive for HIV. Some of the victims have said, "It is very difficult to be just sitting here waiting to die. We have lost our freedom; that is the most important thing there

¹⁸ *New York World*, July 20, 1909, 18 quoted in Leavitt, *Typhoid Mary*, 183.

¹⁹ "Preface," *The Impact of Homophobia and Other Social Biases on AIDS* (San Francisco: Public Media Center, 1995), p. 3 quoted in Leavitt, *Typhoid Mary*, 237.

²⁰ Stephen C. Joseph, "Quarantine: Sometimes a Duty," *New York Times*, February 10, 1990, 15 quoted in Leavitt, *Typhoid Mary*, 237.

is.”²¹ When she was out on the island, Mary Mallon was asked, “We take good care of you. We feed you. You have a bungalow. What are you complaining about?” She said, “How about my freedom?” It was as simple as that.

Sandor Katz, another AIDS activist in the 1990s, said, “Given the stigma of AIDS and the vulnerability of the groups hardest hit by it—gay men, drug addicts—there is an ever present danger that the public health officials will trample on civil liberties in their zeal to do something.”²² This raises a specter of discrimination in employment, housing, health insurance, etc. Katz understood that if the sufferer is unlike you in some way, it is easy to say, “OK. OK. Yeah, we can isolate you.” But what if the issues apply also to you, to me, to all of us?

It is important to ask: Was Mary Mallon, in some way, to blame for her treatment? Did she consciously bring sickness and death? Was she the demon, breaking skulls? Was the Health Department to blame? Did it act too quickly and without sensitivity to Mary Mallon’s situation? The easiest answer is that they shared the blame, right? The Health Department, however, had the power in this situation, and therefore I believe that makes their blame a little more significant than Mary’s blame.

When my book about Typhoid Mary was published, I was criticized for being too sympathetic to her. I was sympathetic to her, and I still am. I am sympathetic to anybody who gets caught in a machine as powerful as city government, state government, federal government. It is too easy to get caught in a way that makes your behavior look worse. As Mary Mallon lashed out against it, she became the one who was, and is, blamed more; government behavior is rarely criticized because they are the ones in authority; they define the situation.

Thus, in the end, I conclude that the Health Department was more to blame. George Soper’s presence muddies the water because he was not part of the Health Department, but he was the first one to get to Mary. It is Soper who comes to her and he says, “I want your blood, feces and urine.” If somebody came to your door, you wouldn’t give him those, would you? You’d be upset. So even before the Health Department was part of the story, Mary was upset. But did she have reason to be? And should her reaction have influenced the officials’ treatment of her?

I ask the question, “Have we been too quick to override individual liberty with the perceived larger good of protecting the public’s health?” I think we need to pay attention to the injury that was caused by the stigmatizing labels and “othering.” We need to apply public health equitably—much easier to say than it is to do—but I think it is really important to think about providing fairness in our public health policy. We need to develop a trusted system that does not discriminate. We need to educate the general public to lower risk behaviors. And, indeed, that is what the Health Department has been trying to do throughout the twentieth century and into today.

We need to gain public cooperation, not resistance. In recent years there has been a big push for health departments to try to figure out ways to build cooperation in the community so that if something were to happen, people would not just get angry and say “no.” Instead, they would try to work with the authorities to make the situation better.

²¹ Tim Golden, “Patients Pay High Price in Cuba’s War on AIDS,” *New York Times*, October 16, 1995, 4 quoted in Leavitt, *Typhoid Mary*, 242.

²² Sandor Katz, “HIV Testing—A Phony Cure,” *The Nation*, May 28, 1990: 738–42 quoted in Leavitt, *Typhoid Mary*, 239.

Perhaps we should use isolation only as a last resort, although in cases such as SARS (Sudden Acute Respiratory Syndrome) you do have to act very quickly. In a case like SARS, officials might need to resort to isolation more rapidly, but the isolation should be temporary. Regardless, we always have to pay attention to due process and, of course, in Mary Mallon's case, there was none.

Historically, I can see that immigrants and racial minorities have experienced the greatest inequality from health policies. If you look into public health anywhere in the US in the late nineteenth and way into the twentieth century—probably even today—you will see that the people most likely to be caught in the system, are people like Mary Mallon—immigrants, racial minorities, women—and all have fewer resources with which to defend and protect themselves, to ensure that they receive due process.

CONCLUSION

Is the protection of public health a higher national priority than individual rights and the liberty of the stricken? I think they are both very strong national priorities, and because of that we continue to struggle with the dilemma. But, justice must always be in our minds as we consider these issues.

Finally, we must always think of these issues as if they apply to *us*, not just to *them*. For only by placing ourselves in the dilemma, will we ever be able to achieve justice.

Discussion Questions from the Audience

Question #1: I was wondering if Mary talks about facing discrimination even before the health officials discriminated against her? Was she discriminated against in other ways—in employment or anything like that?

Response: She doesn't talk about that all.

Many immigrant women did feel they were at the lower end of the work world and didn't like it there very much, but no, I never came across that from her.

That said, she sees it so clearly in the medical case that she must have understood or felt discrimination in some way earlier, she just never talked about it. I think people had a view of the world from their own position in it, and she was at a lower position. She understood that most of the other people she dealt with—employers or the government in this case—had a lot of power that she didn't have. At some very basic level she understood that or she wouldn't have been able to make that connection. But whether she ever consciously made it earlier, I just don't know.

Question #2: Did she feel responsible for the typhoid patients around her?

Response: To her employers, absolutely, she felt a responsibility. In fact, when people got sick in the houses where she cooked, she stayed around and took care of them and so, of course, made it worse. It could be interpreted that she felt responsible for making them ill, but

I think she saw it as her responsibility for other reasons. She was always thanked by her employers for being so loyal and kind and taking care of the people who were sick in the house. Yes, she felt that responsibility very much. But, did she feel responsible for giving them the sickness? No. She never felt that.

Question #3: Did Mary understand the science used by the Health Department?

Response: One of the things that happened on the island after she was isolated the second time is enlightening. Mary was always applying to do some job, and they finally gave her a job in the island laboratory checking TB sputum samples to see if they were active tuberculosis. Now, Mary didn't believe in bacteriology, certainly didn't believe she was a carrier—after all, she kept saying, “How I can be dangerous to anybody? I'm not sick”; she had accepted that if you were sick, you might give a disease to somebody, but she never accepted that if you were healthy you might give the disease to somebody. Yet there she was, working in a lab.

She was very much a woman of her time. Most people in America at that time didn't believe that a healthy person could make another person sick. Intuitively, it just didn't make sense, and it took a lot of convincing even among physicians. I have found many contemporary physicians who said, “They're crazy. I might accept that sick people who are carrying a bacterium might make somebody else sick, but a well person, never.” So, Mary was in good company.

I interviewed a woman who knew Mary on North Brother Island, and she was convinced that Mary Mallon never believed—never to the day of her death—that she was responsible for those deaths. It complicates the story because we have to understand how people comprehend things in order to know how to handle them, and, in Mary's case, the Health Department didn't try to understand that part of her.

Question #4: One of the factors regarding how Mary was treated was the fact that she was an immigrant—among other things, including maybe gender—but a lot of the typhoid carriers you talked about were also immigrants and yet were allowed to go about their normal life. Could you talk about that?

Response: That's a good point. It's not just immigrants, obviously. There were class issues, too, at least in a couple of the cases. Some of the carriers could be seen as middle class, and that made the Health Department respond a little differently to them. But Mary's story puts the gender issue pretty front and center. It turns out that more women than men become healthy carriers after having typhoid fever. I don't think anybody understands why. But it may be that the Health Department officials felt they had to be harsher with women to keep them away from food.

However, I don't think that's what they did. They made Mary out to be an unnatural woman, which is why they were able to persecute her, as she put it. I think also it was relevant that she was a single woman who lived with a man when she wasn't living in her employers' houses. Thus, she was seen as someone who wasn't living the life that she should live, someone who was already immoral. Also, she had her back up more than anybody else that I was able to find, and I think the officials didn't like being challenged, so they acted more harshly towards her. The other thing, of course, is that she was the very first carrier to

be identified, and you could argue that the Health Department was making an example of her and felt that they had to do that.

Question #5: Is the fact that Mary always had her back up what really inspired most of the Health Department's actions, or was it because she was the first case? Do you think it was primarily because of her attitude?

Response: Definitely. If somebody repeatedly defies you, you retaliate, and I think that was part of it. Of course, they blamed her actions on her Irish temper more than anything else, which is where the immigrant stereotyping played a part. And that was, certainly, a factor. The Health Department people themselves were not deliberately malicious. Yet, when the long-term health commissioner of Providence, Rhode Island, wrote to the New York Health officials and said, "You shouldn't be keeping her anymore," they either ignored him or agreed, but did nothing. The officials were challenged by a variety of different people and organizations, not just by Mary. If you act in a particular way—such as keeping Mary in isolation—the longer you keep doing it, the harder it is to stop. That was also a significant factor.

Question #6: Why did Mary return to cooking after her release, even though she had been told not to?

Response: I don't think she ever thought about it that consciously. I think she tried to make a living—what she thought was a decent living—in various other ways and just couldn't make it. That was one frustration. I also think she didn't understand that she was dangerous. She really did believe that somehow they had found her and made an example out of her unjustifiably—I believe that was very important to Mary. After all, she was healthy...she just couldn't accept that she had caused any of the outbreaks.

Another thing I should say is in regard to typhoid fever. Although the number of cases had come down by the early twentieth century as water supplies were increasingly filtered, it was still a very prevalent disease. There were about 5,000 cases in New York City every year. The one case, three cases, five cases that Mary may have caused were like a drop in the ocean. So, Mary probably wondered something like, "Why don't you go after those people who were sick? Don't go after me. I couldn't have caused it. I'm healthy. There are a lot of people around who have typhoid fever who could have caused it." I think she really didn't believe it.

Question #7: Did any of the known carriers continue in risky endeavors?

Response: They did, and they were arrested again and released again. Now, once the authorities began registering healthy carriers, they soon had hundreds and hundreds of them in a city like New York, probably thousands. They were following all of them and 99% were cooperative—they didn't go back to cooking, or at least they never again came under the Health Department's purview. But there were some who came back time and again, who were recidivist in that sense, yet they were treated better than Mary.

Question #8: What happened to Soper afterwards?

Response: He continued in an engineering career. He had a very good engineering career, but he no longer did specifically health-related work like finding typhoid carriers. He was involved in health-related work like developing sewers, for example. He was very interested in sewers. But he never forgot Mary Mallon, and periodically he would write or call the Health Department to ask what was happening with her. He was just curious. They usually didn't answer him, which is interesting.

Question #9: How do we handle cases similar to Typhoid Mary's today?

Response: In the modern era tuberculosis would be a good analogy, as would SARS. I'm sure we can think of others. In all cases, the assumption is that the person you identify as "dangerous" understands that they are dangerous, right? That's a difficult assumption. Maybe it's that assumption that we should pay attention to: How do people understand the situation in which they find themselves?

I've spent many hours trying to figure out if Mary believed she was a carrier, and I spent a lot of time with a woman who worked with her on North Brother Island day in and day out for five years. I asked her what she thought because, after all Mary had been through, it was hard for me to think that she still refused to believe that healthy carriers were a possibility. That's something we can't really answer, but Mary's colleague was convinced that Mary believed in her own innocence. Mary would, for example, occasionally bring her an apple. It is hard to imagine that Mary would do that if she understood she could be risking her colleague's life.

Question #10: I wonder if education could have been the answer to helping Mary believe that she was a healthy carrier and what that meant.

Response: If we could only teach people what they need to know, then the world would be a good place. It's very interesting to think of it in those terms. Thank you.

Question #11: What happened to Jennie Barmore, the woman in Chicago who ran a boarding house until she was labeled a healthy carrier?

Response: Her children were grown and out of the house at the time. She had a husband who was disabled and couldn't work, which is why they ran the boarding house and why it was their only source of income. The Chicago Health Department didn't have a North Brother Island type of facility to put her in, or I believe they might have done so. Instead, they chose home isolation. They repeatedly put a sign in front of her house that read, "Typhoid fever. Danger" or something like "Do not eat any food. Do not leave milk." (I've never understood why somebody couldn't leave milk.) Anyway, the signs listed various things that you shouldn't do, and Jennie Barmore kept tearing them down. She resisted her treatment, for sure. Yet, they did nothing other than put her under house arrest.

Question #12: Did you look at other states to see how they treated healthy carriers?

Response: I looked at many other states and their regulations for the handling of carriers. I found no other example like Mary Mallon.

Any regulations were written after Mary Mallon, and were based on her case. New York came first and then states around followed suit. Before Mary the rules referred to people who were sick. Unfortunately for her, the New York authorities had no problem attaching those rules to Mary.

Class Exercises

Who is Typhoid Mary? Does her Role Change over Time?

Judith Leavitt told the story of Typhoid Mary not only as a window into history, but also as a way of studying public health issues that we still confront today. Has Mary's story—or more precisely, her label and legend—been used to help the public understand similar issues? To find out:

- Do a search in a newspaper or magazine database for articles that liken sufferers of diseases or potential victims to Typhoid Mary.
- Read the articles and create a list to determine how often and when the phrase “Typhoid Mary” is used as a metaphor for a danger to public health or an imprisoned individual. Is it ever used as a symbol for another issue?
- Decide whether Mary's story is used correctly or whether it has been reinterpreted over time.
- From your answers, assess whether our society remembers Typhoid Mary's story accurately or whether it has reinterpreted it.
- Is it problematic if Mary's story is used inaccurately or in a new way—why? Is it helpful to use her story, correctly, incorrectly, or in a new way—how? What do your answers tell you about the need to know the historical context as well as the current context of medical issues?

Variation 1: One variation on this activity is to ask different groups to find and analyze stories from different newspapers or time periods and then to compare the results. Is Mary's story more relevant to one area of the country than another? Is her story more relevant to one decade than another? How can you interpret the patterns that you find?

Variation 2: Another variation is to ask students to interview people outside of the class about the phrase “Typhoid Mary” and find out what they associate with that term. Then follow steps 3-5 above.

Public Health Protection in the Law versus Personal Freedom

Did Mary commit murder?

- Divide the class into groups to debate: “Should Mary have been convicted of manslaughter in 1915, after she returned to work as a cook in a maternity hospital

despite promising not to take a job as a cook? Why or why not?” Note that 25 people became ill because of her cooking, and two died.²³ Remember that, while murder in the first degree usually requires deliberate intent to kill and a plan to commit homicide, there are other kinds of murder charges. A defendant is guilty of a lesser murder charge—involuntary manslaughter—when he or she commits homicide “because of criminally negligent or reckless conduct.”²⁴

- After the debate, assess the following question in a class discussion or an essay: What do your answers reveal about expectations to do with personal responsibility, individual liberty, and public health?
- Then, students should compare their responses. Why do they differ, or why are they similar? Did arguments rest on science, political ideals, justice, personal experience, and/or other grounds? What do people consider when making judgments? Are the grounds or reasons different from the ones used when Mary’s contemporaries judged her? Why or why not?

ABOUT THE AUTHOR

Judith Walzer Leavitt is the Ruppel Bascom and Ruth Bleier Professor Emerita at the University of Wisconsin at Madison. She is a prolific scholar whose interest in the history of medicine has led to research on public health and gender on topics ranging from municipal health issues to contagious diseases, to childbirth. Perhaps her most famous work is *Typhoid Mary: Captive to the Public's Health*. That book inspires the story she recounts, as well as the issues she raises below.

Chapter 82

PREPAREDNESS IN PUBLIC HEALTH: A NEVER ENDING NEED

José Montero^{*}, MD, MHCDS

New Hampshire State Health, Concord, New Hampshire, USA

ABSTRACT

Due to the ease with which people and goods are able to move within and between countries via efficient transportation means, the probability of the general population being exposed to a novel pathogen exists. Dr. Montero's lecture emphasizes the importance of public health and healthcare systems being prepared to handle the unknown and the inevitable. This chapter highlights the key aspects of the public health science—known as epidemiology—that are required to prepare for, control, and ultimately prevent disease outbreaks. Dr. Montero utilizes several renowned pandemics, including Severe Acute Respiratory Syndrome (SARS), Influenza, and the Middle Eastern Respiratory Syndrome (MERS), to illustrate the tools he and his staff use on a daily basis, as well as the necessary systems that are required to detect an outbreak of disease, educate the public, and limit its spread. This chapter presents a comprehensive overview of how important it is that our public health and healthcare systems work efficiently and in an integrative manner to keep populations across the globe healthy.

LECTURE

Public health emergencies are always happening, so we need to be prepared. How we prepare, and what we prepare for, is the focus of this lecture. To present the historical context of public health preparedness, I am going to start with Severe Acute Respiratory Virus, SARS.

^{*} Corresponding Author: *New Hampshire Medical Society*, <https://www.nhms.org/content/jose-montero-md-mph-ms>, accessed March 3, 2017.

In February of 2004, the World Health Organization (WHO) detected some unusual epidemiological activity going on in China. Unusual health events in China are not unexpected—there are a billion people in China and there’s always something going on. This time, 300 people had atypical pneumonia, or infections in the lungs, in one particular area of the country. When the WHO started to investigate, they found that this unusual health event had been occurring since November 2003. Now, in February 2004, as WHO began to investigate these cases, they noted that there were also cases in Vietnam. The WHO sent a great team to investigate those cases. Unfortunately, later on, the team leader got infected and died. At that point, the WHO issued a travel advisory, which means, “Don’t go to this place, and don’t go to this other place. If you are traveling, you need to make sure that you are not sick. If you have a cold, a fever, respiratory symptoms, we won’t let you on an airplane because you may be transporting a particular infection, and we still don’t know what this is.”

In the middle of March 2004, the WHO developed an international network of laboratories. To do this, they go to places around the world with great technical experts and say, “Guys, here are some samples. Help us. We need to learn what’s cooking? What is this disease that is killing people?”

Then, on around March 20, 2004, the health officials in Hong Kong said, “We think we know how this is happening.” There was a doctor, a lung specialist, who’d come from the Guangdong province and gone to Hong Kong. He’d stayed at a hotel called the Metropole. When he’d arrived, he’d been kind of sick so the officials started looking into it. They found out exactly when the doctor had been at the hotel and who had been in the rooms near his. They tracked down those people to see who’d been where and when. They found out that the doctor had come from Guangdong to the Metropole and had infected somebody from Hong Kong; and then somebody else who went to Vietnam got infected, and then somebody else who went to Singapore got infected, and then somebody else who came to the US got infected, and then somebody else went to Ireland and he was infected, and then somebody else went to Canada . . . and so the nightmare, SARS, occurred.

What else happened? Well, the Chinese asked the US government, “Help us. We really can’t manage this.” For the Chinese to say that, it had to be really dramatic, really dramatic, because there’s a lot of international politics at play. By March 27, 2004, Chinese health officials were telling the Chinese public that they could not go to Canada in an airplane, no one could go to Singapore, and no one could or should go to Hong Kong. Imagine the economic and social impact of those recommendations and decisions.

Steps were then taken to manage the disease at a more local level. The Chinese started to see a lot of cases in one particular high-rise building in the Guangdong province and decided to restrict people’s movement—something that’s kind of hard to do in the US. People had to stay put in the building—there were around 300 people actually sick in that one building. Other residents were told to wear masks. In China, people have no problem with this. You tell them, “Use a mask because that will help you to prevent transmission of the disease to others,” and they do. Can you imagine that happening in the US? You’d never get the same level of compliance. In Guangdong, though, they started doing the right thing and used masks. Furthermore, people who were allowed to travel were screened for respiratory signs and symptoms. They still had to use masks if anything seemed abnormal and several used masks just because they thought it would help prevent them from acquiring the infection themselves.

Finally, in April 2004, we started to see the disease come under control, but by then camps had been set up for people who were infected. How? In China, you tell a couple of thousand people that they cannot leave a building, and then you tell them you need to move them to a place where they cannot infect anybody. All these steps require a mix of quarantine and isolation and social skills that simply don't exist in the West.

In Toronto, Canada, one patient of Chinese descent came from Hong Kong and infected his family. He was admitted into the hospital where he infected the hospital employees, who, in turn, infected a lot of other people. By the end, there were 400 cases in Toronto and 44 people died. Travel, conferences and business coming to the city were dramatically decreased. A billion dollars were lost to the city's economy because of SARS.

Thus was the chain of events: A guy went to a hotel, somebody was in the next room, got infected, went to Toronto, and more than 40 people died. This was the twenty-first century; it was not the Middle Ages. This was your highly developed, technological world.

This kind of event reminds us that the world is really a small place. You are incubating a disease, and you can go wherever. From this one SARS event, we had about 8,000 cases and 774 people died. But the world came together to tackle the problem, to manage it and to prevent further spread.

Now, let's bring this to a more local picture: New Hampshire, the third healthiest state in the country, a state where we have really great health indicators. But the reality is that it doesn't matter how good our indicators are when we have an infectious situation like the one just described. I'm going to look at several different situations to show you what we have done, what we can do, and what we should do in the face of health crises.

One big problem is how to communicate about such an event. It's always scary when I go on TV and say, "Well, we have this thing going on and we need to close this place, or we need to do X, or we need to do B," but the reality is that the media has a day-to-day duty to report on such topics, so I do need to go on TV to present information. I don't know how many of you still watch TV, maybe you only read Yahoo or Google news. But, either way, you'll have seen stories that say something like, "Authorities identified this patient with whatever flesh-eating bacteria. It was in whatever place, and we're all going to die by 11 o'clock tonight." Wait a minute... you're a parent and you've just been told that your kids are going to die by tonight at 11. Everything is a big emergency. This news becomes the regular news, the regular coverage, and we move into emergency mood and mode!

But is that reaction appropriate? How do we manage the right level of awareness? What is news and what is important are not necessarily the same things. We need to be careful about how we announce a situation, how we educate, and how we bring information to the public. Once informed, people can choose their risk level based upon their own reasons. For example, they can choose to get vaccinated or not.

We also need to consider what causes an epidemic. First, we're talking about infectious stuff. What can happen? Viruses change. They mutate. They are engineered to survive and they are incredibly good at that. But, if somebody brings a SARS-type virus into our society, we are all susceptible to that. In addition, we could have an enhanced mode of transmission—enter bioterrorism. And that is now part of what we do: we prepare and plan for the management of a bioterrorism event, whatever it is—ricin, anthrax, or smallpox, for example.

Then there is the consideration of the differences in susceptibility of the disease hosts. There are people who are immunosuppressed for particular reasons: a cohort of cancer patients, a group of the elderly, a bunch of diabetics—all of them have immunity issues. If

they are exposed to something then, as a group, they have the possibility of developing something. What do we do? Well, we have 10 steps that we follow every time we have such a situation so that we can investigate and determine what's going on and what to do.

The process is to verify, index, and scan. We collect samples. You get sick, so we come and take blood, saliva, feces, urine, your liver, your brain (not really, just kidding) ...whatever we need we take from you because we need to figure out what's going on. You may not like it—especially if it's your brain—but you know, all for the public good! We talk to the providers who saw you. In my job, I don't see patients: I just get the reports of the cases so we can try to figure out what's going on out there. Then we start to create lists. Who else has something like this? Who else has reported something like this? We start looking at ways in which we can determine the extent of the problem. Is this the first case, or has it already been happening, or has it already expanded somewhere else? It's detective work. That's what we do.

We look all over, at schools, absentee lists, death certificates, outpatients, and national databases. Then we question: Is this really abnormal? We look at epidemic curves and see whether this is truly a situation. Is this situation on the baseline, or above it? For example, in situations like some gastrointestinal outbreaks, we find that there are peaks and valleys. If it's January, I know that people are going to suffer outbreaks of diarrhea. It's called the winter vomit, or Norovirus, and it happens every winter. If you're reading this in December, then in a few weeks you are going to get sick because you didn't wash your hands and you eat bad food. It's expected. That doesn't mean that it's not a problem. Nor does it mean it's not something we need to act upon. But if I start to see a peak at a different time, *that* may be something unusual. For example, we've had abnormal peaks that accompany the emergence of a new strain of Norovirus. When that happens, we need to decide what to do. Do we have the resources to tackle the situation? Is it important? Or do we decide that, yes, although we have a few cases of this illness, it's so mild that it's not worth investing any resources to control it because no one is going to get severely ill or die.

Next, we try to define the epidemiology of the information that starts to come up. For example, in New Hampshire from 2004 to 2006, we placed all of the information we had for West Nile Virus or Eastern Equine Encephalitis on a map. We looked to see if there was a particular geographical pattern, a particular ecological pattern, or indeed, any particular factor that could help us determine how the disease was moving. And, again, we did our epidemic curves. (Epidemiologists are funny people. They need their numbers and their graphics and all that geeky stuff—I'm a recovering epidemiologist... I don't do that much anymore!).

Now, we are able to start to construct the hypothesis about how the virus works. To do this, we need to go back to our lessons in biology and in ecology. We know that things like West Nile Virus or Eastern Equine Encephalitis come through mosquitoes, but mosquitoes bite birds most of the time, and then in some cases they bite humans, so we need to figure out what the reservoir is.¹ Where do the reservoirs stay? How do they transmit the disease? Once we know that, we can generate hypotheses about how we're going to control the disease, who will do the controlling, and what extra samples we need. Then we implement the measures that we need to utilize. We can quarantine people. We can isolate people. We can recommend immunizations. We can recommend antibiotics. We can recommend that everybody stay

¹ A disease reservoir is the species that hosts the disease; the host may not become seriously sick or sick at all from the disease.

home. Recommendations depend upon what we need in order to manage a particular condition under particular sets of circumstances. For example, one disease may require one type of management when the weather is cold and another when the weather is warm. This kind of decision-making requires a lot of science and a touch of art.

(One important thing to remember here is the difference between isolation and quarantine. You isolate people who are infected: if you are coughing, and I have a diagnosis for you, I can isolate you. Then I will quarantine those people who have been in close contact with you. They are not sick, but they were close to you and so need to be quarantined so they don't spread the disease as they develop symptoms).

Now comes the issue of reporting. If deemed necessary, I have to go to the public and say, "Hey guys, this is happening." Sometimes we don't report it. However, by law, health care providers must report to us, the public health officials. Because we have their reporting we can keep track of things and see how they evolve in the future—that is our long-term surveillance, without it, we cannot hope to control health crises. Finally, if we are successful and the danger passes, we hug and kiss and sing "Kumbaya." We deserve that hug. Sometimes it's the only thing we have.

Those are the principles. Now, how do we play this in New Hampshire? I'm going to pepper the New Hampshire examples with some national data and references to some particular examples in history.

We manage health situations in four ways. First, we create an infrastructure that allows us to keep track of things. Then we develop a system that allows us to analyze the information that we collect in order to keep track and forecast. This is not a guessing game. Next, we implement our protocols to control a health situation. Finally, we conduct the long-term surveillance, as we move into recovery.

First things first: We keep track of you. How? You went to the clinic and you had a funny disease that I have a particular interest in, so your provider reports you to the Department of Health. (The Department of Health has a list of reportable conditions. Should doctors diagnose a case that is on the list, they are supposed to call us to notify the Department of Health. Reportable conditions include sexually transmitted infections such as gonorrhea or syphilis, vaccine-preventable conditions such as whooping cough, diphtheria, or polio, and a handful of really severe, weird diseases.) We also look at death certificates and have a link to veterinarians who tell us about particular diseases. In a sense, it's all a bit Big Brother-ish.

Our work is facilitated by automated systems. We look into emergency rooms in a live fashion. I have a system of computers with all of the de-identified information of every diagnosis that comes to us. But I don't get names; we don't create big databases of whom you are or what you do. What I do get is information so that I can see if there is a big increase in, for example, respiratory illness or cases of meningitis or particular skin rashes that may tell us that a bioterrorism event has occurred. All of that information comes into our office and we create tables that allow us to study trends and so see if something abnormal is happening.

If we do spot an abnormality, then we reach out to the clinicians. We say, "Hey, be alert. You have something cooking in your region. Pay attention," and they do. In some cases, we ask for specific samples and those go to our public health laboratory, where we do a lot of testing. In 2012, for instance, there was a rise in the number of cases of Hepatitis C in southeastern New Hampshire. In order to investigate the matter, we basically did DNA fingerprinting. The New Hampshire Public Health Laboratories is one of the few laboratories that can do this. We can identify all of the patients whose Hepatitis C strains match, which in

turn allows us to identify the original source of the infection. By doing that, we can either prevent future outbreaks or prevent a current outbreak from spreading. In the 2012 case, many people became infected before we knew it was happening, but after the source was identified nobody else was infected. That's the purpose of what we do.

How do we forecast things based on the information at hand? Well, we need to keep track of data. Take the West Nile Virus. In 1999, it was present only in the New York metropolitan area. It spread in 2002, 2003, 2005, 2006, 2013 . . . and by May 2014, it was all over the place. That's an epidemic. It spread that quickly.

Studying and tracking the data allows us to forecast when and where things will come. We see that there is something new...West Nile Virus. The last time we checked the Nile River was not in the US, but here it is a virus that was identified there. Thus, somebody must have imported it. The first issue is that we have no idea how the virus will evolve in our climate and ecology. We need to keep track of it so we can begin to forecast how it will create cycles and what the vectors are going to be. We have identified several mosquitoes that are involved in the transmission. One is the *Aedes japonicus*. In other words, we have an African virus that can use a Japanese mosquito to transmit infections in the USA. How does *that* work? We don't know how it began, but once identified we can and do keep track of it.

But that's not the only type of thing that we need to keep track of in the infectious diseases world. Let's talk about Bambi. Bambi, and other deer like him, carries ticks that are approximately 1 mm in length, hard to find, and can give you Lyme disease. Twenty years ago, we had 60 cases per year in New Hampshire. In 2012, there were 1,300 cases. Fifteen to twenty years ago, Lyme was only found in the southeastern part of the state. Now it's all over, although most cases are still found in southeastern New Hampshire. By tracking the data, public health officials could see that the disease was moving north. Thus, we could forecast that it was going to reach a particular region before it did. This allowed us to focus our education and prevention messages in that region. We worked with local clinicians so they knew how to diagnose the condition. Prior to our training, they were unfamiliar with the disease and so a case could have been missed, resulting in chronic issues for the patient.

Now let's look at a different example in another part of the world. Around 1 billion people are mandated to go to Mecca at least once in their lifetime, if possible.² As you may imagine, with such a mass of people arriving in one place from all over the world, space becomes extremely tight and you create the ideal situation in which to exchange viruses or bacteria. After this pilgrimage, the *hajj*, outbreaks of meningitis have been often reported around the world. OK, but why should we care about that here in the US? Because there are other global events that can trigger similar outbreaks—the World Cup or the Winter Olympics for example. By tracking and understanding the *hajj* and the locations many of the attendees came from and go back to, we can predict what will happen at other large-scale gatherings. If we pay attention, we can foresee potential health threats.

There are things that are emergencies and there are things that are kind of day-to-day. Is the *hajj* an emergency? No, it's a huge task for surveillance, but it's not an emergency because we know that it's happening. There's a big difference between the focus of day-to-day surveillance work and a public health emergency. Public health preparedness requires a lot of work all the time.

² The pilgrimage to Mecca, or *hajj*, is one of the five pillars of Islam.

The world today has become really small. People can get on airplanes and go places and a disease can spread quite quickly. Consider air flights over a 24-hour period. In that short time, you can connect North America to Europe to Africa to Australia. If you study the patterns, you can understand how a Japanese mosquito can infect people in New York City with an African virus. In the same way, meningitis travels around the world when people depart from Mecca to return to their homelands, and this doesn't even touch on shipping containers and the maritime transfer of goods. Transportation of cargo allows huge numbers of mosquitoes to migrate around the world. When you bring tires from China, for example, mosquitoes hitch a ride and breed for weeks in the water in the ship's hold.

Nevertheless, air travel is the most significant issue when it comes to prevention. We need to manage the prevention of infection in planes, but we also need quarantine stations in ports of entry to this country. The main international ports have quarantine stations staffed by employees of the Centers for Disease Control and Prevention (CDC). This means that if we are tracking a rise in a particular disease and then we detect symptoms of that disease in a passenger entering the US, we can stop the person, bring them to the station, test them, and thereby determine whether or not they should be allowed to enter the country.

For any investigation, there are protocols and resources. Principles have been developed that allow us to identify and predict. The problem is determining for what we are planning. Are we planning for flu? Tornadoes? The H7-M9 virus? An ice storm? Hurricanes? The short answer is: yes. We need to plan for all types of emergencies. But what we don't want to do is create so many systems that it gets too complicated. Thus, at the end of the day, it is essentially the same people who respond to all emergencies. It's Public Health—whether it's an infection, a dirty bomb, or a hurricane... My team responds to them all.

We follow national standards called the National Incident Management System, and we create a structure called the Incident Command Structure. This set up was developed by firemen who, when managing big wild fires, need 5,000 people working in several places. To coordinate and control their efforts, there's an Incident Commander and four sections: operations, planning, logistics, and finance. We keep track because when we need funds, I have to go to the governor and say, "Hey, I need money." Then I have to go back and say "Guess what? I need more money." That's something that nobody ever likes to hear.

As you might imagine, national standards are complex and multi-faceted and involve a lot of paperwork. In New Hampshire, we follow them as much as we can. We choose a few things to prioritize and we work with the healthcare system. In the past, we worked almost entirely with hospitals. Now, we realize that we need to include the whole healthcare infrastructure. In the event of an approaching hurricane, you can get people out of a hospital, but what do you do with the 300 people in a nursing home? Where do you move them? How fast can you move them? There's a dementia unit with Alzheimer's patients. Where do you move them, and who will take care of them when you are moving them? Seven percent of our society has diabetes and half of them are using insulin. How do you handle that? There's a bunch of people with COPD who require portable ventilators. If we need to move them out of their houses, they will need access to power for their ventilators so that they can stay alive. They can't get it from a hospital.

In the event of an emergency, we track different things, and plan for things that previously we were not looking for. That's why we engage in all kinds of theoretical discussion about how we plan for disasters and what we learn from each of our emergency responses. In New Hampshire, we have the Department of Health at the state level but only

Manchester and Nashua have full service local health departments, so we had to create a system of regions that will work with us to respond at the local and regional level. Within each of those regions, we created a system so they will know how to respond, whom to ask for help, and who makes the final decision so no one is confused.

We decide where and what to prioritize. We know that we need to work more on community preparedness or on medical surge capacity. For example, what happens if I have flu pandemic and I need to increase the number of available hospital beds by 20%? It doesn't just happen because I say so, and even if it did, who would take care of the patients? Where will the healthcare workers come from?

For illustration, the best example is flu pandemics. Flu can be quite deadly and the possibility of fatalities is quite high.³ The most famous flu pandemic, known as the Spanish flu, occurred in 1918. But it was by no means the first—Hippocrates described one way back in 400 BCE! Flu pandemics are like moving targets, you never know for sure which flu virus is going to get you. Four years ago, we were planning for a flu pandemic coming from China and instead we got one from Mexico.

There are many ways to try to stop the flu. We have a flu epidemic every year. And yet, even with all the years of surveillance, we still have been unable to crack the flu nut. Around 20,000 to 30,000 people still may die from flu-related conditions every year in the US. Our problem is that flu viruses change all the time. They are RNA viruses with no self-control. When DNA and RNA are replicated, you have a form of quality control that allows you to see if the replication process didn't work and therefore cannot be used. That doesn't apply here: The flu RNA changes all the time; there is no quality control; and it just keeps mutating.

Flu viruses may have antigenic drifts or antigenic shifts. Shifts are major changes and can cause pandemics. There is a huge interaction between flu viruses and animals. There's the well-known chicken flu and swine flu, but other animals, such as dolphins, are susceptible, too. And viruses can jump from species to species, which puts us at risk.

What kind of risk? Well, the Los Alamos laboratory in New Mexico is famous for nuclear stuff, but they also do incredible advanced math work and modeling. They can tell us how quickly infections can spread in today's world. Thanks to a model they developed, we know that in just three months, the whole of the US could be fully infected with a flu virus. That's the kind of thing we need to plan for.

There are many variants of viruses and several different strains that we track around the world. In 2012, a flu strain came from pigs in Mexico. Kids apparently went to a fair, interacted with the pigs and then played and touched and kissed one another just as kids do all over the world. Next thing you know, the flu is spreading. Then there's the bird flu that came from China. In some areas in China, people and animals live and work in close proximity with one another. A person will be exposed to viruses coming from their animals, be they chickens or dogs, and those viruses will spread from species to species and be re-assorted.

Getting a system in place that allows for worldwide control of diseases is complex because countries and cultures are different the world over. It's tough because we are one society asking another, often underdeveloped, society to act in a certain way. With bird flu, for example, we asked people with no industry and no way to earn a living other than by raising chickens to kill all their birds in an effort to fight the virus. And they did. The WHO has tried to create a worldwide system by which we agree on the best practice for raising

³ See Chapter 1 in this book for a more detailed discussion of flu pandemics.

birds and how to do things, in order to avoid another outbreak and spread of bird flu, but until we have a more developed and equitable world, we will have no way of controlling all social conditions.

So how can we create this fair and equitable world? It's not going to happen with just the WHO, it will need Harry Potter's "Ministry of Magic" and all its partners. We need a concerted effort worldwide. We need to provide assistance to poorer communities so they can do better surveillance, so we can find things early, and intervene early. If we can do that then, hopefully, we will be able to prevent future epidemics from happening.

Let's return to New Hampshire and the flu pandemic of 2012. We did four things: We carried out surveillance; we provided medical research, dissemination, and met other clinical system needs; we did prevention; and we implemented actions to contain things at the community level.

Let's start with the surveillance. People keep asking me, "How is the flu season going to be this year?" I have no answer, I don't know. We cannot predict how the viruses will evolve and how they will move each year because of the re-assortment and the antigenic drifts. Nevertheless, we do keep track. We look at emergency rooms. We ask doctors to tell us how many of their patients have flu symptoms. We find out which school districts have above-normal absenteeism. We map all of this and track it so that, if a pandemic does happen, I can flatten the curve. Let me explain: If I don't have a vaccine—and I will explain why I may not have a vaccine—I need to prevent all of the cases from happening at once. It's one thing if I need to provide care to 50,000 people over three months, but quite another if I have to provide care to 50,000 people in three weeks—I simply don't have that kind of capacity. Truth be told, I probably don't have the capacity for the first scenario, either, but it would certainly be easier and fewer people would die from lack of service.

Let's talk about space. Here you all are, together in a classroom. I need to spread you out. But how? I send you home because the space that you have at school versus the space that you have at home is quite different. We use social distancing. We cancel mass gatherings. We use non-pharmaceutical interventions. If you are somewhat ill but don't know what you have, we ask you to stay home. We do that on a regular basis—every day with pertussis (whooping cough) or tuberculosis patients.

When people don't want to stay home and we really feel that there is a high risk, we use police powers—these give public health authorities the right to write and sign an order restricting a person's movements, even put a person in jail if need be. Such measures would not be my choice; we always try to get people to stay home or move them to a hospital. Nevertheless, in the last 10 years we have needed to go to these extreme measures a couple of times. The next step is then to use formal isolation and quarantine.

How and when we implement all of these measures depends on how severe the disease is and where we expect it to be. We need to plan for the impact of a disease, and we want businesses to plan, too. What will happen if, for example, 10% of your people are sick? Can 20% of your people work from home? Can your business telecommute more? If all our worksites add in telecommuting, do we have the infrastructure to support that? Actually, no, we don't. If, for example, we put all of the University of New Hampshire on the Internet, it wouldn't work. We also have to consider how long we'll need to use any of these measures. It depends on both the disease and the severity of the particular pandemic. It may be three days, seven days, or two weeks.

We need to plan in order to minimize the impact. If we're sending people home and they cannot work, who will bring them food? If we isolate and quarantine people and we don't want them to leave the house, how will they eat? Who will bring food if they may be exposed to the disease? We've been planning for this type of thing and trying to provide proper training for many, many years. At the end of the day, most things actually come back to the basics: Wash your hands and use some protection against respiratory infections. It's not the complete answer, but it does help, dramatically. Do we have the capacity to care for large numbers of people being isolated in a hospital? Normally, for the severe diseases that we've encountered, the answer is no, so New Hampshire has invested in a bunch of respirators that have been placed across the state ready for use in an emergency.

Then we have to think about vaccines. If we're talking about flu, do we have flu vaccines? It's the same every year: We worry that we won't have enough flu vaccine. The production system of flu vaccine is quite archaic. We're still making it in eggs! Each year, in December, we look at what's going on in the other hemisphere. From those observations, we forecast what type of viruses is going to come here next year. Then, in January, we place an order with pharmaceutical companies around the world to produce the vaccine that the northern hemisphere is going to need. That goes into production to be ready by August, to be distributed in September, to start vaccinating in October. It's a nine-month process. But if we have an unexpected pandemic, we don't have nine months.

There has been a good deal of investment to provide different vaccines; different techniques have been developed in an effort to identify better antigens, better components in the capsule of the virus, to provide a long-term vaccine that won't be so impacted by the shifts in the virus. But, we're not there yet. During the 2009 pandemic, we had half a million doses of vaccine, which we got out to the general population as soon as we could. Within the first four weeks, we didn't have enough vaccine to treat everyone. And yet, at the end of the pandemic, I was left holding 150,000 doses of unused vaccine — by the time we'd actually got it through production, it was too late, the pandemic was over.

We do have other weapons in our arsenal. We can use antivirals—medications that, in theory, kill the virus. So far, most flu viruses are susceptible to the antiviral, Tamiflu. We have supplies to treat thousands of people. We keep them in a secure location because if we do need to use them, we need to pick and choose how we distribute them.

Basically, when it comes to flu, we do everything we can to buy time in the hope that we can get a vaccine.

If we have a vaccine, the key question is ethical: Whom do I vaccinate first? Me. If I'm not here, I can't run the show, right? Right. So, who's second? You? OK. Why should I vaccinate you second? Beyond the fact that you are awesome, do you meet any other criteria that might demand that I vaccinate you second? We may choose to vaccinate younger people because there is a higher chance of them infecting others. After all, if I want to stop the transmission, I need to stop the transmitters. I'm not calling the young bad, infectious vectors, but they may be.

We may do that but we also have to consider social value. Do we vaccinate the oldest or the youngest? Do I vaccinate the 65-year-old, like my father, or the 5-year-old, like my daughter? How do we, as a society, come to those decisions, and who makes the call? Who would you think should make that call? Who wants my job?

I'm not alone in all this. I am helped in my decision making by an ethics committee. We have criteria and we know that our decisions will be different in every pandemic. There are

pandemics that will kill more of the young. There are pandemics that will kill more of the old. We need to balance and there is no pre-determined right and wrong.

There are some funky things to be considered, too. For instance, what happens if people start dying? What do I do with all those bodies? If we had the million fatalities that occurred during the pandemic of 1918, we wouldn't have the capacity to process the bodies—I need to figure out where to put them. Then there are the volunteers. Great! Except, please don't help me. Please, don't. If you don't have a clue what you are trying to do you will actually cause me trouble. With the best intentions you leave your work and family to help with the disease, but then, because you don't know what you're doing, you will become sick and I'll have to use other people to help you, to keep you alive.

Volunteers are good news when they've had the training, when they are part of the system, and part of a team. Imagine I need nurses and doctors to take care of you and your mother. Somebody shows up and says to me, "Hi, I'm a doctor. Do you need one?" I can't just say, "Sure, great, go and treat them." I can't do that! My lawyers won't let me because I have no idea who that person is. Thus, we have a system through which we register volunteers ahead of time, and we manage it as well as we can.

What happens if you don't speak English? What happens if you are homebound in a wheelchair? How do we get the vaccines to you? How do we get food to you? How do we get you out of your house if we need to evacuate you? We need to look at all these things, and we need to look at the socioeconomic impact of all our decisions—when we close a school; when we close a public space; when we quarantine somebody; when we don't allow a person to go out for a week, for two weeks, a month, three months, as can sometimes be the case for tuberculosis.

We need to be creative. We know that every time we implement a plan, we'll see that, "Oh, look, this doesn't work as we thought." We learn, and we improve. Hopefully, we'll be ready when the big one comes.

For example, there is a new SARS-type situation happening right now (2013). It's called the Middle Eastern Respiratory Syndrome (MERS). We have cases coming from Saudi Arabia and other countries. It's a new type of Coronavirus that is from the same family of SARS viruses that we had years ago. So far, we have identified the disease in people, bats, and camels. It's not as transmissible as some infections that we have had in the past, but it has the potential to be and is quite severe in those who develop the disease. What we don't know is why some people develop the disease while others do not. Most of the people we've identified have contacts who are healthy. Nevertheless, we're paying close attention because it has the potential to become the next pandemic, the next SARS. What happens if this actually grows a little more in Saudi Arabia and many affected Saudi nationals travel around the world? It won't just be the Metropole hotel, it'll be the Metropole multiplied 100,000 times.⁴

What's going to be the next pandemic? I have no idea. We have systems that allow us to project and try to predict, but we have no way of really knowing. All we can do is keep track of things, and keep the information public so that people know what we are working on. Only

⁴ Stephanie R. Bialek, MD, *et al.*, "First Confirmed Cases of Middle East Respiratory Syndrome Coronavirus (MERS-CoV) Infection in the United States, Updated Information on the Epidemiology of MERS-CoV Infection, and Guidance for the Public, Clinicians, and Public Health Authorities — May 2014," *Morbidity and Mortality Weekly Report*, Centers for Disease Control and Prevention, May 16, 2014, accessed March 3, 2017, <https://www.cdc.gov/mmwr/preview/mmwrhtml/mm6319a4.htm>.

then can we dispel the perception that we're hiding information or doing something inappropriate. We need to be out in public communicating with people. It's a tricky balance because some people will think we are just trying to create fear, while others will say we're making it too easy to prevent disease, which goes against nature. Every time we announce something, we open a whole new can of worms.

So, that's what the Centers for Disease Control and Prevention does: They lead the US Public Health system as we prepare for whatever type of emergencies might occur; we plan for them. Only by preparing and planning can we properly respond. We know that we will never be done because diseases will never stop changing. That's the nature of biology, the nature of ecology, the nature of science. We keep discovering things and the mark keeps moving.

DISCUSSION QUESTIONS FROM THE AUDIENCE

Question #1: I'm curious about surveillance and Big Brother. You said that clinicians are recording outbreaks and incidences, but are people who don't have health insurance represented? Are any groups over-represented?

Response: I am Big Brother, by definition. Who am I looking at? Everybody, as much as I can, in the sense that we get clinical information from different clinical encounters. We get information if you go to your doctor with whooping cough, and if you are uninsured and in the emergency room, I will still get the information. But, if you don't go to the healthcare system, and you don't get a diagnosis, I won't get a diagnosis until you die, and then I will see your death certificate.

Are some groups over-represented? Well, yes, those with better access to healthcare. The reality is that in most cases, the information that we are looking for is there. I try to keep track of population trends. I also try to identify individual cases, so we can prevent spreading disease around them.

If you have a disease, in general, it's not public health's responsibility to treat you. By the time you are reported to us, you have been already prescribed a treatment. My concern is to prevent the disease from spreading, to identify the people who have been near you so we can advise and protect them. "Hey, you were less than four feet away from her. You should get Cipro, or whatever antibiotic is appropriate, right now, because if you don't, you will have this disease." That's the purpose of this Big Brother; we're not here just to keep track of you.

Question #2: What is Norovirus and how is it transmitted?

Response: Norwalk virus—now called Norovirus—is a gastrointestinal infection that has a quick incubation period, around 24 hours or even less. It is easily transmitted by hygiene improprieties like not washing your hands after you go to the bathroom, which is apparently quite a frequent practice around the world, including in this country. You look at schools and the kids go to the bathroom, and then they come out and blow their nose. They say, "Hey, how are you?" and touch and kiss and hug. That's the way that it goes around. Then, there are volunteers at the cafeteria. They touch the food and give you the salad. Then you get sick, and

that afternoon you vomit. Then, when people come and clean, they spread it around even more. That's how Norovirus works.

It is essential for us to identify sick food workers. It's something to which we pay close attention: You have Norovirus; are you a food worker? If you are a food worker, I'd rather not have you working for a couple of days because, even with good hygiene, there is a chance that you're going to infect others.

You have Hepatitis A. Are you a food worker? I would rather not have you working while you are acutely infectious because you may contaminate the food. If you do, then I will have to do a clinic as we did three months ago in Hopkinton, NH. We vaccinated 1,000 people—maybe only 300 went to the affected restaurant but 700 others came for the vaccine. That's the way that these things work.

Question #3: New Hampshire is famous for being a libertarian, “Live Free or Die” state.⁵ Does that make your job harder than it might be in another state? Do you get people and politicians complaining that you're infringing too much on individual liberty more than you would in, say, New York or California?

Response: Yes. As you say, New Hampshire is a libertarian state. That's the ethos of our society, and as an organization we are quite careful and respectful of that. We have had interesting discussions with elected officials over the years. Actually, there is one official who openly calls me Big Brother, and we have a really good working relationship. He's an incredibly smart fellow, and we just have a different philosophical construct about what we should do. Most people, including the elected officials, understand our purpose.

Question #4: It strikes me that these bugs don't respect political boundaries very well, and I've always been curious why we have a state public health mechanism to respond to these things. Why don't we do it at the national level or even at the international level? Is there a particular advantage in dealing with these problems at the state level?

Response: That's federalism for you. We are a union of equals and each state has the sovereign right to do as it feels appropriates—“Don't tell me what to do, federal government.” However, we do have the Centers for Disease Control and Prevention (CDC), which is a broad national organization that does a lot of research, develops strategies, and consolidates data so that we can look at things nationally or regionally.

The list of reportable conditions is different state by state. We don't have a national, unified list. The state epidemiologists get together every year and look at the list and add things, but then every state needs to adopt the list and not every state will. As an example, New Hampshire has never adopted Hepatitis C as a reportable condition. I think we might be the only state that still hasn't done so.⁶

That said, when emergencies do happen, we work with the other states and with our regional partners. In New England, the six directors of public health speak every Monday morning at 7:30 am via phone. We go over what's cooking and what we are doing. We realize that a lot of the things we need to do are education-related. If I come and say everybody needs

⁵ The New Hampshire state motto is “Live Free or Die.”

⁶ Since Dr. Montero's talk, Hepatitis C has been added to New Hampshire's list of reportable conditions.

to stay home, and the commissioner in Massachusetts says, “I don’t care,” that is a big mess because, in addition to us, there are the talking heads who make big bucks every time they talk in and to the media. And you *know* they’ll talk about this.

So, we do work in a coordinated manner. For example, we are trying to figure out regionally what to do with Lyme disease. We’re not going to kill all the deer, so what messages can resonate across the region? We have a significant media market in Boston and then smaller media markets—Burlington, VT; Augusta, ME; Portland, ME; Manchester, NH—that don’t have the same penetration. How do we manage those media markets and unify messages between all of us? We are working on those types of things. There is hope, but there will never be a fully unified system because, as I say, we are a union of equals. We have the right to do as we please; it’s the people who elect the officials, and they are the ones who decide... I just execute.

Question #5: Do you think the Affordable Care Act will make your job easier?

Response: I don’t know if it’ll have a huge impact on emergencies. In general, we manage the treatment of infectious diseases. If you have tuberculosis but don’t have insurance, we figure out a way to get you treatment. If you have whooping cough and you don’t have the antibiotics, we figure out ways to help you.

In a big emergency, I don’t know how much the hospitals would bill for each individual thing. We had this discussion when we talked about preparing for the flu pandemic: Who will pay? In general, insurance will pay for those who are insured. From that perspective, having everybody insured will decrease the financial risk. Also, with the Affordable Care Act came the creation of the Health Information Exchanges. Health Information Exchanges give us a quicker reporting system for health diagnoses that may be of public health interest, and from that we may detect or keep track of things in different ways.

Right now, we keep track of the trends in emergency rooms and when we identify a patient of special significance, we go back to the hospital and ask that they talk to their doctors. Or, we ask the hospital to contact the patient and confirm the diagnosis so we can then get to that patient. Those are matters with which the Affordable Care Act can help us, from an emergency response perspective.

Question #6: Do the public health authorities ever consider withholding information that might be useful to individuals when deciding on appropriate action, because you’re afraid of how we will act if we have that information?

Response: No, I do not consider withholding information as a standing principle. However, what information is relevant at any particular time will vary. Let me give you three real-life examples:

There’s a 57-year-old woman with meningitis, living with her husband. Meningitis is quite infectious, has a high risk of transmission, and in general, a 10% mortality rate, give or take. We investigate and discover that this person stays home most of the time. We cannot identify the source of the disease; other than her husband, nobody was ever really exposed to her. We treat the husband. We don’t treat the woman; she’s not our patient; she’s the doctor’s patient. She interests us, but only because we’re concerned about the population around her.

What benefit does it bring to put out a press release every time a case of meningitis occurs? None, because it doesn't have any direct impact on the health of the public.

This is actually an ongoing discussion with a couple of media outlets in New Hampshire that get quite upset every time they realize there was a case that I didn't tell them about, but there is no information to give them in that particular case.

Now, what if you have a case of meningitis in a 14-year-old high schooler? You start looking. What does he do? Where does he go? Almost as soon as you start the investigation, you find a second case. Right then, I go public, not to create panic, but because I need the information to flow incredibly quickly. What if we are missing something because this kid is unconscious in an intensive care unit, or, perhaps, he won't tell me whom he kissed; whom he had sex with; whom he smoked marijuana with or shared a cigarette or toothbrush with? I go public.

Now we have two cases of a particular disease in a school. We are investigating, identifying the cases. We never identify the patient, but that's tricky for us because if we're asking for information without identifying the person we're talking about it becomes complicated. Most of the time, though, the community knows and will help us identify things.

In another example, a month ago we received a report of a patient who died and the clinician thought the person had Creutzfeldt-Jakob disease—a protein-particle disease related to Mad Cow Disease. Just the mention of Mad Cow creates anxiety in a lot of people, but we don't release the information because we don't actually have Mad Cow Disease; we have somebody who died with a disease that you see once in maybe a million deaths a year. What we do, however, is start investigating and, in this case, we found out that the person had brain surgery before he died—the alarm bells start ringing.

Confirmation of the diagnosis takes a month. Do I sit on that, or do I act? Typically, we would act, and we did. I called a bioethicist and asked him to help me out, because nobody in recent American history has dealt with a situation like this. You have a person who had dementia symptoms and had brain surgery, and the equipment that was used on this person was then used on eight others. There was a piece of equipment that came from out of the state, was used on this patient, and was then sent back out of the state and used on patients in two other hospitals outside of New Hampshire. The national recommendations are to wait until the case is confirmed. But what is the balance of risk? What if this is a case of Creutzfeldt-Jakob disease? What if any one else was exposed to it? Should we wait the four weeks not knowing? We decided not to wait. Dealing with the information that we found, thought, or feared, was really important to the public so we went public.⁷

These were three different scenarios, all of them real. Getting it right is incredibly tricky. The media's mantra is "if it bleeds, it leads." That's why the news broadcasts start with the fire, follow with the car accident, and *then* get to the change in national policy. As consumers, we ask for that and they deliver. When you open the browser on your computer, you typically don't go to see what the latest change in policy was; you go for the funky picture with the bleeding car.

I am incredibly careful and mindful of our interaction and relationship with the media and make every effort to provide proper information. No one other than the infected patients needs to worry about the flesh-eating bacteria, and I don't want people panicking and doing stupid things. But at the same time, I'm not going to lie to the public—everything I say is on

⁷ This diagnosis was eventually confirmed.

camera and live. Somebody is going to come back to haunt me with whatever I said in a particular forum or setting.

No no, we don't withhold information. Rather, we strive to be first, to be accurate, and to be right. When I don't know, I will say so. I'm not going to make it up. If I make it up and I'm wrong, somebody's going to let me know and it won't be fun.

Question #7: I'm curious about your take on the concept of eradication—like with smallpox. The virus does still exist [in labs] and the vaccine does exist, so from the point of view of preparedness... what if? How do you approach that as a public health officer, practically? What's your take on the decision, for example, not to vaccinate people for a disease like smallpox? Is that smart, because the risks outweigh the chance of getting the disease?

Response: We don't have polio in the US and we do still vaccinate. In general, we don't have diphtheria in the US but we still vaccinate because the virus is circulating around the world. In Syria right now [in 2013], with the civil war, they've had outbreaks of polio—it's a disease that can still come.⁸ The problem that we face as a society, and I face as the head of public health, is that nobody in this room has ever seen a case of polio. Nobody here has ever seen a case of diphtheria. I have seen only one case of tetanus in my life, and that was in a different country. People don't realize that these things can actually happen and when they do, they are quite severe. For such diseases that are still circulating, we still need to vaccinate everybody—if we don't, they will come back. It may not impact me, because I am already vaccinated and immune, but it will impact our children, and they will die, and that's the problem.

Smallpox is a whole different animal—it's the only disease that, through vaccination, we have eradicated from being a human harm. But we are faced with different discussions: Do humans have the right to kill the virus? If we do, we will have eradicated something that was natural in the world—that's one dilemma. In theory, there are two big reservoirs of smallpox in the world, one at the CDC and one in Russia, somewhere in Russia. So, a second discussion is: Do we vaccinate or not?

My opinion is no, we don't. The disease is not circulating and there is no imminent risk of it re-emerging. However, that doesn't mean that we shouldn't vaccinate selected groups. I was vaccinated against smallpox 10 years ago because if we do have an outbreak, we need a group that can take care of the first set of patients as we start vaccinating people again. Smallpox vaccine was developed at a time when the disease was fatal to 30 or 40% of sufferers. In the face of that statistic, a vaccine that caused severe complications in 10% of recipients was acceptable. But I won't give that vaccine to the general populace when the disease does not exist. I simply cannot afford the risk. People get really mad at me when they get a fever or headache from a flu vaccine. Imagine the uproar if people died or developed encephalitis or other big, severe complications from a smallpox vaccine! So, we don't vaccinate, and I won't ask people to be vaccinated population-wide. In fact, we are now struggling because we should give boosters of the smallpox vaccine every 10 years—who among the people I vaccinated in my office 10 years ago are still with me and should be re-

⁸ Polio is not endemic in Syria in March of 2017.

vaccinated so that I have a small, five-person cohort ready to go out and immunize the whole population should we ever need to?

CLASS EXERCISES

Management of SARS

- Divide the class into groups that will represent Hong Kong, Vietnam, Canada, and the United States.
- Each group is responsible for researching—via the Internet—how their respective country first identified Severe Acute Respiratory Syndrome (SARS), the number of cases of those sick with the disease, and the number of those who died from the disease.
- Each group is responsible for researching—via the Internet—how their respective country managed SARS (i.e., who was involved in disease management and what specific policies were implemented).
- Each group will critique their respective country's response to SARS and propose a new management strategy for the next novel disease outbreak.
- Each group will present their strategy to the class.

Public Health Preparedness

- Divide the class into groups that will represent different states in the nation.
- Each group is responsible for researching—via the Internet—the pandemic flu preparedness plan for their respective state.
- Each group should identify as many components in the plan as possible that relate to Dr. Montero's lecture. For example, what is the organizational structure in the event of a flu pandemic? Who is in charge? Identify any other organizations that are involved. Is there an organization that is not involved but which you think should be involved? Explain.
- Describe the plan to identify those you should vaccinate first. Do you agree with the state's rationale? Explain.
- When will isolation and quarantine measures be implemented in the plan?
- Describe the plan to manage mass casualties.
- Each group will present a brief overview of their respective state's plan, highlight the two or three most important points in the plan, and explain the rationale for their selection.

ABOUT THE AUTHOR

Dr. Montero served as the Vice President of Population Health and Health System Integration at Cheshire Medical Center/Dartmouth-Hitchcock-Keene in New Hampshire. He is the immediate past Director of the Division of Public Health Services (DPHS) at the New Hampshire Department of Health and Human Services. As Director of DPHS, Dr. Montero led the development and implementation of policies that helped create the conditions to improve and maintain a healthy population. For this process, he relied on two key strategies: the development of a systematic approach for actionable data collection, use and dissemination, and a better coordination of the public health systems and the health care system, with a clear expectation of population health improvement. He has brought this vision to his role on several academic and national policy committees, including the Association of State and Territorial Health Officers (ASTHO).

Dr. Montero received his MD from the Universidad Nacional de Colombia. He specialized in Family Medicine, receiving his degree from the Universidad del Valle in Cali, Colombia and a degree in Epidemiology, from the Pontificia Universidad Javeriana in Bogota, Colombia. He received a Masters in Health Care Delivery Science at Dartmouth College.

Dr. Montero also fulfills several national roles. He is the Past-President of the Association of State and Territorial Health Officers (ASTHO). He serves on several committees including the federal Advisory Committee on Immunization Practices (ACIP, as ASTHO Liaison), the Centers for Disease Control and Prevention’s Board of Scientific Councilors for the Office of Infectious Diseases, the Centers for Disease Control and Prevention advisory committee to the Director, and the advisory subcommittee for the Office for State, Tribal, Local and Territorial support. He is a member of the Institute of Medicine’s Roundtable on Population Health and a member of the National State Policy Academy. Dr. Montero serves as Co-Chair of the Health Promotion-Disease Prevention pillar of the New

Hampshire Citizen Initiative and as a member of Dartmouth Medical School Leadership Preventive Medicine Residency Advisory Committee. He also served as a board member of the New Hampshire Foundation for Healthy Communities.

Chapter 83

FROM SMALLPOX TO POLIO: HOW AMERICA EMBRACED VACCINES

M. Girard Dorsey*, PhD

History and Justice Studies Program at the University of New Hampshire, USA

INTRODUCTION

The theme of the Sidore lecture series inspired Dorsey's essay in which she discusses events and decisions related to personal liberty and bodily integrity. This chapter is included in the book to show a historical trend that deepens our understanding of American society's general willingness to use vaccines. The three examples she discusses are smallpox inoculation in colonial Boston, diphtheria toxin-antitoxin injections in early twentieth century New York City, and the polio vaccine trials of 1954. While Dorsey acknowledges that not all Americans react positively to all vaccines at all points in the history of the US, she demonstrates that there are noteworthy examples when significant portions of the lay population involved in key vaccination drives embraced vaccines. This occurred even at times when science had not proven a vaccine's effectiveness, such as in colonial Boston, or when there were no governmental mandates driving vaccination, such as in the polio trials. Sometimes popular support for a vaccination campaign occurred even in the face of official and expert opposition or debate among experts. In other words, these campaigns were not solely driven by governments or even scientific or medical experts attempting to convince lay populations to accept vaccinations because of legal compulsion or simply because of trust in science. Thus, at key points in US history we see that there has been a partnership between a lay population and segments of the scientific or governmental communities to adopt vaccines; implementation of vaccines has not always been the result of a top-down imposition of policy, nor has the growing acceptance of vaccines been a strictly scientific or legal story.

ESSAY

Polio scholar Jeffrey Kluger tells a story about an anonymous woman in 1955 who was so desperate for her child to receive an early version of Jonas Salk's polio vaccine that she acquired it illegitimately, visited a doctor's office, told the physician to inject her child, and ordered him to ask no questions about the vaccine's origin.¹ The new vaccine was not 100% effective, as a recent study had proven. It certainly was safe, and it provided protection against polio, but some children who received it would nevertheless succumb to the disease.² Still, at a time when there was no cure and no effective treatment, this was the best that medicine had to offer during a decade when polio attacked tens of thousands of children every year in the US. The public embraced the vaccine and parents *chose* to have nearly two million children—an incredible number—take part in the polio vaccine trials in 1954; they did not participate because the law compelled immunization. Hundreds of thousands of citizens volunteered to help administer the national trial; they did not take part because the government pressured them to do so.³ Instead, people participated—as recipients of the experimental vaccine and as enablers of the trial—because they had been educated about the vaccine's potential and because they believed in the need for a polio vaccine.

It is not inevitable that vaccines be accepted by laymen as standard tools for disease prevention. Vaccines are, by definition, an intrusion into personal autonomy. To prevent a disease, someone injects chemical and biological matter into another's body or, in the case of inhaled vaccines like FluMist, blows the matter into the patient's nose. Today, most vaccines are given to children, people who have no say in whether or not they get a vaccine. Thus, the debate about vaccines infringing upon personal liberty is really centered on whether the government may *compel* someone to get a vaccine or whether an individual (or his or her parents) may *elect* to get the vaccine. It must be said that as it is always illegal, in this country, to hold someone down in order to administer a vaccine; there has to be some element of volition.

Today, studies reveal that the vast majority of Americans accept vaccination as a shield against disease.⁴ While no one looks forward to getting a shot, anecdotally it is clear that for most who do get vaccinated it is, at worst, a routine chore, and at best, a moment to be grateful for modern medicine. The majority of concerns are inconvenient side effects, such as fevers or sore arms, and the bulk of frustrations are about scheduling and cost. There are legal requirements in place, but probably they serve as tools to encourage families to vaccinate children on a particular schedule—it is more of an incentive to take the time to visit the doctor in a timely manner than to convince patients of the benefits of vaccination in the first place.

No attitude is universal, of course. There is a recognizable minority that resists vaccines for religious or philosophical reasons, and there are others who abstain from optional vaccines, such as the annual flu shot, for reasons of convenience or lack of faith in that

particular vaccine.⁵ There are some who cannot be given vaccines because of medical reactions to the ingredients. There is also a distinct minority who rejects vaccines because it fears government conspiracies about the ingredients or is convinced that they cause harms such as autism. In general, though, vaccines are a normal, accepted part of medicine, and a very common part of standard medical care for children.

It has not always been so. At different times in American history, vaccines have not been embraced for a variety of reasons. At times vaccines have been forced upon the public and challenged by patients fleeing syringe-wielding officials. For example, these reactions occurred in some US cities around the turn of the twentieth century in response to localized campaigns to vaccinate against smallpox.⁶ One of the most famous instances of resistance was Pastor Jacobson's stand against the mandatory smallpox vaccine in turn-of-the-century Boston: Jacobson believed the vaccine endangered him because of his physical or genetic make-up. The case was immortalized in *Jacobson v. Massachusetts*, the US Supreme Court case that rejected the pastor's appeal and that authorizes mandatory vaccinations to this day.⁷

At other times, scientists and governmental authorities have sold vaccination, and its forerunner, inoculation, to the American public as a legitimate, useful tool, and sometimes, a medical marvel.⁸ The fact that vaccines are now considered routine by most people is proof that they have become effective and safe. However, this is not just a top-down, one-way story of governmental and medical officials selling or compelling the public to get vaccines. At times significant segments of the public have helped to sell—as well as to buy—the idea of vaccinations. A key thread of the vaccination narrative, therefore, is that of a partnership, with the public seeking to engage actively in vaccination campaigns. In specific campaigns, the audience has sought to participate through fundraising and vaccine administration, as well as by seeking access to both experimental and proven vaccines.

Furthermore, the campaigns to sell vaccines have not always revolved—or at least, not solely—around confidence in science. They have depended upon non-scientists, upon techniques associated with advertising, upon parental desires to protect children, and upon other factors beyond the world of laboratory science and medical professionalism. The story of our embrace of vaccines, therefore, includes case studies that illustrate that scientific progress and acceptance does not happen in a vacuum; emotional factors, lay enthusiasm, accessibility, and other factors, all helped to shape the increased popularity of vaccines.

While vaccines have traditionally been seen as a battlefield between the government and the individual, sometimes the government plays a very minor role—as in the Salk vaccine

⁶ In Michael Willrich's book about the history of smallpox vaccination in the United States, he describes several protests in a variety of locations and over time. Michael Willrich, *Pox: An American Story* (New York: Penguin Books, 2011).

⁷ Willrich, 285–366 describes the story of *Jacobson v. Massachusetts* in detail.

⁸ Note that the very title of Kluger's book about polio is *Splendid Solution*, which refers to the Salk vaccine to prevent polio.

trials or the New York diphtheria campaign—or an unexpected one—as in colonial Boston. Sometimes, the public even makes the free choice to be on the same side as the government.

To illustrate this, and to understand how the long-term history of American vaccination has helped shape cultural attitudes and behaviors towards the process today, it is worth looking at three major diseases and key points in the distribution of their associated vaccines: smallpox in colonial Boston; diphtheria in New York City, 1929 – 1931; and the Salk polio vaccine trials across the US in 1954.

SMALLPOX INOCULATION

The first major vaccination effort in what would become the United States involved neither vaccinations, technically speaking, nor a governmental campaign. Instead, the focus of effort was on the *opportunity* to get inoculated against smallpox in colonial Boston.

Smallpox is a disease that once terrified the world's populations. Today, it is eradicated, living on only in a few laboratories and in our fears of bioterrorism. When it circulated naturally in the world, smallpox was a disease that could appear anywhere, any time. When it did emerge, it could cause epidemics with fatality rates of up to 30%. Scars often disfigured survivors and blindness could handicap them. As with many viruses, there were versions of the disease that were relatively minor. The worst strains, however, demanded fear and attention. They not only killed in great numbers, but also in a gruesome manner. Victims died slowly, painfully, and visibly, suffering from high fevers, vomiting, and erupting pustules.⁹ There was nothing anyone could do for victims except provide palliative care. The one method of prevention was to avoid the disease, through isolating the sick or quarantining the potentially sick. The one blessing was that if you caught the disease and survived, you were immune for life.

In colonial Boston, news of a technique to stave off fatal smallpox caught the attention of physician Zabdiel Boylston. As importantly, it also intrigued Cotton Mather, the most prominent clergyman in Boston in an era when religious figures wielded enormous social as well as religious power.¹⁰ The technique was inoculation—the insertion of a minimal amount of smallpox from one victim's pox into a cut in the arm or leg of a healthy individual. Ten days or so after the procedure, the recipient would become sick with smallpox. If everything were done correctly and the patient had a robust immune system, the case would be mild; the recipient would get well and possess a lifetime immunity to any kind of smallpox. He traded a short-term illness, albeit a serious one, for lifelong protection.

This is, of course, not quite vaccination but is, rather, the forerunner of it and served the same purpose. It was not invented in Boston in 1722—as Boylston and Mather knew—but had been practiced in Africa for some time. Still, it was new to Boston, both because it was a novel way to prevent smallpox in North America and because inoculation was an innovative idea to the settlers.¹¹ Even so, for some residents of Boston, the risk of inoculation seemed

⁹ For more details, see “Smallpox Fact Sheet: Smallpox Overview,” *Centers for Disease Control and Prevention*, updated January 15, 2016, accessed January 19, 2017, http://www.ct.gov/dph/lib/dph/communications/cerc/smallpox_fs_web.pdf.

¹⁰ John B. Blake, “The Inoculation Controversy in Boston: 1721–1722,” *The New England Quarterly*, 25, no. 4 (Dec., 1952): 490–492, accessed January 19, 2017, <http://www.jstor.org/stable/362582>.

¹¹ *Ibid.*

much smaller than the risk of catching smallpox naturally, and approximately 200 people came to Boylston to try it.¹²

In eighteenth-century Boston, religion influenced law, public opinion, and culture, and it was vital that both a clergyman and a doctor together endorsed the new approach. This was an era in which physicians did not dictate medical matters, and supporters—as well as those who underwent inoculation—faced substantial opposition. One might think that people scared of smallpox, people who knew how grisly dying from smallpox could be, to say nothing of the high rate of mortality associated with it, would embrace any method of avoiding the disease or limiting the damage it inflicted, especially in the middle of a local epidemic. That was not the case, however.

There were clearly some potential philosophical and scientific problems with inoculation. First, it is dangerous to infect an individual deliberately with the contents of a pox gleaned straight from someone else's body. Consider the following issues: Is that the right disease? Will the right amount be transferred? Will the technique communicate another disease, perhaps through an unsterile tool, that will make the recipient ill? Second, once the recipient has been inoculated, will he communicate smallpox to someone else, perhaps a caretaker or a member of the public, while he is sick? Will he, in fact, start an epidemic? There were also moral and philosophical problems: should doctors insert diseased material into a healthy person? If the Hippocratic oath orders, "First do no harm," then how can a doctor deliberately make someone sick, even if the goal is to protect him or her for the future?

Dr. William Douglass, a powerful and vocal physician, was a leading opponent to Boylston's inoculations. It was wrong, he said, according to the laws of God and man, to poison someone. Furthermore, it was dangerous, risking the health of the recipient and his community, especially since Boylston did not take strict precautions to quarantine the recipient and his caregivers while he was contagious. In return, Mather argued that Africans had been inoculating for years; this was not a new-fangled or unproven technique.¹³ Rather, it was a confirmed method of preventing a great danger: an epidemic.

Boston's epidemic lasted just over a year. Of Boylston's roughly 200 inoculated patients 2–3% died, and he claimed that those victims died not from the inoculation but from other causes. Overall, in a city of 11,000, some 6,000 caught smallpox and 15% of those sufferers died.

Nevertheless, officials were not convinced. Instead, the tried-and-true method of quarantines remained the only legal, as well as the dominant, method of preventing smallpox. Soon, the city enacted laws banning inoculation.¹⁴ Unlike today's arguments that compel an injection for the sake of the general public's health, here was an authority banning individuals from taking a personal risk for fear that it would endanger others. Yet, some 200 people believed that the risk was worth it, and they were sufficiently convinced to go against the

¹² "The Boston Smallpox Epidemic, 1721," *Harvard University Open Collections Program, Contagion: Historical Views of Diseases and Epidemics*, accessed January 19, 2017, <http://ocp.hul.harvard.edu/contagion/smallpox.html>.

¹⁴ "Mass Moments: June 26, 1721: Dr. Boylston Experiments with Smallpox Inoculation," *Massachusetts Foundation for the Humanities*, June 26, 2005, accessed January 19, 2017, <http://www.massmoments.org/moment.cfm?mid=186>.

majority and to take the time, effort, and risk to seek out a doctor for a procedure that was new and had no proven track record. Of course, the danger of the disease itself partially convinced them, as did the support of two prominent members of society. Specifically, Mather's public verbal support, as well as his evidence—although based on hearsay—of African experiences with the technique helped to persuade people. And Boylston's evidence that he had subjected his six-year old son and two slaves to inoculation also provided convincing data.¹⁵ Some Bostonians were, indeed, sold on the idea that science could provide protection, even when the medical technique was, in some ways, outlandish. It is all the more remarkable when one remembers that medicine at the time lacked knowledge about the germ theory, antisepsis, and many other scientific discoveries that have since helped make doctors effective healers.

Smallpox vaccination did become more accepted over time, especially once Englishman Edward Jenner developed the cowpox variolation technique of transferring cowpox to humans in 1796, which provided humans with immunity to the related smallpox but did not risk an epidemic. However, during the eighteenth century, when inoculation was still the method used, and even into the twentieth century, after vaccination had been developed, people have rejected smallpox vaccines in different places, at different times, for a variety of different reasons.¹⁶ It has certainly not been a universally popular vaccination, partly because of its side effects.

However, to recap, it is important to realize that even before the science behind vaccination (and inoculation) gained the trust of the wider population, there were debates in public between those trying to prevent inoculation and those trying to sell it to the public. The legal role was the opposite of that seen today: it sought to prevent vaccination rather than require it. Yet, a substantial minority in Boston actively risked public censure to seek out a vaccine with no local track record. This group, then, participated in a partnership with Dr. Boylston to gain immunity. It is true that 200 or so people did not constitute a majority or even sizable portion of the population, but it is still an impressive number when one recognizes the novelty of the inoculation process and that the patients hazarded social and legal consequences in order to take a stand. Today, it is the “anti-vaxxers,” those who reject vaccines, who are the minority, but in colonial Boston, with the “pro-inoculators” we begin to see the first steps in the general public embrace for vaccines.

So, what happened next?

THE DIPHTHERIA PREVENTION COMMISSION

A major turning point occurred in the 1920s and 1930s when New York focused on diphtheria, one of the next diseases for which doctors developed a preventive. Unlike smallpox, diphtheria is still in circulation, although the CDC says there have been fewer than five cases in the last ten years in the US. Diphtheria is the “D” in the DPT (diphtheria-pertussis-tetanus) shot that every schoolchild gets and that many adults receive as a booster.

¹⁵ Blake, 492.

¹⁶ For some examples, see Willrich and “The 1730 and 1774 Marblehead Riots against Smallpox Inoculation,” *New England Historical Society*, accessed January 19, 2017, <http://www.newenglandhistoricalsociety.com/1730-1774-marblehead-riots-smallpox-inoculation/>.

While pertussis (better known as whooping cough) and tetanus are the diseases of most concern today, diphtheria, in its heyday, was a killer, particularly of children. It could have a fatality rate of 50% of its victims before a treatment was developed, and as an example, more than 200,000 children caught it in the US in 1921.¹⁷ It was a major threat.

What is diphtheria? Diphtheria does not kill everyone, nor does it kill as spectacularly as smallpox. It is an upper respiratory illness in which bacteria produce toxins that can damage many parts of the body. It is most well-known for destroying parts of the respiratory tract, and the dead cells make it challenging, if not impossible, to breathe.¹⁸

The facts that it was not only a potentially fatal disease, but also one that targeted children, particularly those of nursery-school age, were major factors in the campaign to convince parents to protect their children in the early twentieth century. Another key element was the timing of the effort. The 1920s and '30s were a golden age of advertising development; the confidence in marketing and the techniques available made it reasonable and feasible to mount a widespread and varied campaign.

Then, of course, there was the science. Medical science had made great strides since the days of colonial Boston. The development of the germ theory of disease, new technology such as x-rays, and new medications such as aspirin, made mainstream medicine more effective and trustworthy. The most important of these was the germ theory. The recognition of germs, particularly bacteria, led to a focus on scientific medicine in laboratories, and applications of this work included the tests for diphtheria immunities as well as anti-toxins.

The most famous diphtheria vaccine was, as in the colonial smallpox story, not actually a vaccine. It was a toxin-antitoxin, and its spectacular popular success belied the fact that it may not, actually, have been responsible for all the drops in the number of annual cases of diphtheria in New York between 1929 and 1931. Since the disease peaked and ebbed in New York in multi-year cycles, reductions in childhood diphtheria cases may have been the result of natural ebb as well as the impact of the vaccine, especially during the first year of the campaign. Still, the campaign of the late 1920s was and is recognized as a successful vaccination effort.¹⁹

The key component of this so-called vaccine was an antitoxin. An antitoxin is a mixture that treats, or combats, the toxins in a disease. A vaccine, of course, prevents the disease in the first place. Yet, by mixing the diphtheria antitoxin with the toxin, and then injecting it into healthy children, the effect was, in laymen's terms, to give them and treat them for the disease simultaneously. Before this—even once scientists knew about the efficacy of antitoxin—antitoxins were only administered to an already sick child. Thus, unlike with smallpox, there was a treatment before a vaccine was available.²⁰ However, the antitoxin alone did not always work.²¹ Children could, and did, still die, and those around them could, and did, still get sick. The toxin-antitoxin injections thus logically appeared to be a much better approach, not only in decreasing fatalities but also in avoiding the disease entirely.

²¹ Hammonds, 123.

There was another development that made the campaign worthwhile: the ability to test for diphtheria immunity. There are some diseases, such as smallpox, that leave visible traces on their victims. Smallpox survivors are known for the scarring that the pustules leave behind, including on their faces. Anyone can recognize them. Until recently, recipients of the smallpox vaccine revealed their protected status because of the special scars that the vaccines left on their arms: lines and dots in a pattern an inch or so wide, that indicated where a stylus (or point) scratched the skin to inject the cowpox derivative. What could not be shown, however, was how long ago the vaccine had been administered and whether it had immunized or still protected the recipient. (The smallpox vaccination was not like the smallpox inoculation that gave permanent protection to those who received it.) In 1902 in Cambridge, Massachusetts, for example, the authorities required revaccination if an individual's last vaccination was five or more years ago.²² Diphtheria was different: a test was developed to indicate whether or not an individual was susceptible—the Schick test.

In the Schick test a tiny bit of toxin was injected beneath the surface of the skin to see if a red or brown skin reaction developed. A medical expert “read” the site every 24-hours for four days. The true “positive,” or “absence of immunity to diphtheria,” could be distinguished from false positives, or “pseudo” reactions, partly by recording the length of time that the injection site remained discolored.²³ Depending upon the results, it was proven that the tested individual either had or did not have current immunity to diphtheria. While the test was theoretically simple to administer and read, the clearest results came from using control tests and true Schick tests simultaneously. A patient received heated toxin (one in which the diphtheria proteins remained but the toxin was inactivated) in one arm and the live toxin in the other arm, thus ensuring that any redness did truly come from the toxin and not the proteins.²⁴ Giving the test could save time and money as well as provide reassurance. Medical practitioners and parents would know whom to vaccinate. As important, perhaps, was the confidence it inspired: parents *knew* their child was safe from diphtheria, and they had more reason than before to believe in scientific methods providing that protection.

The ability to provide such a shield against diphtheria, an invisible shield, was believable—and so easier to sell—if you could prove that it truly was an effective barrier to the disease. Yet those who pushed the importance of the diphtheria toxin-antitoxin did not leave it just to logic. Non-legal tools and community members, from individuals to non-profits and commercial businesses, actively participated in a campaign of education, the administration of a campaign to vaccinate young children, and the provision of patients to vaccinate.

Of course, the campaign also involved medical personnel, but not the same medical personnel as would be most heavily involved in vaccine efforts today. Before the 1929 campaign, people did not usually go to a doctor's office for the diphtheria toxin-anti-toxin shot either routinely or preventively.²⁵ Instead, you consulted a doctor for antitoxin after you caught the disease or were exposed to it. New York wanted to change that. Here was a chance to show that laboratories and public health could work miracles. If enough children were

²⁵ *Ibid.*, 203.

vaccinated, perhaps a whole disease could be “eliminate[d] . . . in New York City within two years,” or at least fatalities could be greatly reduced among the vulnerable population of children.²⁶

How should or could New York do this, though? How do you find the appropriate-aged children? How do you convince them (or rather their parents) to get the toxin-antitoxin? How do you keep track of the records? What about the costs? The fact that family doctors were not particularly involved—this was a public health measure, not a private medical endeavor—made it all the more confusing.

It turns out that among the most important tools at the disposal of the campaign were volunteer groups, but not necessarily ones with any medical training. The local branches of the Junior League, a national women’s group, and the Lions, a national men’s service group, were two of the most active organizations. In the town of Newburgh, near New York, Junior League women took on the painstaking job of searching through census records to find the names, ages, and (hopefully) current addresses of nursery-school age children. The Lions Club offered lollipops to those who received shots.²⁷ (Decades later, Dr. Jonas Salk would provide lollipops when he gave the first polio vaccines, too.)²⁸

Still, more efforts had to be made to inform children and their families at the neighborhood level. Some of this information did come from organized public health entities—nurses visited homes trying to sell the idea. But why not make it fun and add a dash of peer pressure? Public schools competed with one another to see which could get the most children vaccinated. Others gave out tokens indicating that someone had been vaccinated, such as a badge one could wear and show off.²⁹

The media sold the campaign in myriad ways, in newspapers and on the radio, through editorials, news stories, and advertisements. Politics and the media combined when one mayor created a photo op out of his children’s vaccinations—it was one more way to promote the toxin-antitoxin.³⁰

Yet, it was not simply a competition or an advertising campaign. This was serious business, and the organizers noted that in their approaches. In the nineteenth century, for example, women had been told that, since cleanliness and health were connected and they were in charge of housekeeping, they were responsible for much of their family’s well-being. Now they were told that it was their fault if a family member fell ill with a disease associated with diphtheria, in part because they could prevent the disease through vaccination.³¹ Thus, the stick of moral persuasion was used as well as the carrot of possible protection. What was not part of this campaign was the legal compulsion we see today, even though it did exist for smallpox in some districts at the time. No school banned children who had not been

vaccinated. Such leniency avoided the resistance— sometimes violent resistance—that had been seen towards the smallpox vaccine at various times around the country.³²

There is one other factor that was critical to the campaign: how to pay for it all. The campaign organizers were clever and sought substantial private funding, both from business and from a charity. Met Life, an insurance company, was a smart choice.³³ It had a vested interest in having children grow up to buy insurance, and also saw campaign support as a way to increase its positive profile among those who could already buy insurance.³⁴ Met Life had more utilitarian motives, too. As the company's leading statistician, Louis Dublin, determined, "childhood illnesses such as diphtheria cost American society some \$200,000,000 [in 1920s dollars] per year in medical and nurses costs and lost parental wages."³⁵ It was only smart to try to eliminate diphtheria. On the other hand, the Milbank Memorial Fund had a very different motive. The Milbank Memorial Fund is a non-profit organization set up in 1905 to apply health policy.³⁶ While it had sponsored work with other diseases, such as tuberculosis, diphtheria hit close to home: one of the founder's son had died of it in the late 19th century.³⁷ It is, perhaps, not astonishing that the Milbank Memorial Fund provided the majority of support for the New York City diphtheria toxin-antitoxin efforts.³⁸

With so many groups working towards the same goal, it is not surprising to learn that diphtheria rates did fall after the campaign got underway.³⁹ However, there were problems.

The first was that the lowered death rate did not stay lowered.⁴⁰ As the first flush of campaign effort fell away, fewer children were vaccinated. But each year there is a new crop of young children who are the right age to vaccinate, so any vaccination project is, by its nature, never-ending.⁴¹ Another issue arose some time after the campaign: only then did scientists recognize that healthy carriers (those who did not get sick from diphtheria but could infect others) also had to be controlled, if the disease were to be eradicated.⁴² However, the problem that most directly related to the ending of the campaign was that attention and sponsorship faded. It required more effort to get the vaccine after the campaign ended; innovative ideas like the "snow-removal trucks that...[carried] physicians and nurses [and] toured the city" to immunize "thousands" were no longer employed.⁴³ In addition, there were other diseases and issues that caught peoples' attention. There is a loss of excitement once the first wave of success has been felt, and the fact that the campaign's leaders declared "success," may have led some families to believe diphtheria was no longer, or at least less of,

³² Willrich discusses these in detail. Note that there have been a variety of reasons for smallpox vaccine resistance including catching diseases from contaminated tools used for vaccinating and side effects such as sore arms that make it difficult for working class men to earn a living temporarily.

a threat, even though the city had not met its goal of eradicating the disease.⁴⁴ For these, and more, reasons, rates of vaccination decreased and rates of illness increased.

Nevertheless, the very fact that the campaign worked to increase rates of vaccination meant that public perception was that the campaign was a success. In many ways, it was.⁴⁵ First of all, it was an example of cooperation between many groups; it was not a top-down campaign aimed at a passive public. The 1929 Diphtheria Prevention Commission, for example, brought together more than 50 leaders within the New York City community, and its sub-commissions included a technical consulting board (representing private physicians and five medical societies) as well as an editorial consulting board (with 32 newspaper editors).⁴⁶ In addition, there were politicians and public health professionals who endorsed the campaign, as well as volunteers who helped on a day-to-day basis. Schools, and their teachers and administrators, also fostered immunization, as did others. Parents voluntarily brought their children to be vaccinated. In short, respected and helpful individuals from myriad fields came together to create a multi-pronged campaign.

While the focus of the project had been to eradicate diphtheria in New York City (something it failed to do), it had the subsidiary goals of raising public awareness of diphtheria and creating the view that it was a disease that could be defeated.⁴⁷ It also championed science; science, in the form of bacteriology and medicine had led to a routine use of a test to check for diphtheria antibodies (and thus immunity levels) as well as a way to prevent (not just treat) diphtheria through vaccination. The narrative made science the hero, and those who failed to protect their children (particularly the parents, and especially the mothers) the villains. Such ideas could be used in the future. Indeed, even today, those who opt out of vaccination are often vilified as rejecters of science and reckless with regard to their children's health, whether that is their rationale or not.

Ironically, many scientific issues were ignored at the time of this story. For one thing, global experts did not necessarily believe that the best way to prevent diphtheria was through the toxin-antitoxin immunization at the core of the 1929 campaign. Instead, for instance, the French believed that a diphtheria toxin could be inactivated chemically, such as with formalin, and that the resulting "toxoid" could be used to vaccinate children. This version did not require injecting live toxin into children, nor did it need animal serum to make it; the toxoid could be frozen, was more stable, required fewer boosters, and immunized children for a longer period of time. On the other hand, it could produce side effects in older children.⁴⁸ In New York, the public did not hear about these options or this debate. Instead, the official story was straightforward; scientific nuances were unimportant.

Thus, in sum, once medicine produced the vaccine and the goal to eliminate diphtheria had been announced, there was widespread ownership of the efforts to achieve the goal. The methods used during the campaign itself were not particularly scientific, nor political, nor legal; instead, they were emotional, commercial, and voluntary—ones a lay population could engage and wield. The city government did not solely organize or run the campaign, either; as

one scholar noted, the “public sector” was critical if they were to vaccinate 522,243 children.⁴⁹

As impressive as these numbers are, though, the Salk polio trials involved almost four times as many children. How was that possible?

THE SALK POLIO VACCINES TRIALS

The third real-life example to consider is the development of the Salk polio vaccine. This is only one part of the polio story, but it is a more modern example of how vaccines—even experimental ones—need not be mandated to be popular. By virtue of the process that made it available, the Salk polio vaccine became known as the “people’s vaccine.”⁵⁰

As one scholar wrote recently, for most people in the US today the word “‘polio’ describes a vaccine to be taken, not a disease to be feared.”⁵¹ However, through history, at least as far back as ancient Egypt, polio has caused a potentially paralyzing illness and sometimes death. There are three strains of polio, each one of varying virulence. Thus, many victims of polio were only slightly affected; others were partially paralyzed; a few spent the remainder of their lives in an iron lung, largely immobile (there are still some iron-lung patients alive today); and some died.⁵²

Polio has come and gone over the years. At its height in the US, it was a disease that appeared in summer, and whether or not it hit hard in any particular year, people dreaded it. Families might not let their children swim in public pools or go to the movies in case they caught polio from someone in the crowd.⁵³ And it was children who were hit.

The fact that polio’s casualties escalated in the twentieth century—especially in mid century—is one reason that it drew so much attention.⁵⁴ The fact that, like diphtheria, it attacked children is another. Finally, one of its most prominent victims was Franklin Delano Roosevelt, a member of a famous and powerful family as well as a future US president. While FDR worked hard to hide visible reminders of his disability from polio, he could not hide the fact that he had suffered from the disease. He became associated with the National Foundation for Infantile Paralysis (NFIP—better known today as the March of Dimes, although currently that organization has turned its focus from polio to birth defects) and his profile and work on behalf of that organization drove a campaign to care for polio victims and then to prevent the disease. Its work provided the basis for what has become a global effort to eradicate polio.

Efforts to create and distribute the first successful polio vaccine in the US began in 1955 and resulted in Jonas Salk’s creation. This was not the first time scientists had tried to prevent polio, nor even to find a vaccine.⁵⁵ Until there was an effective vaccine, however, the only

thing families could do was try to avoid the disease—and anyone carrying it. Local authorities would quarantine houses and, if they deemed it necessary, hospitalize affected children with or without their parents' consent.⁵⁶

Unlike diphtheria, polio is caused by a virus, and it was well into the twentieth century before there was even a solid understanding of viruses. Once the understanding was there, there were issues about how to create a vaccine if, indeed, one could even be created. The largest debate was whether it should be a killed injected vaccine, or a live oral vaccine. (A killed, or inactivated, virus vaccine is one that takes the disease-causing virus and “kills” it—some scientists argue that a virus is not truly alive on its own, and cannot be “killed” in a technical sense—so that it cannot cause the disease but is still in a form that the immune system will recognize. This contrasts with a live, or attenuated, virus vaccine in which the disease-causing virus is weakened so that it should do no harm; this often results in better immunity but also risks giving the individual a case of the disease. Even once the question was settled, scientists would have to decide which polio strain should be used, what other chemicals would be in the vaccine, and other details.)⁵⁷

While the March of Dimes did not make the vaccine, it did provide financial support and guidance. It moderated the conversation between the top polio scientists in the US, in order to focus research efforts and encourage exchange of ideas. The vaccine was not the organization's only goal—it also raised money to provide care for those stricken—but it did become the focal point.⁵⁸

First, however, the March of Dimes had to raise money on an ongoing basis. In the Diphtheria Prevention Commission campaign in New York, the goal had been short-term: immunize the young children of New York City and eradicate the disease in two years. In the case of polio, the vaccine had to be invented and then children had to be vaccinated—it would not be a short-term project and those involved knew this.

There were, nevertheless, similarities to the diphtheria campaign. Firstly, the public would have to be informed about the campaign before it could take off so that ordinary citizens would want to participate and would know how to get involved. Next, the population had to believe that science could provide the answer—eventually in the form of a vaccine. Broadcasts, like the one given on CBS radio in 1953 announcing trials for a vaccine, would help spread the message.⁵⁹ Thirdly, the public would have a role to play: providing funding, moral support, and ultimately people—children to be injected with the true vaccine and the control substance, as well as adults to raise money, run trials, and help with vaccination drives.

The fundraising predated Salk's work on the vaccine and is worth looking at because it was wildly successful, even during the Depression and World War II when there were major societal events that, understandably, demanded the nation's money and attention.

Unlike the diphtheria drive, the March of Dimes sought most of its money from the grassroots level. The original signature event was the Birthday Ball. Held for the first time in 1934, this became an annual event and was replicated around the country. Nominally celebrating the President's birthday, the ball's main purpose was to raise awareness of, and fundraise for, the fight against polio. The balls would ultimately raise \$1 million—despite the

⁵⁶ *Ibid.*, 10-12.

⁵⁷ *Ibid.*, 237.

⁵⁸ Ogintz.

⁵⁹ Kluger 200–201. Other announcements were made, too. See, for example, Kluger, 222.

Depression.⁶⁰ Roosevelt's law-practice partner Basil O'Connor, who later led the March of Dimes, helped organize the balls. Any money raised went to Roosevelt's favorite polio center in Warm Springs, Georgia, and to the local communities that sponsored the event. Once the March of Dimes was established, the birthday balls became an integral part of the organization's fundraising.⁶¹

The March of Dimes not only raised funds, but also concentrated on increasing awareness of the disease and what the public could do to help combat its spread. In these efforts the organization decided to target the average individual. The benefit of seeking numerous donors, rather than just a few generous ones, was that smaller donations could add up to a large amount of money while simultaneously spreading the word about the March of Dimes and its activities. These were hard economic times and it was important to do much with the few cents that was all many people could spare. The "mile of dimes" fundraiser encouraged people to donate, literally, dimes—in the first year alone donated dimes amounted to \$200,000.⁶² Later, fundraising drives focused on mothers, the individuals perhaps most concerned about the disease and perhaps best able to encourage donations. By 1941 the March of Dimes mothers had raised \$435,000. And fundraising would become ever more creative. In 1950 there was a Mothers' March—a short but intense fundraising effort during which mothers went door-to-door collecting change—that brought in tens of thousands of dollars.⁶³

Nor did the NFIP stop with dimes. Its chapters held fashion shows, exhibitions of Harry Winston jewelry, and created official posters featuring children. After World War II, "federated giving" to the United Way lessened the amount of money that the March of Dimes gathered through its traditional methods.⁶⁴ But, the NFIP increased its commitment to protecting children from polio, and strengthened its determination to fund efforts to eradicate it. Ironically, the March of Dimes was assisted in its efforts by polio itself: Just as veterans were settling into peacetime life, starting families, and chasing the American Dream of a house with a picket fence and kids in the yard, waves of polio struck increasing numbers of children throughout the country. As one scholar noted, it "turn[ed] the postwar culture upside down."⁶⁵ The dangers of war now turned into dangers for babies and children. Awareness and horror spiked and the NFIP was in place to help spread the word. In 1946, a poster depicting a child victim of the disease placed polio front and center in the lives of all Americans, even if the disease was not a current threat in their neighborhood.⁶⁶

It was in 1947 that the NFIP began to fund Jonas Salk, just as it continued to fund other scientists. In need of a new project and research money, Salk applied to the NFIP, but for some time received support not for the exciting prospect of vaccine development but rather for the more basic work of typing strains of polio. Despite the March of Dimes' years of

raising funds and awareness, so little was known about polio that scientists were still trying to determine how many strains there were—a prerequisite for any vaccine development. It was not headline-worthy work, but it was straightforward, dangerous, and important.

Soon Salk had proven himself, and after some political wrangling within the NFIP, he managed to secure the organization's blessing, and funds, to start work on a killed-virus vaccine.⁶⁷ Before long he had developed a vaccine to his satisfaction, but even then he faced numerous challenges before the medical community could offer it to children as part of their regular preventive care.

Inevitably there were arguments within the NFIP. Not everyone was convinced that a killed vaccine could be both safe and effective. The prevailing thought was that a live vaccine would provide more protection—certainly longer protection—because it would stimulate the immune system more thoroughly. Albert Sabin, the man who would eventually develop the live vaccine, was particularly outspoken on this issue.⁶⁸ Then there was the dilemma about how large a dose and how many doses would be necessary to protect children with a killed vaccine. What kind of additional substances would be mixed with the vaccine, and would they be safe? In particular, the debate centered on adjuvants—in this case oil—added to the vaccine to stimulate the immune system and increase the longevity of protection. The problem was that if the adjuvant entered the blood stream it could cause death.⁶⁹ Injecting it just beneath the skin would work, but some scientists wanted Salk to omit adjuvants completely.⁷⁰ Another question was whether the vaccine would be safe: could it, in fact, give someone polio? This is always a risk in a live vaccine, of course, but might it be a problem with a failed killed vaccine? And, of course, there was the biggest question of all: would the vaccine actually protect against polio?

There were, then, political and scientific debates, but there were also emotional ones. Earlier attempts to find a vaccine had backfired and caused polio in those who received the shots.⁷¹ Such past experiences made officials less eager to approve vaccine trials. How could one really know that a new one would be safe?

Scientific debates led first to animal testing, and thence to small-scale testing on humans. At the time, American scientific protocol demanded both that the vaccine did not harm the test subjects and also that it might do them good. Some of the first children to be inoculated were in a home for young victims of polio. The idea was that they could not get polio again—at least not the strain that had originally felled them—but they would benefit from not getting another strain. Next, children from a home for severely developmentally disabled were tested, the rationale being that they would be particularly vulnerable to contagious diseases since they lived in close quarters.⁷² The children could not, however, be tested without the consent of their guardians—enough did give permission to provide sufficient positive outcomes to instill confidence in the vaccine.

⁶⁷ Kluger, 159.

⁷² Kluger, 175.

Finally, plans were made for a widespread trial in 1954. First among many important decisions to be made was who would produce the vaccine. During the trial, the March of Dimes planned to vaccinate approximately two million children, and corporations were required to manufacture doses on a massive scale. The scales were huge, but so too were the potential profits for those companies that could get in on the ground floor. It is worth recounting a conversation between a March of Dimes official and prospective pharmaceutical corporations in 1953. He asked how effective the vaccine had to be for its manufacture to be worth their time and energy. The numbers they gave were staggeringly low—one even said 15%. In other words, they believed there would still be a market for a vaccine that was only slightly useful; indeed, a vaccine that would be so ineffective in preliminary testing that the March of Dimes would not have approved it for large-scale human trials.⁷³

Once the companies were selected, they had to be trained in a very finicky process—purity and precision were vital if they were to reach the necessary standards of safety and efficacy. There were failures. The trial nearly lost government approval because some test batches seemed to cause polio in animal subjects. (In fact, the test monkeys had a different disease.)⁷⁴

Next, there was the structure of the trials to be considered. The gold standard by then, as now, was double-blind studies in which no one personally involved knew who received the real vaccine and who received a placebo. That way, no one could analyze the results influenced by their knowledge. However, Salk and others were concerned: would anyone sign up for a study in which their child might not get the magic preventive? Morally, how could Salk and the organizers deny children the vaccine? Because of this, several states agreed to participate without the double-blind system in place, planning instead to use children in first and third grade as controls. Second graders would be injected, since they were young enough to be at high risk of polio but old enough to be in school for regular attendance, while first and third graders would simply be observed to see if they caught polio more often than the second graders.⁷⁵

A few communities did agree to the double-blind procedure, but they joined the trials late. Scientist Tommy Francis—one of Salk's former mentors before the polio research—had a sterling reputation and was asked to oversee the analysis of the results. He refused unless the double-blind procedure was used. He believed that a trial without the double-blind procedure would not be legitimate science, and thus would be worthless. At the same time, the trial organizers did not think that morally they could deny the vaccine to those who had already agreed to participate. And so, new communities had to be found, ones eager enough for the vaccine that they were willing to take the chance that their children might be in the control group and thus get no protection—as long as there was a chance that they would be assigned to the group that got the miracle vaccine, they were willing to participate.^{76 77}

So it was that, in 1954, two million children, hundreds of thousands of volunteers, and numerous medical personnel came together. Volunteers tracked down parents who had not signed consent forms, washed needles (so they could be reused), offered lollipops to children,

⁷⁷ Oshinsky, 186–187.

found no-show children, and on and on.⁷⁸ Then came months of waiting. Waiting by families to see if the vaccine would work: would their children emerge unscathed from the current polio season? Waiting by scientists and the public for Tommy Francis's team to analyze the results: was the vaccine safe and effective?

Finally, in an almost circus-like atmosphere at the University of Michigan—Francis's professional home—he announced the results live.⁷⁹ The vaccine worked. Not perfectly—it had varying degrees of effectiveness for different strains—but it worked and it was safe. The path was open for tweaking and perfecting. And there was to be no charge for the patent, so corporations would receive it for free. It would become known as the “people's vaccine.”⁸⁰ Millions of people had helped finance the work to produce it, and millions would now benefit.

It was a major moment for Salk. He received piles of mail and an invitation to the White House, but his scientific colleagues were less impressed.⁸¹ He never received a Nobel Prize because the science behind his work was considered derivative rather than original.⁸² On the other hand, no one could deny that its application was incredibly successful.

The story does not simply end on that happy note, though. Later trials and batches did have failures. In the ensuing years, some children did get polio from poorly produced batches.⁸³ Eventually, Albert Sabin developed a live vaccine that subsequently dominated the market, partly because it was easy to administer and less expensive.⁸⁴ However, the last case of “wild” polio in the US was in 1979, and the country reverted to using a version of Salk's vaccine for reasons of safety.⁸⁵ (This vaccine is now bundled into the numerous shots babies get during their first few years of life, and the CDC recommends four doses by age six.)⁸⁶ The oral vaccine is still used in an effort to eradicate polio globally partly because it can be easily administered by anyone to anyone.⁸⁷ As of January 2017, the disease does still exist, but is endemic only in Pakistan, Afghanistan, and Nigeria.⁸⁸ (This is a reversal of the trend since polio has re-emerged in Nigeria since 2015).⁸⁹

Even now, volunteers outside the medical field are still deeply involved in eradicating polio. The Rotary Club, an international volunteer organization, has taken on polio as one of its major missions.⁹⁰ The Bill & Melinda Gates Foundation, so well-known for its anti-

malaria work, is another major donor.⁹¹ As in the years that led to the development of the vaccine, and through its major 1954 trial, there are major efforts from people wishing to see an end to the threat of polio. For the breakthrough—the Salk vaccine’s development and trial—people volunteered money, from pocket change (like dimes) to thousands of dollars.⁹² The NFIP, a non-profit, supervised most of the research and treatment efforts at the national level for decades. A President championed polio and brought it to the public eye because it was one of his personal philanthropic causes. Volunteers collected money and staffed trials. Children were the “polio pioneers,” as Salk called them, who received the first vaccines.⁹³ Whether or not they chose to participate in the trial, it was those children who bared their arms, received the shot, and took the chance. While the March of Dimes and the President helped to publicize the dangers of the disease and the possibility that science could prevent it, it was the public who chose to buy into the messages and actively promote the campaigns. The public—as donors, as fundraisers, as volunteer administrators during the trials, and as vaccine recipients—made this possible. Coercion was not involved.

CONCLUSION

Today, most Americans get their children vaccinated because of legal mandates, medical recommendations, and their trust in science. However, there have been times in our history when laymen have actively sought vaccines, sometimes in spite of government recommendations and experts’ debates, such as in colonial Boston. At other times, such as during the New York City diphtheria campaign and the Salk vaccine trials, segments of the public and lay organizations have sought to promote vaccination drives. Public embrace of vaccination has not always been a top-down process led by experts or promoted solely because of scientific trust, and understanding this may help future campaigns designed to educate the public and to convince them to trust their children to the doctor’s needle.

Class Exercises

The Great Debate

Think about the colonial smallpox inoculation debate. Break into two groups, one on the side of Boylston and Mather and one on the side of Douglass.

- What were some of the reasons raised in favor of inoculations and some of the reasons raised against it?
- Each side should argue one side or the other in a debate.

⁹¹ “Polio,” *Bill & Melinda Gates Foundation*, accessed January 20, 2017, <http://www.gatesfoundation.org/What-We-Do/Global-Development/Polio>.

⁹² Nicole Kappatos, “Birthday Balls,” *Richmond Times-Dispatch*, January 31, 2016, accessed January 20, 2017, http://www.richmond.com/from-the-archives/birthday-balls/article_094f319a-ada6-11e5-8a47-6fe2f1c7dae9.html.

⁹³ Ogintz.

- Considering the knowledge and technology available in colonial Boston, which side won in your class?
- Would the reasoning used during the debate apply to a debate about vaccination today? Why or why not? If not, how would it be different today, and what does that tell you about how approaches to medical issues change over time?

Personal Motivations

All three of the diseases discussed in this chapter have been wholly or almost wholly eradicated in the US. Smallpox has been eradicated globally and polio has been almost entirely eradicated worldwide, too. It is challenging to understand how deeply people feared these diseases in the US, or why they might risk subjecting their children to vaccine trials on a large scale. To develop a more complete—and personal— understanding of these issues, do one of the following:

- Interview someone who was vaccinated for polio during the 1950s. In particular, find someone who remembers the advent of the Salk vaccine, if possible. Ask them if their parents prohibited them from certain activities before the vaccine, whether they were scared of polio, and how they felt when news of the vaccine broke.
- Research newspaper articles from April and May of 1954 through 1955—the period between the beginning of the large-scale Salk vaccine trials and Dr. Francis’s announcement. Look for articles that interviewed individuals or explained how people felt about the possibility of a safe, effective vaccine. Note what they said about their previous attempts to avoid polio, fears of it, and feelings about the trials and vaccine.

Discuss your findings with your classmates. Do they change your understanding of the history of the polio vaccine and lay involvement in the trials? Do you think that people feel the same way about vaccinations today? Why or why not?

ABOUT THE AUTHOR

M. Girard Dorsey is an associate professor of History and a core faculty member in the Justice Studies Program at the University of New Hampshire. She earned a BA from Stanford, where she majored in History and Human Biology. She later earned a JD from Harvard, and a PhD in History from Yale. One of her areas of interest in teaching and research is the history of medicine in the United States. She gives public talks on the Spanish influenza and is working on a project that includes a study of the integration of nurses and physicians into the modern American military.

Chapter 84

IMMUNIZATION: RIGHTS, RESPONSIBILITIES, REGULATIONS, AND RESULTS

Alan R. Hinman, MD, MPH

Center for Vaccine Equity
Task Force for Global Health

INTRODUCTION

The practice of immunizing against infectious diseases is steeped in history and has been shown to be a very effective means by which to promote health, yet many parents still refuse to vaccinate their children against life-threatening diseases. Dr. Hinman's lecture explores the tension that exists between this very cost-effective means of keeping populations healthy and the perception that this public health approach trumps one's personal freedom. This chapter highlights the key aspects of the role of human rights, vaccine regulation, responsibility of the public health and healthcare systems, and their integration. Dr. Hinman focuses on several significant examples—including measles and the human papillomavirus—to emphasize the roles that the media, personal-belief exemptions, and cultural norms play in our inability to eliminate or eradicate vaccine-preventable diseases. This chapter also presents a comprehensive overview of the importance of vaccination in our everyday lives and the tremendous efforts to assure the efficacy and safety of this cost-effective public health measure—one of the greatest public health achievements to date.

LECTURE

Historical Background

Immunization is one of the most effective and cost-effective measures we have to protect health and prevent disease. We've saved millions of lives around the world through immunizations. Nonetheless, immunizations have been controversial ever since Englishman

Edward Jenner first transferred pus from a cowpox blister on the hand of the milkmaid, Sarah Nelms, into the arm of 12-year-old James Phipps in 1796. Two months later, Jenner inoculated James Phipps with pus from a smallpox victim and found that James did not develop smallpox himself. Jenner named the procedure “vaccination” after *vaccinia*, the Latin for cowpox. Such a study would never be allowed today. Informed consent? This was before the germ theory of disease.

In the centuries before Jenner's experiments, smallpox had been a major killer of kings and peasants alike, with millions of deaths over the years. The introduction of smallpox and measles into the Americas in the wake of the Spanish colonization decimated the indigenous populations of North, Middle, and South America.

Since the fifteenth century, practitioners in Asia and the Middle East had practiced something called variolation. This involved taking small amounts of pus from smallpox lesions—smallpox was then called *variola*—and inoculating that into the skin of individuals. The inoculated then developed a mild form of smallpox from which they recovered, and were subsequently immune.

Unfortunately, 1% to 2% of those who were variolated died as a result of the procedure. However, although this was a pretty high adverse event rate, it was much lower than the 30% death rate from naturally acquired smallpox. Clearly, the benefits of variolation outweighed the risks, and it was a fairly widespread practice. It was introduced to the Americas, and in the 1700s Cotton Mather was a practitioner of variolation.¹

So, Jenner's experiment gave the world a new and safer approach with which to prevent smallpox. But, it immediately attracted critics. Some claimed that inoculating cowpox into humans might turn them, or parts of them, into cows. Some objections were based on religious belief; others came simply from the fear of inoculating animal tissues into humans.

One result was that anti-vaccination societies developed. Anti-vaccination leagues were formed in England in the mid-nineteenth century, and in the US, at least as early as 1879. In addition, there were anti-vaccination demonstrations, and even riots, when compulsory vaccination laws were enacted in England in the mid- nineteenth century.

Rights

Human rights are a set of beliefs about the societal basis for human well-being. They represent a series of non-provable statements about what people need to maintain their human dignity, and they primarily describe the relationships between individuals and society, usually in the form of the state (as in government).

Human rights are rights of individuals, inherent to individuals just because they're human. They don't have to be earned; they don't have to be purchased. You have them simply because you are a human being. Human rights apply to all people around the world.

Global codification of human rights in formal documents really began in the wake of World War II and the Holocaust. Several human-rights documents have been developed and enacted. There are actually dozens, but three represent the primary legal basis for human rights: the Universal Declaration of Human Rights (UDHR), issued in 1948; the International

¹ Cotton Mather was a famous clergyman in colonial Boston. His influence spread beyond the religious realm into issues that had an impact on the wider society. See chapter 4 for more details.

Covenant on Economic, Social and Cultural Rights (ICESCR), created in 1966; and the International Covenant on Civil and Political Rights (ICCPR), created in 1966.

I'm going to quote a few of the important statements from these documents that have a bearing on immunization. Article 1 of the Universal Declaration of Human Rights says, "All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood."²

Article 2 of UDHR says that, "Everyone is entitled to all the rights and freedoms set forth in this Declaration without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status."³ This, remember, was written in 1966, and the issue of sexual orientation was not then being discussed in society. If this was written today, it would probably contain a statement about sexual orientation.

These two articles outline the major parameters of human rights. Article 25 of UDHR addresses the right to health: "Everyone has the right to a standard of living adequate for the health...of himself and of his family."⁴ Health is not necessarily inherent, but may be something that requires a standard of living and some ability to purchase or obtain things. This sentence is also interesting because it says, "himself and of his family." Remember, this is post-World War II, and these things were mainly written by men. Again, were it written today, it would probably have a different orientation. However, it is worth noting that one of the prime movers behind the development of the Universal Declaration was a powerful and famous woman—Eleanor Roosevelt.

There are further statements on the right to health. In the International Covenant on Economic, Social and Cultural Rights, Article 12 describes, "the right of everyone to the enjoyment of the highest attainable standard of physical and mental health." It also says that, "The steps to be taken by the states parties to the...Covenant" include those necessary "for the provision for the reduction of the stillbirth-rate and of infant mortality... [t]he improvement of all aspects of environmental and industrial hygiene... the prevention, treatment and control of epidemic, endemic, occupational and other diseases... [and t]he creation of conditions which would assure... medical service."⁵ There is a further elaboration specifically regarding immunization in a general comment to the treaty.

The treaties, these covenants, are formal legal documents. They're usually not long, but they do inspire the question: What does that mean? There are international committees established around each of these human rights documents, which try to elaborate on what they really mean. The committees draft "general comments."

For example, general comment 14 on the ICESCR describes the core obligation of governments to provide immunization against the major infectious diseases occurring in the community.⁶ In other words, we have a human right to be immunized.

⁶ Office of the High Commissioner for Human Rights, "CESCR General Comment No. 14: The Right to the Highest Attainable Standard of Health (Art. 12), accessed March 28, 2017, <http://www.refworld.org/pdfid/4538838d0.pdf>.

These documents describe the rights of individuals to make choices, and the obligation of states to respect, protect, and fulfill those rights. “Respect,” in this situation, means that the states must allow individuals to exercise their rights; they must not impede the exercise of their rights. “Protect” means that states must not allow others to infringe upon the exercise of these rights. “Fulfill” represents an obligation on the state to provide conditions in which the rights can be exercised. These statements of rights, statements of responsibilities of states or governments, are pretty broad.

Are there any circumstances in which the exercise of human rights can be limited? Well, yes, there are. Article 29 of the Universal Declaration says that, “In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.”⁷

This phrase, “just requirements of public order and the general welfare,” is the basis by which the state—the nation—commonly acting through state departments of health in the US, can infringe upon the exercise of rights by isolating or quarantining individuals, compelling treatment of communicable diseases, etc.

In 1984, there was a meeting of 31 experts in Siracusa, Sicily, to consider further the issue of how you can limit the exercise of the rights guaranteed through the International Covenant on Civil and Political Rights (ICCPR). The participants agreed on the need for a close examination of the conditions for permissible limitations and derogations. They went on to enunciate that a restriction of rights guaranteed under the ICCPR is allowable if the restriction is provided for and carried out in accordance with the law, and it is in the interest of a legitimate objective of general interest such as public safety, public order, and public health.

The participants also stated that this kind of restriction is strictly necessary in a democratic society in order to achieve the objective, *if* there are no less intrusive and restrictive means available to reach the same goal, *and* the restriction is based on scientific evidence and is not imposed arbitrarily. These principles are, in fact, being put into place.

For example, in New York City in the 1990s, there was a resurgence of tuberculosis (TB) with multi-drug resistant tuberculosis occurring primarily in HIV-infected individuals, many of whom were addicted to drugs. Many were homeless, and many didn’t want to take treatment. So, the question arose: Is it legal and ethical and respectful of human rights to do nothing?

Essentially, the system that developed was this: Step one, you say, “OK, you need to take these drugs for the next 12 or 18 months [in the case of multi-drug resistant TB]. Yes, some of them are going to make you feel sick, but you need to take them. You need to take them throughout the whole period.” What’s the likelihood that somebody is going to do that? Even if that someone is an affluent, middle class, fully employed individual? Not great.

Step two, you try to establish a contract with the person. They will say, “OK, I will sign my name here that I’m going to do this.” Once again, the likelihood of success is not too high.

Step three, you use Directly Observed Therapy (DOT). An individual—typically a representative of the health department, but sometimes a family member—physically watches the patient take the drugs every day. DOT has been the strategy that has enabled us, around

⁷ Declaration of Human Rights.

the world, to bring some degree of control over tuberculosis. It's used in affluent and impoverished areas alike, and it works most of the time. But, if you can't find a person to administer the therapy, then even DOT doesn't work.

Step four, you may have to confine the individual. This is, in essence, the last step and the process of getting to it represents the whole roster of principles laid out in the Siracusa principles: to take the least restrictive measure possible to achieve the legitimate goal.

Responsibilities

We all have rights. Those rights can be restricted under certain circumstances to protect the public's health. What are society's responsibilities as opposed to our own personal responsibilities? Let's consider the ethical basis on which public health rests. This is often considered to be utilitarianism, a philosophical belief that prioritizes achieving the greatest good for the greatest number. It's achieving an ecstasy index, if you will. Its approach is basically democratic, but it will always value utility over justice, and it can be heartless—it could result in decisions being made solely on the basis of cost-benefit or cost-effectiveness reasoning. In many ways, this would be antithetical to public health's concern for the most vulnerable and underserved and for the achievement of social justice.

Utilitarianism is probably not the right theory to use for the ethical basis for public health. I think public health is based more on a communitarian ideal in which we balance individual rights and interests with those of the community as a whole. This considers that individuals are shaped by the cultures and values of their communities. The community may be a family unit, but is usually understood in the wider sense of interactions between a community of people in a geographical location or people who have a shared history or shared interest.

I used to serve on the Task Force on Community Preventive Services that assessed the evidence base for what we do in public health. The Task Force defined communities as groups of people who share a common characteristic. Characteristics may be geographic, cultural, sexual orientation, country of origin, whatever.

Communities tend to be groups of people who share customs, institutions, and values. In pursuit of the common good, individuals and communities are usually willing to yield some aspects of their individuality. This might be reflected, for example, in restrictions on smoking areas where smokers willingly—mostly willingly—forgo smoking in certain areas in order to protect the health of the community. Public health is fundamentally an effort to promote the common good and the shared values of reducing disease, saving lives, and promoting good health while minimizing restrictions on human rights.

Another manifestation of communitarianism is in the immunization arena. With the exception of tetanus, all of the diseases we try to prevent using vaccines are transmitted from person to person. That means that a decision about immunization is not strictly an individual decision; it affects the community. If I decide not to immunize my child, for whatever reason, and my child becomes ill with measles, she may transmit the disease to other children who may be especially vulnerable as a result of, for example, undergoing chemotherapy for leukemia; or to other children too young to be vaccinated; or even to other children who have been vaccinated but are not protected—vaccines are not perfect.

For example, three to five percent of people who receive the measles vaccine won't be protected. This is not an abstract example. Measles is no longer an indigenous disease in the

US. Since 1999, all cases of measles that have occurred in the US have originated in another country. Recently, many cases have occurred in persons who consciously have not been vaccinated. They have traveled to another country, become infected there, and brought the disease back to the US.

In 2008, a seven-year-old unvaccinated boy in San Diego who had recently been with his family in Switzerland was diagnosed with measles. He was responsible for a total of 11 additional measles cases in unvaccinated infants and children aged 10 months to 9 years. These 11 cases included both of the boy's siblings, five children in his school, and four additional children who had been in the pediatrician's office at the same time as the boy—transmission was occurring in a healthcare facility!

Among the four patients who had been in the pediatrician's office, three were infants less than 12 months of age and therefore too young to have been vaccinated. Also, they were so young that they were at greater risk of experiencing complications. One of the three was hospitalized for a couple of days and another traveled by airplane to Hawaii, while infectious, potentially exposing others. Fortunately, I don't think there were any tertiary cases.

Among the other nine patients—all of whom were old enough to have been vaccinated—eight were unvaccinated because of parental beliefs. There were approximately 70 children exposed to the disease in the school, day-care center, pediatrician's office, and other community settings who were unvaccinated and exposed because their parents either declined measles vaccination, or they were too young to be vaccinated—these 70 were placed under voluntary home quarantine.

The San Diego outbreak illustrates the risk for measles transmission in healthcare settings. Airborne transmission of measles has been reported in emergency departments, physicians' offices, and pediatric ambulatory care settings. I believe some of the measles cases that occurred in New York City in 2014 resulted from transmission in healthcare settings.

Individuals have a responsibility to the community. If I do not vaccinate my child, I endanger my community. I'm proud to be a member of Voices for Vaccines, a parent-led group providing science-based advocacy for vaccines. Our motto is, "Pro-child, pro-community, pro-vaccine."

Regulations

There are two kinds of regulations that I wish to talk about: regulations about the vaccines themselves and regulations about the use of vaccines.

Modern vaccines are safe and effective. However, they are neither perfectly safe nor perfectly effective. That means that some persons who receive vaccines will have adverse effects, and some persons who receive vaccines will not be protected.

Regulations about vaccine composition, safety, and efficacy antedate the Pure Drug and Food Act of 1906, which has a role of overseeing vaccines. Vaccines are among the most highly regulated of any products in the US. For example, the manufacturing process and the manufacturing plant are separately regulated, so that each lot of vaccine is separately inspected before being released.

Vaccine developers go through a multi-step process to obtain licensure of vaccines. After initial laboratory investigation indicates the possibility that an entity might be useful as a

vaccine, it is tested in animals to determine whether it induces protection and whether it causes adverse reactions.

Next, if deemed potentially suitable, vaccine developers submit a plan for testing in humans under an Investigational New Drug (IND) permit. This testing has three phases.

Phase one entails administration of the vaccine to a limited number of humans—typically dozens—to determine whether the vaccine induces an immune response and whether it causes immediate apparent adverse effects.

Phase two typically involves up to a few hundred individuals to determine appropriate dosing and, again, to look at potential adverse events.

Phase three typically involves several thousand individuals to determine the immune response, adverse events, and natural protection against disease of the potential vaccine.

Recent trials of rotavirus vaccine involved some 50,000 to 60,000 infants before the vaccine was licensed for release and use in the US. This large test number was used because the original rotavirus vaccine, introduced in the 1990s, was found to be associated with an additional risk of intussusception—an intestinal blockage—that occurred at an excess rate of about one in 10,000 of those vaccinated. Think about finding an excess risk of one in 10,000. Obviously, you have to have at least 10,000 in the study population.

After phase three testing, the developers submit a Biologics License Application (BLA) to the Food and Drug Administration (FDA) that, if approved, enables them to produce and distribute the vaccine. The Biologics License Application is reviewed by an independent committee, the Vaccines and Related Biological Products Advisory Committee, or VRBPAC. This body recommends to the administrator of FDA whether or not to license the product for use in defined populations for defined purposes.

Following licensure, the Advisory Committee on Immunization Practices (ACIP) reviews the evidence about safety and efficacy and then issues recommendations about how the vaccine should be used. The ACIP is an independent committee comprising 15 authorities who are knowledgeable in the fields of immunization practices and public health, who have expertise in the use of vaccines and other immunobiological agents in clinical practice or preventive medicine, and have expertise with clinical laboratory vaccine research or in the assessment of vaccine efficacy and safety.

The ACIP also includes a person or persons knowledgeable about consumer perspectives and/or social and community aspects of immunization programs. In addition to these 15 individual members—none of whom is a government employee—the ACIP includes liaison representation from the American Academy of Pediatrics, the American Academy of Family Physicians, the American Academy of Physicians—which is the internal medicine group—the American College of Obstetrics and Gynecology, the American Medical Association, and many other organizations.

ACIP recommendations are proposed to the director of the Centers for Disease Control and Prevention (CDC) and the Assistant Secretary of Health in the Department of Health and Human Services. Once accepted, they are widely published and endorsed by all of the aforementioned organizations. These are truly national recommendations that are harmonized among the various medical specialty organizations. They become a standard of practice for healthcare practitioners and typically are included as covered services by health-insurance organizations.

The ACIP has a unique power under the Vaccines for Children Act of 1993 to declare that vaccines recommended for universal application to children under the age of 18 must be

provided as an entitlement, free of charge, to children who are on Medicaid, uninsured, or are under-insured for one or more vaccines, are American Indians, or Alaska natives. This action removes financial barriers to access to vaccines for those who are less well-off, and has resulted in a dramatic reduction in disparities and immunization coverage among population groups in the US. Nearly half of all US children are entitled to free vaccines through the Vaccines for Children Program, a program that currently costs about \$3 billion annually. It is an extraordinary investment with extraordinary returns.

Our challenge is to maximize effectiveness while minimizing adverse consequences. To deal with the fact that vaccines aren't perfectly safe, the National Childhood Vaccine Injury Act of 1986 created the National Vaccine Injury Compensation Program. This is a no-fault alternative to using the traditional court system for resolving vaccine injury claims and provides compensation to people found to be injured by certain vaccines.

As of February 3, 2014, 3,511 compensation awards had been made since the first claims were filed in 1989. More than \$2.7 billion in compensation awards had been paid with more than \$100 million paid to cover attorney fees and legal costs. In addition to these 3,500 awards, more than 9,700 claims had been dismissed as not reflecting vaccine causation.

This program has resulted in a stabilization of the supply of childhood vaccines in the US. At the time the Act was passed in the 1980s, several manufacturers had left the market, or were threatening to do so, because of a growing number of lawsuits filed against them alleging that the vaccines had improperly caused injury. Regulations ensure that our vaccines are as safe and effective as possible, *and* provide a mechanism for compensating those who are injured by vaccines.

Compulsory Vaccination Regulations

What about regulations that *require* some people be vaccinated? Immunization mandates have a long history, starting with requirements that the entire population be vaccinated against smallpox. In England, the Vaccination Act of 1855 ordered mandatory vaccination of infants, and in 1867, this was extended to 14-year-olds. These Acts prompted the formation of anti-vaccination leagues, journals, demonstrations, and even riots.

In 1902, during an epidemic of smallpox in Boston and surrounding areas, the Cambridge Board of Health in Massachusetts passed a regulation requiring all citizens who had not been vaccinated in the previous five years to undergo the procedure again. A minister named Henning Jacobson refused vaccination, and he also refused to pay the \$5 fine that he was levied as a result of violating the law. This initiated a series of lawsuits that ultimately reached the Supreme Court of the United States. In 1905, the Supreme Court issued its decision in *Jacobson v. Massachusetts*. Justice John Harlan wrote, in part, the liberty secured by the Constitution of the United States to every person within its jurisdiction does not import an absolute right in each person to be, at all times and in all circumstances, wholly freed from restraint. There are manifold restraints to which every person is necessarily subject for the common good. On any other basis, organized society could not exist with safety to its members. Society based on the rule that each one is a law unto himself would soon be confronted with disorder and anarchy.⁸

⁸ *Jacobson v. Massachusetts*, 197 U.S. 11 (1905). See previous chapter for more details about this case.

The Supreme Court's decision has been reaffirmed since, and in many ways, is the basis for many of the police powers that health departments have today.

An approach that has been taken in the US—more than in other countries—has been for states to require that children be immunized before entering school. This approach began in the mid-nineteenth century as public schooling began to be obligatory, resulting in smallpox outbreaks amongst school children. The first statewide school immunization requirement was enacted in Massachusetts in 1850.

By the turn of the twentieth century, nearly half of all states had such requirements, although we don't know how strongly they were enforced. In 1977, there was a Childhood Immunization Initiative, in which I was heavily involved, that incorporated a request from the Secretary of what is now the Department of Health and Human Services, Joe Califano, to every governor in the US, asking them to enact and enforce school immunization requirements.

As of 1980, all 50 states have laws requiring that all children be immunized before entering school. Remember, this is not a national mandate; these are state laws. The specific requirements under which vaccines are necessary vary from state to state, as do the allowances for exemptions to the law based on medical condition, religious belief, and personal or philosophical beliefs. (The last are often called PBEs, Personal Belief Exemptions).

What has been the effect of these regulations? Measles transmission in schools was common in the era before interruption of endemic disease transmission. School requirements for vaccination have been a successful strategy for achieving high vaccination coverage in school kids and decreasing transmission in school settings.

However, while all states do require children to be vaccinated before entering school, all states also offer medical exemptions to immunization requirements for day care and school attendance. If, for example, a child has hypersensitivity to one of the components in a vaccine, or is immunocompromised and therefore should not get a live virus vaccine, he may be exempt on a medical basis. In addition, as of 2014, all states, except Arkansas and West Virginia, allow religious exemptions, although the question of how one defines a religious belief varies from state to state.

Twenty-one states, including California, offer non-medical personal belief exemptions.⁹ These exemptions are defined differently in each state. Some states require that a parent obtain a notarized statement that he or she has philosophical beliefs that preclude immunizations. Others may have a simple check-off box on a form that says parents have personal beliefs that preclude immunization.

Studies have shown that the easier it is to get an exemption, the higher the exemption rate, and the greater the risk of vaccine-preventable diseases. Some parents reportedly check the exemption box, not out of opposition to immunization, but to avoid the hassle of having to go find the immunization record and produce it.

The personal belief exemption allowed in California requires only a parental affidavit. If you compare people who are exempted from vaccination because of personal beliefs with those who are vaccinated, those who have exemptions are between 22 and 224 times more

⁹ California does not allow non-medical exemptions as of 2016 and other states have different options now, too. There is a map and chart with updates at "States with Religious and Philosophical Exemptions from Immunization Requirements," National Conference of State Legislatures, August 23, 2016, accessed April 9, 2017, <http://www.ncsl.org/research/health/school-immunization-exemption-state-laws.aspx>.

likely to contract measles. Some of us have said—including in print—that it should not be easier to get an exemption than it is to get your child vaccinated. However, in California that is the case: all you have to do is say “Don’t want it.”

School immunization requirements were originally enacted to prevent outbreaks of disease, such as measles, that occur among school children, and they were highly effective. But, because they were so effective, they began to be viewed as a convenient way to rapidly ensure high levels of protection among children for diseases that were not necessarily epidemic in schools, but for which the vaccines had recently become available.

I believe this began with the ACIP recommendation for universal application of the hepatitis B vaccine in 1991. In the US, hepatitis B is primarily transmitted by sharing needles or through sexual contact. Many parents felt that their children were not at risk of such behaviors. They thought, “My child is never going to have sex. My child is never going to shoot up.” In addition, these are not behaviors that are acceptable at schools. Nonetheless, most states established requirements for hepatitis B vaccination before school entry. Many parents oppose this for the very reasons that I gave: “This isn’t something that’s transmitted in school and my child is not risk.” This opposition has carried forward to newer vaccines, such as the varicella (chickenpox) vaccine, and human papillomavirus (HPV) vaccine.

However, chickenpox should not be compared to hepatitis B. Chickenpox is a disease that is often transmitted in school settings. In fact, the primary mode of transmission of chickenpox in the past was school-based outbreaks. It’s usually a mild disease, but it can result in complications like pneumonia or encephalitis. Before the varicella vaccine was introduced, there were about 100 deaths per year from chickenpox in the US. Still, the disease was often viewed just as a part of growing up.

However, a child who has chickenpox has to stay home from school for 5 to 10 days, which means that a parent has to stay home also for 5 to 10 days to take care of them. If there’s more than one child in the house with the infection, you have another week. In fact, cost-effectiveness studies have shown that varicella vaccination can be justified on the basis of lost parental earnings, not just on the basis of illness prevented.

Human papillomavirus (HPV) is a somewhat different story. HPV is the main cause of cervical cancer, and causes other cancers and genital warts in both men and women. It is spread through sexual contact, including non-penetrating sexual contact, and it is acquired by most people soon after initiating sexual activity.

The development and licensure of HPV vaccines containing several serotypes of HPV, of which there are about 100, provided a major opportunity to prevent a substantial proportion of the 3,700 cervical cancer deaths a year that still occur in the US, despite a quite effective program of Pap smear screening and treatment. In many developing countries, cervical cancer is the leading cause of cancer deaths in women, and often there’s no infrastructure to do Pap screening.

HPV vaccines provide a major mechanism to prevent needless death. They represent the second cancer vaccine we have. Hepatitis B vaccine was the first cancer vaccine—to prevent liver cancer—and now we have HPV to prevent cervical cancer. In spite of the fact that this offers a great opportunity, introduction of HPV vaccines elicited a major negative response on the part of some parents in the United States who claimed it would result in promiscuous sexual behavior. However, studies have actually shown that girls who receive the HPV vaccine are more likely to postpone intercourse to a later age than girls who don’t receive it.

To compound the problem in the US, a vaccine manufacturer provided financial support to groups who lobbied state legislatures to enact laws requiring HPV vaccine as a condition of middle or high school attendance. This provoked a significant backlash that has still not been overcome in this country. Our performance with HPV vaccine in the US is not as good as Rwanda, for example, which has reached 90% coverage in 10- to 12-year-old girls. In the US, coverage is about 50 to 60%.

RESULTS

Now that we've covered rights, responsibilities, and regulations. Let's talk about results. Before turning to specifically immunization, I'd like to consider some of the results relating to general progress in health. I like to think about the health progress that's been made in what I consider to be living memory—the period dating from the birth of my father up to the present.

My father was born in 1904. At that time, the median life expectancy of a white male at birth was 46.6 years. I was born in 1937. When I was born, the median life expectancy was 59.3 years. We'd gone up by nearly 13 years.

My older daughter was born in 1970. At that time, the median life expectancy was 68.0 years, more than a 20-year increase in life expectancy in the 66-year period since my father was born. The median life expectancy of a white male born in 2009 is 76.4 years. This represents an increase in median life expectancy at birth of nearly 30 years in just 100 years. To look at it another way, for every week of the twentieth century, median life expectancy at birth increased by two days. That is an incredible achievement.

The increase in life expectancy is primarily a result of prevention, rather than treatment. It is mostly a result of reductions in infant and young child mortality, primarily with regard to reductions in infectious diseases. As Ben Franklin is said to have pronounced, "An ounce of prevention is worth a pound of cure." (An ounce is 6.6% of one pound so, by Franklin's reckoning, we should be investing approximately 6.6% of all health expenditures in prevention. We actually invest about 1%).

Improvements in sanitation, nutrition, and immunizations have been the driving factors in the increase of life expectancy. Immunization has been one of the most spectacular lifesaving measures known to humankind. Thanks to immunization, smallpox, which killed millions every year, has been eradicated from the face of the earth, and exists only in laboratory conditions.

In the past century, there has been an explosion in the number of vaccines available in the past century. When my father was born, the only vaccine administered to infants was smallpox. The same was true when I was born. By the time my daughter was born, there were eight different antigens, and for the child born in 2009, there are 16 different diseases that can be prevented with immunization. As a result, our immunization schedule is really complicated. Children may get as many as five injections at a single visit, and we only have four arms and legs—one reason why there is so much interest in making combination vaccines!

Today, we have opportunities that we have never had before to prevent illness and death. In the US, we've seen dramatic reductions in the occurrence of diseases that are now preventable by vaccination.

Declines of more than 90% have been achieved for almost all of these diseases. The exception to this is whooping cough (pertussis), which is now being seen in levels higher than those of 20 years ago; this is partly because we now recognize that whooping cough is a serious problem in adults, as well as children; also because we now have much more sensitive diagnostic techniques; and also partly because the acellular pertussis vaccine we now use apparently does not give as long-lasting immunity as did the whole-cell vaccine we used to use, but the whole-cell vaccine caused more reactions.

Even vaccines that have been recently introduced, such as pneumococcal conjugate vaccine, have resulted in major declines in the incidence of diseases. The pneumococcal conjugate vaccine is particularly interesting. It is given to infants to prevent pneumococcal pneumonia, meningitis, and other systemic infections. Administration of this vaccine to infants has resulted in dramatic declines in incidence among those under five. It has also resulted in a 50% decline in the incidence of invasive pneumococcal disease in people of all ages, including those who are certainly not targets for vaccination. In fact, in terms of numerical value, the number of cases prevented by pneumococcal conjugate vaccine is greater among adults than it is among the children who received the vaccine. This apparently is a result of the fact that vaccinated infants are not infecting their grandparents.

Immunization levels in the US are at an all-time high. They are at, or above, 90% for nearly all the vaccines that have been recommended for several years. (HPV is not on that list.) Reflecting the enactment and enforcement of school immunization requirements, immunization levels in children entering school are at about 95%.

Thus, it can be said that we've had spectacular success in the US, and the same is true globally. Global immunization levels rose rapidly in the 1980s although they have risen much more gradually since 1990. Nonetheless, as of 2012, 83% of one-year-old children around the world have received at least three doses of DTP vaccine to protect against diphtheria, tetanus, and whooping cough. There do, however, remain marked disparities in immunization coverage in different regions of the world.

We've seen major declines in deaths from vaccine-preventable diseases around the world just in the last 10 years. In 2000, it was estimated that there were approximately 2.7 million child deaths due to vaccine-preventable diseases. By 2008, this number had decreased by 45%. This is an impressive achievement. But, to put it into perspective, the 1.5 million deaths from vaccine-preventable diseases in children in 2008 is approximately 4,110 deaths each day, or 171 deaths every hour, or one vaccine-preventable death every 21 seconds. We still have a lot to do.

Before the measles vaccine was developed in the 1960s, it was estimated that there were between 5 and 8 million deaths every year due to measles. It was such a common and severe problem that in some African countries children were not given names until they'd survived measles—the names were handed down from generation to generation, and you didn't want to waste a name on a child who wasn't going to survive. By 1980—more than 15 years after measles vaccine had been introduced globally—the number of deaths from measles had been reduced by only about 50%. But, as a result of the widespread application of the measles vaccine, which really began in the late 1970s, the estimated annual death toll from measles fell by nearly 80% from 1980 to 2000. Between 2000 and 2012, there was a further 75%

reduction, down to 122,000 deaths. To go from 5 to 8 million to 122,000 is a remarkable achievement, but it's still 122,000 deaths too many, because virtually all of these deaths are preventable if we can only get the vaccine to the children.

New vaccines are being developed that give hope that we may be able to bring diseases such as AIDS, tuberculosis, and malaria under control, but we're having problems with each of these because they're very complex immunologically. Smallpox has been eradicated. We are close to eradication of poliomyelitis. As of 2014, there are only three countries in the world that have never interrupted transmission of polio: Afghanistan, Nigeria, and Pakistan. Afghanistan's polio currently is all coming from Pakistan.

Many of us believe that measles eradication is inevitable, and just to demonstrate that, an article was published nearly 32 years ago entitled "The Case for Global Eradication of Measles."¹⁰ Eradication is for everyone, everywhere, and forever. Eradication represents the ultimate in equity.

CONCLUSION

The use of vaccines involves a consideration of the interplay of rights, responsibilities, and regulations. We have a continuing need to balance the tensions between individual rights and the meeting of "just requirements of public order and the general welfare."¹¹ We yield some degree of personal freedom, in order to protect the community.

Vaccines are not perfect. They are neither perfectly safe nor perfectly effective, but there exists an extensive regulatory process to ensure they're as safe and effective as possible. Vaccines have made critical contributions to improvements in human health over the past 218 years. There's every indication that they'll make even more contributions in the years to come as we develop new vaccines for infectious diseases, as well as vaccines to prevent non-communicable diseases and therapeutic vaccines. For me, the message is very clear: "Disease is bad. Vaccines are good."

DISCUSSION QUESTIONS FROM THE AUDIENCE

Question #1: What are your thoughts about mandating the flu shot for healthcare workers?

Response: That's a very interesting question. We have, for decades, recommended that healthcare workers get annual influenza immunization to protect themselves and their patients. An infected healthcare worker can infect someone who is on immunosuppressive therapy and has a high risk of complications or death. In spite of these annual recommendations and a great deal of effort trying to improve immunization levels in

¹⁰ Donald R. Hopkins, Jeffrey P. Koplan, Alan R. Hinman, and J. Michael Lane, "The Case for Global Eradication of Measles," *The Lancet*, 319, 8286 (June 19, 1982): 1396–1398, accessed January 27, 2017, [http://www.thelancet.com/journals/lancet/article/PIIS0140-6736\(82\)92510-7/abstract](http://www.thelancet.com/journals/lancet/article/PIIS0140-6736(82)92510-7/abstract).

¹¹ Declaration of Human Rights.

healthcare workers, we rarely get above about 60%. If we go so far as to send immunization carts onto the ward, go to different shifts, you name it, then we get up to 70%.

Implementing a requirement of annual influenza immunization results in spectacular increases in immunization coverage. I think Virginia Mason Hospital was the first to implement such a requirement, and they went from about 65 or 70% to about 98%. I don't think they fired anyone. People either got vaccinated or left, but I don't think anyone was actually discharged.

The approach of "OK, if you have an objection, we're going to put a scarlet A on you—like in *The Scarlet Letter*—and make you wear a mask and stay away, may, in principle, have some advantages...¹² There is no question that the healthcare worker who gets infected is a potential source of danger to patients. Healthcare workers like to tough it out. They think, "It's just the flu. I'm going to go to work." If you happen to be working in a cancer ward, that might not be a good thing—it can be an infringement of some rights to behave this way. I think this situation and Virginia Mason Hospital's approach to it meets the Siracusa principles. It is necessary, I think, to protect public welfare and the public's health. It would be lovely if we didn't have to enforce vaccination, but it works wherever it's been done.

Question #2: What about school immunization requirements?

Response: The University of New Hampshire (and others) requires students to be vaccinated with MMR before allowing them to attend classes. For workers in New Hampshire healthcare institutions hepatitis B vaccine is required. We are at an odd point with respect to immunization mandates, though. There is increasing opposition. People who are called "vaccine hesitant," "vaccine resistant," or sometimes "anti-vaxxers," exist in clusters in the American population, and are often quite vocal.

In 2014, *JAMA: the Journal of the American Medical Association* published a research letter by Saad Omer, myself, and a couple of others.¹³ After a review of attempts to modify school immunization requirements in several states over the last several years, we had found that none of the efforts to expand exemptions had passed, whereas a substantial proportion of the efforts to make exemptions harder to get did pass.

In spite of the public debate and the publicity, there still seems to be substantial support for the notion that our kids should be safe in school, at least with respect to infectious diseases. I think it's entirely plausible that the influenza vaccine may join the mandatory vaccination group in the future. There are some logistic issues with the influenza vaccine because it is an annual immunization, and so there would be a lot more record keeping involved.

At present, since the required vaccination schedule is based upon school age, and all you have to do is check the year the child enters day care or kindergarten to see which vaccinations a child should have by a certain point. Registries can provide the information that makes an annual determination of immunization status simple. Immunization registries are becoming more and more common in the US. Currently, between 85 and 90% of all

¹² In Nathaniel Hawthorne's novel, *The Scarlet Letter*, set in colonial America, a woman who violated social norms by becoming pregnant out-of-wedlock had to wear a scarlet "A," for adulteress, on her bodice as a punishment.

¹³ Saad B. Omer, *et al.*, "Legislative Challenges to School Immunization, 2009-2012," *JAMA* 311, no. 6(2014):620-621.

children less than six-years-old in the US have at least two immunizations recorded in an immunization information system or immunization registry. At this time, New Hampshire is the only state in the United States that doesn't currently have an immunization registry, but it is working on one.

Several years ago, we did an economic analysis of the cost and savings from the use of immunization registries and found that far and away the biggest positive factor, economically, of immunization registries would be a reduction in staff effort in pediatrician's offices, typically in August. Right now, those practices may not allow their staff to take vacation because they have to be generating so many immunization records. There would also be a reduction in the overtime paid in schools to review immunization records. The registry can do all that work automatically. In Michigan, each school says, "Here are the kids entering this year." The registry sends back messages like "These kids are OK, but these two need those vaccines."

When it comes to influenza however, the disease is not as feared as many of the other vaccine-preventable diseases, and the influenza vaccine is not as good as many of our other vaccines. Depending on the year and the match between a circulating strain and the strains in the vaccine, it may be only 50% effective, or it could be 75% or even 80% effective. But that contrasts with the 90+% effectiveness of the measles vaccine.

The issue is further complicated by the fact that so many things are called flu that aren't actually the flu. We hear people say, "I had a stomach flu last week." Yet, the influenza virus infection doesn't cause gastrointestinal symptoms. If you had diarrhea last week, it probably wasn't influenza, but you still call it flu. Then there are many things that cause symptoms similar to flu. We hear people say, "I got the flu shot, and then I got the flu." But influenza vaccine does not protect against rhinovirus infections, for example. We don't normally get diagnostic tests done to tell us what the cause of the illness is, so we may not know for sure in any particular case—it may be influenza, but it may just as likely not be.

Thus, I would conclude that the influenza vaccine is a little harder to consider mandating than, for example, the measles vaccine. But it may happen.

Question #3: What happens to influenza vaccine that is not used in the US?

Response: For physicians' offices that don't do a lot of immunization, it may be much more convenient to have the patient go to the pharmacy and get immunized. They are important partners of some interest, compared to in the early 2000s.

At the end of a recent flu season, Walgreens Pharmacy discovered that they had 350,000 doses of influenza vaccine that they couldn't use. They were going to throw it away, but didn't want to. They called the Centers for Disease Control and Prevention (CDC) and said, "We really don't want to throw this out—it's perfectly good vaccine—but we're not going to be able to use it. Can you find a use for it?"

Very soon, 350,000 doses of influenza vaccine were on their way to Laos where they were administered to pregnant women and healthcare workers and other high-risk individuals. Everybody liked that. Indeed, they liked it so much that the following year, the effort was repeated and extended to include Nicaragua for use in pregnant women and healthcare workers.

The Bill and Melinda Gates Foundation got interested in providing some funding to us and the CDC to try to expand this effort into something called Partnership for Influenza

Vaccine Introduction. I hope, by now, that 763,000 doses of influenza vaccine have finally been unpacked in Vientiane, Laos. They were shipped from Frankfurt a few days ago [in 2014] in refrigerated containers by plane to Bangkok and then over land in refrigerated trucks from Bangkok to Vientiane. The last trucks were being unloaded earlier today, so I hope it's all there.

We hope to be able to expand this activity in the future in a somewhat different way; because this program started on the basis of goodwill and excess vaccine, it's not easy to plan around. So, now, we're trying to get advanced commitments from donors—manufacturers or other donors—for some level of support, so we can say to countries, “OK, you're going to get at least this much support to introduce influenza vaccine.” That enables those countries to establish an infrastructure for delivery and have in their mindset that they're going to be doing it. Then, later in the year, if more vaccine becomes available, they have the infrastructure to be able to absorb it. So, we're hopeful that this will expand successfully. We'll see.

Question #4: Why do some diseases require more than one dose of vaccine?

Response: It depends on the disease and how readily it spreads. For example, with polio, we have historically thought that if we had community immunity on the level of about 80% or so, it would be adequate. On the other hand, with measles—about the most highly contagious disease we know—you have to reach 95+% immunity. This is not just immunization of the population, but immunity in the population in order to interrupt transmission.

What that means is that we give two doses. One dose will protect 90% of people who receive it. The second dose will protect 90% of those who didn't respond to the first dose, because, as far as we can tell, the vaccine failures are essentially random. We can get very good levels of population immunity by using two doses of measles vaccine.

It depends on the disease.

Question #5: You spoke about the anti-vaccine sentiment here in the US and also in the UK. I was wondering if you can talk about the anti-vaccine sentiment at the global level right now.

Response: There is anti-vaccine sentiment, I think, in virtually every country in the world. The reasons for it differ from country to country. In some places, it's based on religious belief. For example, in Zimbabwe a few years ago, they had a major epidemic of measles with thousands of cases among followers of an apostolic sect that rejects vaccination.

In northern Nigeria, in 2003, political and religious leaders claimed that the oral polio vaccine was contaminated with HIV or that it contained a sterilizing agent to sterilize their children. They stopped vaccinating against polio, and it took the effort of sending the vaccine for testing in labs in Muslim countries to show that it had no HIV or contraceptive in it. Then, finally, after obtaining oral polio vaccine manufactured in Indonesia—the largest Muslim country in the world—the campaign started up again. During the year that they weren't vaccinating, Nigeria exported the disease to 23 other countries around the world that had previously been free of polio, some for as long as 10 years. That's an extraordinary setback in the campaign to eradicate the disease.

There are groups that are opposed to Western influence. In fact, in Nigeria, the leaders who were talking about HIV and contraceptives actually admitted publicly that they didn't believe that the vaccine was contaminated, but they spoke out against it because they were opposed to the polio eradication initiative because it was a Western-led initiative. That same view has been expressed in Pakistan, and to a lesser extent, in Afghanistan.

There have been some instances where, for example, the wrong diluent was used in reconstituting a vaccine. There was an instance in, I think, Guatemala a few years ago where succinylcholine, a muscle relaxant, was mistakenly used as a diluent for the measles vaccine. The children who were immunized collapsed within a half hour. Fortunately, very few died.

Understandably, such things lead to concern about vaccination and about immunization.

There are differing issues in differing countries, but I do think there is an overall growing amount of vaccine hesitancy, vaccine reluctance, vaccine refusal, anti-vaccination sentiment, whatever you wish to call it.

Question #6: What is the basis for those who oppose immunization requirements?

Response: As I say, I think the opposition to immunization requirements is based on a number of factors—religious belief, philosophical belief, libertarian beliefs captured by the sentiment: “Get your damn government fascist boots out of my door.” It's a range of things.

It is of some interest that fewer than 2%,—it may be even fewer than 1%—of children in the US have never received any dose of vaccine. A lot of the opposition to vaccines is selective, and HPV vaccine is a prime example of that currently. If you look at unvaccinated, versus under-vaccinated or partially vaccinated children, the partially vaccinated children tend to be children of higher socioeconomic status than the children who are totally unvaccinated.

Question #7: Can you speak more about the movement to reduce the exemptions for not having your child vaccinated?

Response: This is a state-by-state movement, because each of the requirements is a state requirement. Pro-vaccine parents have mobilized in many areas. Voices for Vaccines, the group that I mentioned, is very interested in this.

The anti-vaccine voices are also pretty well organized and have more years of experience in the use of the Internet and social media than pro-vaccine people do. After all, who's going to go around and protest something you like? As they say, nobody bleeds to death from prevention, so you take it for granted. The great fun in prevention is sitting around and watching nothing happen as a result of what you've done!

Question #8: Jenny McCarthy is a celebrity in the media who's opposed to vaccines because she claims that her son developed autism after getting the measles, mumps, and rubella (MMR) vaccine. Is there any truth in that?

Response: Ms. McCarthy has “mom science”—that's the term she uses—on her side. There have been at least 10, possibly more, studies that have clearly shown that the MMR vaccine is not associated with an increased risk of autism, but mere facts do not decide things.

I'm a recovering epidemiologist. I often say that data doesn't drive decisions, stories drive decisions.

Where we have failed as public-health officials and epidemiologists is in finding and using the stories that exemplified what the data show. We have to learn how to do that better. It's not just a question of providing the facts—facts don't counter beliefs. Facts can counter ignorance, but not beliefs, nor values, which are based on a variety of factors, only one of which is reason.

It's easy to understand why, if something bad happens to your child, you start asking, "What might have caused this?" As an example, about 30 years ago, there was a lot of discussion around whether DTP vaccine—diphtheria, tetanus, and pertussis—caused sudden infant death syndrome (SIDS).

Assertions were made that SIDS is precipitated by DTP. If you look into it, it turns out that the DTP vaccine is given in the US at two months, four months, and six months of age. The peak incidence of SIDS is between three and six months of age. We went through the statistics on this to find that, by chance alone, there would be 50 times a year in which a child died in the 24 hours following a DTP vaccination. It is also true that, by chance alone, there would be 50 times a year when a child had SIDS the night *before* being scheduled for DTP vaccine.

But, OK, here I am, a mealy-mouth epidemiologist talking with the mother of a child who died suddenly the night after receiving DTP vaccine. Is she going to believe me when I say, "Studies have shown that the DTP vaccine doesn't cause sudden infant death syndrome." When I'm a grieving a parent, I want to know what might have caused it, and here is an identifiable event that resulted in the child crying and having a fever. I may make an association between the vaccine and SIDS. It is impossible to deal with such circumstances, and you absolutely understand it. Even though I'm a recovering epidemiologist, if it had been my kid, I would have said, "Well, I don't know. Maybe not, but perhaps in this case." The National Vaccine Information Center—something of a misnomer—says "If it happens to you or your child, the risk is 100%," which is, in fact, a fair reflection of perception.

Question #9: What's the current situation for managing potential vaccine complications?

Response: The National Vaccine Injury Compensation Act provides coverage for side effects from vaccines that are recommended for universal use in children, even if those vaccines are administered to adults. This is a no-fault system, but it also means you cannot go to court to sue the manufacturers unless you've gone through this system. If you go through the system, you can reject the finding and then sue. For example, if the compensation program says, "No, this was not a vaccine-induced injury." Then you can say, "OK, the hell with you. I'm going to go sue." On the other hand, all of the material that was presented to the Vaccine Injury Compensation Program is also available as part of a lawsuit. Equally, if you're given an award by the compensation program, you can say, "Oh, that's not enough. I want to go sue." You can do that, but once again, the information and findings of the compensation program are part of it, *and* you forgo the award from the compensation program.

The compensation program doesn't apply for vaccines that aren't recommended for universal use in children. There still is tort liability there. The program has, though, had a remarkable impact on liability relating to childhood immunization. On the other hand, we're not vaccinating as many adults.

Question #10: Why don't physicians want to schedule the vaccines all at once?

Response: It's because of a range of things. There are some people who claim—and even some physicians who say—“Giving five vaccines at once...that's too much antigen for a baby.” Well, it turns out that if you look into the vaccines, they have a lot fewer antigens than the wild organisms. Children are constantly exposed to different antigens.

There is also concern about simultaneous injections. Who wants to watch their child get five shots at one time? Well, actually, parents do! If you say, “OK, Johnny needs five injections. I'll give him all five now, or we can schedule for you to come back every two weeks and give him two today, two in two weeks from now, and the fifth one at the end of the month.” Which would you rather do? You'd rather give him all five shots today. There are variety of reasons for making this choice: Spreading out the shots means taking time off from work to bring Johnny in two more times. It means paying for two more office visits. Besides, Johnny is already crying. Why make him cry two more times? It's a fascinating thing. There have been surveys on this, and it turns out that healthcare workers, particularly nurses, are more concerned about the impact than mothers are!

CLASS EXERCISES

Vaccine Controversy

- The instructor will poll the class, as a whole, about whether they are pro- or anti-vaccination. The instructor will then randomly divide the class into two groups that will represent the pro-vaxxers and the anti-vaxxers.
- Each group is responsible for researching, via the Internet, their respective positions.
- Each group is responsible for preparing a 15-minute presentation about their position. This presentation should rely on historical references, public health data, applicable regulations, and the role of rights in the argument.
- Once the presentations are completed, the instructor will facilitate a general class discussion about the information that was presented.
- The instructor will poll the class following the discussion to see if the initial poll response has shifted.

Public Health Protection versus Personal Freedom

- Divide the class into two or three groups.
- Each group is responsible for researching, via the Internet, a historical example that represents the tension between protecting the health of a population at the expense of one's personal freedom.
- Each group is responsible for preparing a 15-minute presentation to the class about their specific example. This presentation should rely on historical references, public health data, applicable regulations, and the role of rights in the argument.

- Following each presentation, a brief discussion is held to determine whether the class agrees with the outcome of the case or not.

ABOUT THE AUTHOR

Dr. Hinman is the Director for Programs at the Center for Vaccine Equity, a program of the Task Force for Global Health, a non-profit organization affiliated with Emory University. He received his Bachelor of Arts from Cornell University, his medical degree from Western Reserve University, and his Masters of Public Health degree from the Harvard School of Public Health. Since 1965, he has been involved in public health programs at state, national, and global levels, primarily working with the Centers for Disease Control and Prevention based in Atlanta, Georgia. At the Centers for Disease Control and Prevention, he served as

Director of the Immunization Division from 1977 to 1988 and of the National Center for Prevention Services from 1988 to 1995.

In addition, Dr. Hinman has worked for the State Health Departments of New York and Tennessee. He retired from the United States Public Health Service in July, 1996, having attained the rank of assistant surgeon general. He has authored or co-authored more than 400 publications. He has served on the Executive Board of the American Public Health Association and the Board of the Global Alliance for Vaccines and Immunizations, as well as chaired an Advisory Committee for the World Health Organization. He is an Adjunct Professor of global health and epidemiology at the Rollins School of Public Health of Emory University, where he teaches courses on immunization programs and policies, as well as on health and human rights.

Chapter 85

REFUGEE HEALTH IN THE US: FROM INTERNATIONAL POLICIES TO THE AFFORDABLE CARE ACT

Paul Geltman, MD, MPH

Franciscan Children's, Harvard Medical School, Massachusetts, USA

INTRODUCTION

Refugees are the tragic consequences of the unrest that occurs in and between certain countries. Dr. Geltman's lecture outlines the process by which one becomes a refugee and the refugee resettlement process, with emphasis given to the unfortunate consequences that can befall refugee children. Examples specific to the Lost Boys and Girls of Sudan and the conflict in Kosovo are used to highlight the mental health outcomes for these children. Since the health-care system landscape is changing, Dr. Geltman's lecture also introduces the impact the Affordable Care Act may have on health services that refugees receive during the resettlement process.

The question about whether refugee children suffer from discrimination in health care in the realm of public health underlies this lecture, although Dr. Geltman does not address it explicitly. This chapter presents an overview of how small the world truly is with respect to the importance of addressing the health of all populations and why, from a humanitarian standpoint, we need to continue to work to improve the social determinants of health for all. It also reveals a current population that is particularly vulnerable to discrimination because of its needs, as well as its lack of means and power.

In addition, by discussing the process by which refugees come to the US, the process of resettling them here, and the health-care needs that their experiences both abroad and in the US might create, he shows that tensions between public health, individual liberty, and government authority can depend upon factors that are outside of the field of health care itself. These may not be the tensions that we traditionally consider in the US, nor the ones discussed in the other chapters in this book, but they are still important to understanding the interrelationships of liberty and health. Specifically, the crisis situations that turned the

children he discusses into refugees help to explain why those children may have particular health needs—especially mental health needs—even once they arrive in the US. Yet, because the US government and other agencies assist in the resettlement of child refugees in the US, and because the refugees have little means, their care is dependent upon domestic and international politics, especially upon definitions created by treaties and laws, such as the UN Refugee Convention; organizations supported by the government, such as the State Department; and funding provided by political institutions, such as Congress. The US federal government's authority provides the opportunities for refugees to come to the US, as well as the resources upon which they can draw for their needs, thus both opening the door for care and limiting how widely that door is open. Public health issues, very broadly defined, arise because the government, through programs like Medicaid, subsidizes much of the early care for refugees. In addition, (nearly) universal health care is one of the goals of the Affordable Care Act, thus making all kinds of health care a public interest. Finally, because of their political status and means, refugees have little liberty to control their own health care.

LECTURE

About 13 years ago, a group of refugees started arriving in the US from southern Sudan. They became known as the Lost Boys of Sudan. After a group of the youngest of them had been in the US for about a year, I had the privilege of doing what was, in effect, a very unique health-outcomes assessment of them.

As you learned in the introduction, I am a pediatrician, and when I talk about refugee health, usually my preference is to focus on children, although what I say about children is not necessarily specific just to children; some of the issues are much broader, in terms of high-risk groups, even within refugee populations.

I want you to think about how well our current system of refugee resettlement actually works and whether, somehow, we are failing children along the way in this process. I'm going to start with some background about the topic. The United Nations Children's Fund (UNICEF) estimates that of the 57 million plus people displaced by war, more than half are children. Of these millions of children, it's the unaccompanied who are the most likely to be killed, tortured, raped, robbed, and recruited to be child soldiers. Historically, the scope of the problem can be seen when you look at Cambodia in the 1980s: around half of the entire population was under 15 years of age, which is extraordinary; in Rwanda in 1994: in a matter of two months more than 100,000 minors were left unaccompanied as a result of the genocide and the refugee situation and its immediate aftermath; in Angola a year later: during their civil war more than 20% of the nation's children were deemed to have been separated from their parents at some point. Finally, there are known to be more than 100,000 unaccompanied minors in the Great Lakes Region of Africa—the area around Lake Victoria, Lake Kivu, Lake Malawi, places like Burundi, Rwanda, Uganda, southern Sudan.

Many years ago, I had a calendar that featured a picture and a quote from Graham Greene: "There's always one moment in childhood when the door opens and lets the future in."¹ This quote could be a metaphor for child development. Child development occurs in

¹ Graham Greene was a twentieth-century author of fiction. Graham Greene, *The Power and the Glory* (London, Penguin, 1940, reprinted 1991), 12.

spurts and transitions. The image of the door opening and letting the future in struck me as relevant to refugee children, because it's such a time of turbulence in their lives and their development. What happens if something goes wrong and that door doesn't open, or they're not there, or they're at the wrong door, or they're coming from a very non-western culture and they don't know how to use the doorknob? There are so many things that can go wrong for children, in terms of their future development; I keep that old calendar page on my office bulletin board at the State Laboratory in Boston just to remind me of that fact.

Who Is a Refugee?

Who is a refugee? Who am I actually talking about? My work in refugee health is with the government. I do not work with undocumented immigrants because, in the eyes of the government, they are not refugees. They don't have a visa with the government's imprimatur on it so that there's a process to their resettlement.

How does a person become a refugee with a capital R, not a refugee with a little r? Refugee status was defined in 1951 by the UN Convention. It was a time when many of the international human rights documents came into existence [such as the United Nations Declaration of Human Rights], following the European refugee crisis in the wake of World War II. A refugee was defined then as any person who, "owing to well-founded fear of being persecuted... is outside the country of his nationality and is unable or... unwilling to avail himself of the protection of that country... or... return to it."²

In 1980, the Refugee Act formally incorporated this international definition of a refugee into US law. The hope was that the Act would remove the prevailing Cold War geographic and geopolitical or ideological preferences from the determination of refugee status and refugee populations. It established specific procedures about how to deal with refugees, how to resettle them, and how to integrate or assimilate refugees into US society; it also established what programs and services would be provided for refugees and how long they'd be eligible for those programs and services.

Why don't we see refugees from Central America? Well, because we didn't exactly depoliticize this, and, in fact, refugee resettlement is very much a part of our foreign policy and government policy. We really did not recognize the refugee situation in Central America, and so all of the Central Americans who wound up in the US are—in the eyes of the government—undocumented immigrants, not refugees.

Making refugee determinations through official international and governmental channels begins overseas. A refugee, by definition, is someone overseas, and most will be referred to the United Nations High Commissioner for Refugees, usually referred to as UNHCR. Representatives of UNHCR will take referrals, and then they will refer them to the US representatives in refugee camps overseas.

Overall, fewer than 1%—substantially fewer than 1%—will actually ever be resettled in a third country like the US. The most prominent countries currently engaged in refugee resettlement are Canada, Sweden, Australia, New Zealand, and a smattering of other

² United Nations, "Conventions Relating to the Status of Refugees," United Nations Conference of Plenipotentiaries on the Status of Refugees and Stateless Persons, July 28, 1951, accessed January 23, 2017, <http://www.ohchr.org/EN/ProfessionalInterest/Pages/StatusOfRefugees.aspx>.

countries. A smaller number of refugees will self-refer themselves to US consulates and embassies, although usually there has to be some kind of special status that permits such self-referral. Even fewer are referred by NGOs (non-governmental organizations), which make up what's called the overseas processing entity that works with refugees overseas and handles their cases.

The US Refugee Admissions Program is run by the State Department and gets help from the Department of Homeland Security, specifically the US Citizenship and Immigration Services. They have to determine whether individuals meet the definition of refugees. Are they non-combatants? Are they non-perpetrators? Then, in the wake of 9/11, approved applicants undergo a pretty thorough background check, and that can take a long time. If they're approved, they'll be assigned back to the NGOs for sponsorship. All refugees coming to the US have to have a sponsor, someone who's responsible for them.

The NGOs often will help prepare the refugees' applications in the first place, so they're often familiar with the refugees when they come back for sponsorship and processing. They will also often do a cultural orientation prior to departure for the US.

Lastly, the Centers for Disease Control and Prevention (CDC) and their partners at the International Organization for Migration, do an overseas medical screening and arrange for the logistics and transportation involved with migrating to the US.

Refugee Experiences and the Process of Resettlement

Back in November of 2001, I took a photograph of six young men. They were the first Lost Boys of Sudan to enter Massachusetts. They were probably among the first hundred or so to come to the US.

I'm going to use some recordings to try to give you a better sense of what it's like being a refugee and what their experiences were, because I think it resonates much more than hearing me talk about it. This first is a clip from *60 Minutes*:

Narrator: They were known as the Lost Boys because they were between five and 11 when their Christian villages in southern Sudan were attacked by Islamist forces from the north. When they saw their villages burning, they started running. Streams of boys became rivers. Hundreds became thousands until an exodus of biblical proportion was underway. They walked for three months across Sudan, barefoot. Twelve thousand found refuge in Ethiopia. But after four years, they were chased out at gunpoint, chased to the Gilo River where the waters did not part. For Joseph Tabin, that day will never go away.

Joseph Tabin Rufino: We saw so many people who were just floating on the river.

Bob Simon: Dead bodies.

Joseph Tabin Rufino: Dead bodies, yeah, who are floating on the river. ... Many were shot. Many drowned. Many were eaten by crocodiles. Zachariah Magok was there.

Zachariah Magok: One thousand to 2,000 who died in that river.

Bob Simon: One thousand or 2,000 died in that river?

Zachariah Magok: Yes.

Narrator: It wasn't much better on the other side. They walked across deserts, over mountains. They had no food or water. Paul Deng was seven when he started the walk.

Paul Deng: You have to urinate so that you drink your own urine.

Bob Simon: Did you ever do it yourself?

Paul Deng: Yeah. I didn't want to die. Other people didn't want to die.

Narrator: In the spring of 1992, after walking more than a thousand miles, the boys made it over the border into Kenya, to a desolate place called Kakuma. For the UN, it was an emergency of vast proportions, these emaciated children. For the boys, it was the safest they'd been in five years.

Joseph became a medical assistant at the camp clinic.³

So, to summarize, these young people spent 13 years fleeing violence and living in refugee camps; three years first in Ethiopia, then 10 more years in the refugee camp, Kakuma, in Kenya. Can you imagine that? That guy they were interviewing is probably about 22 years old; he probably started this process when he was about eight. Think about him, without his parents, walking across Africa alone. The youngest were preschool-aged children, and they endured severe deprivation as well as the loss of their parents, who were either missing or dead. They walked anywhere from 700 to 1,000 miles, often barefoot. They were stalked by hyenas and lions along the way, and they watched their peers being eaten. They were attacked by Sudanese militias first, then by the Ethiopian military. They had to cross the Gilo River, which was infested with Nile crocodiles. Many of them didn't know how to swim. In one of the interviews, one of them talks about how they figured out that the crocodiles look at you on the surface, so the only way to get across was to swim underwater. If you didn't know how to swim, you were in trouble. Thousands died, not just the 1,000 that the young man talks about, but multiple thousands died crossing that river. Sudan's a pretty big place, of course, and today it is two countries. The area the boys came from, Equatoria, is in southern Sudan, within a triangle including the towns of Bor and Juba and Rumbek. It is estimated that about 30,000 set out; 30,000 kids walking to Ethiopia.

When the Ethiopians attacked them and kicked them out—with helicopter gunships, by the way, firing into the refugee camps—they walked back into southern Sudan and then crossed a mountain range. The southern end of the range includes Kilimanjaro, the Great Rift Valley in Kenya and Tanzania and the Thousand Hills of Rwanda. The boys were at the northern end; they had to cross a 10,000-foot mountain peak, barefoot, emaciated, on their own, starving.

By the time they got down to Kakuma, in about 2001, it's estimated there were only about 6,000 of the original 30,000 left. In photos, the camp in Kakuma looks kind of neat and orderly, but imagine it during the rainy season when all the dirt turns into mud. It was a very hostile and inhospitable environment in which to grow up. In about 2000, the camp had about 50,000 residents, of whom 70% or so—about 35,000—were children. Most of them, or many of them, were unaccompanied.

Lots of kids live in refugee camps. When you have a refugee crisis like this, the internal agencies and other groups involved, the governments, try to come up with what's called a durable solution. So, what can be done with large numbers of refugees in a massive camp like this? Basically, there are three durable solutions.

First, send them back, repatriate them to their home country, if possible; that's the ideal solution. Second is local integration, absorb them into the surrounding community. Sometimes that actually does happen over time. But, Kakuma was in the middle of nowhere. There was no local community into which the refugees could assimilate. Third, which only a tiny percent will ever see, is resettlement in a third country like the US. To get to that point,

³ "The Lost Boys of Sudan: 12 Years Later," *60 Minutes*, Transcript, Produced by Draggan Mihailovich, March 31, 2013, <http://www.cbsnews.com/news/the-lost-boys-of-sudan-12-years-later-21-07-2013/>.

the agencies will often do the “best interest determination,” and this is where we start to get into policy issues.

The best interest determination seeks to identify the most appropriate solution for the refugee crisis; that is, what to do with the refugee population. Sometimes the decisions are population-based; sometimes they focus on specific individuals or subgroups like high-risk groups. For children—unaccompanied children in the case of the Lost Boys—the task is, to quote Anna Freud, to do “what’s in the best interest of the child.”⁴

Health Challenges for Refugee Children

Now, I want to give you my second example of a child refugee: a boy from Kosovo. In the 1990s, Yugoslavia fell apart in civil war. First came the “Bosnian crisis” involving Bosnia and Croatia and Serbia, and then Kosovo, part of Serbia, tried to split away. But Kosovo seceded without the consent of the Serbians. The action spawned a brutal civil war between Serbia and Kosovo.

The video clip that I’m going to share with you, is probably the best narration of a refugee story that I’ve ever heard.

New England Cable News (NECN) had interviewed me previously—very early in my career, when I was working for the Department of Public Health. They came to the State Lab and interviewed me, and I gave them my usual spiel about infectious diseases and trauma. I guess they liked it, and the crisis was unfolding, so the following week they asked me to come into the studio for a live on-air interview.

I thought it was going to be more of the same. They didn’t give me any kind of preparatory materials or anything, and after about 30 seconds they turned to me and said, “You know, we have an example of that. Let’s show the video clip.” The host, Margie Reedy, is a very forceful, eloquent, tall woman. She was around 6 feet tall plus wearing heels, a very empowered presence. I’m a reasonably confident person, but as I say, it was early in my career, and I was thoroughly intimidated. At the end of a brief introductory exchange, she turned to the camera and said, “Let’s watch the clip.”

Margie: This reporter, Dan, has the story of one 10-year-old dealing with the horrors of the war.

Dan: When you’re 10 years old you believe in the Boogeyman. You believe evil visits at night, Dren Caka believed. This morning, Dren describes what he saw.

Dren: [foreign language]

Dan: It was the most difficult night I’ve seen, he said. A group of Serbs came to his home, accused his family of hiding Kosovo rebels, and began shooting.

It was at the Albanian border, and they’ve heard about this happening before, but not with someone this young. He arrived here a few minutes ago with a bullet wound in his arm and a big, a big hole in his life.

Dren: [foreign language]

Dan: They killed my mother and my three sisters, he says. They put guns to their head and shot, and all 19 members of his family died that night.

He told the French medics who flew him to Tirana that people who did this were his Serbian neighbors. “I knew them,” he says. “I’ve seen them around town.” He told the American Air Force medics who treated him when he arrived at the airport that his father escaped just before that terrible night. Then later the Serbs were killing them.

Dren: [foreign language]

⁴ See Joseph Goldstein, Anna Freud, and Albert J. Solnit, *Beyond the Best Interests of the Child* (New York: Free Press, 1973) for more details.

Dan: "After they shot me, I played dead," he said, and waited until they set the house on fire, and then he jumped out the window. He ran to his aunt's house nearby.

Nimate: [foreign language]

Dan: "At first I didn't believe him," she says, "but then I saw his arm." And for this 10-year-old boy, the last memory of his family is his sister lying on the floor.

Dren: [foreign language]

Dan: "I didn't know if they were dead or alive," he says, "but I couldn't help them." The boy had broken his arm and he couldn't even carry his two-year-old sister. "I feel very bad about that," he says.

Don't tell Dren Caka the boogeyman isn't real; he believes.⁵

And that's when Margie turns to me and says, "Dr. Geltman, what did you think of that tape?" I couldn't even speak. This kid is 10 years old. People he knows break into his house in the middle of night with guns; they kill 16 or 19 of his family members, assassination style, bullet to the head. They shoot him in the arm and he only survives because he plays dead in the pile of bodies on the floor of his home. As they're setting the house on fire with him inside it, he climbs out the window, and he sees his two-year-old sister on the floor. He doesn't know if she's dead or alive, but he can't pick her up because his arm is broken. He flees to his aunt's house, and they flee together and escape to safety.

If you're 10 years old, what does that mean in terms of your development, your psyche, your future, and your emotional status? The whole narration centered on the boogeyman and night fears. Kids at this age are supposed to have fears; part of growing up is facing your fears, understanding them, overcoming them, and that's totally shot to pieces for this kid. He's watched his family being killed by people they knew. How is this kid ever going to develop the capacity for trusting relationships and emotional engagement with other people? What about overcoming the fear he's always going to feel in new situations and new environments with new people? How can he trust anybody?

Kids are truly the hidden casualties. There is an article by Bonnerjea entitled "Disasters, Family Tracing, and Children's Rights: Some Questions about the Best Interests of Separated Children," that emphasizes this point.⁶ It goes back a long time in terms of the impact of violence on refugee children.

Dr. Richard Mollica is a Harvard psychiatrist who works with Mass General Hospital. Back in the late 1970s, early 1980s, he did classic studies of adolescent Cambodian refugees in the camps in Thailand, and he showed that even low-level ongoing violence exposure in refugee camps is extremely deleterious, extremely harmful, for the mental health status of these adolescents. Mollica wasn't talking about witnessing a big bomb explosion or being involved with a firefight, after which you're done and you're safe. This was about ongoing violence in the camps—assault, robbery, stuff like that—just the ongoing sort of petty violence that refugee kids will be exposed to on a daily basis. Imagine you're a Lost Boy of Sudan at Kakuma—this is going to be your life for 10 years while you're a child and adolescent.

When processing unaccompanied children, agencies try to trace and reunite families. It's right to prioritize this. But it can be a long process. It can take months, even years. Around a third of the unaccompanied minors in the Great Lakes Region, particularly Rwanda, were reunited with family members—maybe not their parents, but a close family member. That's

⁵ Paul Geltman, interview by Margie Reedy, *New England Prime Time with Margie Reedy and R.D. Sahl*, New England Cable News, April 6, 1999.

⁶ L. Bonnerjea, "Disasters, Family Tracing, and Children's Rights: Some Questions about the Best Interests of Separated Children," *Disasters*, 18, no. 3 (September 1994): 277–83.

pretty successful, but what are the consequences of going through this process? What's the potential impact of that long drawn-out process, and what's going on in that child's life in the meantime? What are the prospects for successful reunification with their family, especially if the child is a youngster and years have gone by? The child might no longer even know their family. Is that really in the child's best interest at that point? And, what happens to all those unaccompanied children in the meantime?

There is this great debate that's been going on historically about orphanages versus foster care of some sort versus group homes. In Rwanda, they did this big push to do foster care placements of kids and get them into homes. That worked out pretty well. They did that pretty effectively. There were a number of big groups like Save the Children and UNICEF. They had a big presence there, and it was a very sophisticated operation starting with the tracing and then foster care placements. How you do that in Kakuma where there are no families? They created families. They essentially did group homes with a family structure where they grouped younger kids with older ones who could help look after them, kind of like a big brother, big sister relationship. That was the best they could do; certainly it was not a true family.

The reality is that in terms of the impact of all of this on kids, studies have estimated that more than 90% of recent refugee populations, at this point, have experienced pretty significant physical and psychological trauma. This is now the universal experience of refugees. It wasn't always that way, but it has become that. I took a picture of a boy in Rwanda. He was just walking along the roadside, hobbling, not walking very quickly. I looked at him for a while and noticed that his ankle was at a right angle. Clearly he had fractured his ankle at some point in the recent past, and it hadn't been taken care of or set properly. He's permanently deformed unless at some point he somehow manages to get some surgical correction. He was just wandering around by himself. I have no idea what his situation was.

Another time I encountered a girl at a Rwandan orphanage at which I did some work with Doctors of the World. She had a zigzagging scar that wrapped all the way around from the back across the side of her head. It was a wound sustained when somebody attacked her with a machete during the Rwandan genocide.

Again, what is the impact of all of this repeated trauma and its aftermath on refugee children? Even if they are not forced to flee, these children live with daily reminders of horror. In Rwanda, it's everywhere: bones lie here and there; there are bullet shells; there are burned out church buildings. Rwanda is a Catholic country and many of the Tutsi population sought refuge in churches. Their attackers blocked the doors and set the churches on fire. There were burned-out church buildings all around Kigali and other municipalities.

In order to talk about the developmental issues, you have to understand a little bit about early childhood and early school-aged children; that age is a process of change and maturation. It's a period of rapid progression in imagination, in communication skills and relationship formation, in knowledge base, and just in how we understand and interact with the world around us. Stress and trauma are known to alter brain neurobiology and neurodevelopment in very young children, particularly in the hippocampus. That creates concrete and predictable cognitive behavioral and emotional impacts or difficulties for kids coming out of this kind of environment. In particular, you need to have a certain basic sense of trust and security to allow for the exploration and mastery of your own environment—that's what you do when you're a school-aged kid: you explore and master your environment.

One day I took another photo in Rwanda and made a slide that you see here. [The lecturer projected a slide.] It's a stunningly beautiful setting. This is Lake Kivu by Cyangugu, Rwanda, and Bukavu, Congo, on the other side of this inlet, which is the beginning of the Kivu River. You can see the rolling hills of the Kivu Mountains in the background, the purple and oranges of the sunset. The water is actually a deep emerald green. It's spectacular.

About a month before I took this picture this whole lagoon was filled with dead bodies.

On this particular day, we were walking along and came upon these two little kids who looked pretty young. They had no pants, just shirts. They were dirty and grubby-looking. They just stopped where they were, squatted down, and did their business on the side of the road. If you look closely, you can see they're squatting over their little puddles of diarrhea. I use this slide when I talk about parasites and malnutrition, but today I'm using it because these kids were clearly displaced children. Whether they were with families or adults, I don't know.

The whole roadway from Kigali, the capital of Rwanda, to this southwest corner of the state was lined with little stick lean-tos that people had constructed while they were fleeing the capital area. Kids just get lost and caught up in all this stuff. There's the whole issue of trauma and PTSD—the kids will attribute responsibility to themselves in the role of guilt and mourning.

It's critical in human development for young children to develop a sense of guilt. This concept goes back to Freud. You have to understand guilt to have a sense of morality. You have to be able to self-regulate yourself. Think of Dren Caka and his boogeyman. Not only is he at an age when kids will attribute magical meaning to objects and events they experience normally, but also there are the issues of guilt. He will blame himself for his sister's death. He will blame himself because he left her there not knowing if she was alive or dead, and that's his fault. Somehow, it's his fault because he lived. It was his fault that his family members died. This kind of magical interpretation of events will heighten fears of reoccurrence and re-experiencing—a hallmark of post-traumatic stress disorder, or PTSD. This re-experiencing will come out of kids in traumatic fantasies and play behavior, like re-enacting a scene or drawing pictures of it. You'll be sitting in class, drawing pictures, and some kid will draw the picture of his family being killed. Children will relive and reenact and remind themselves, and as they do, they will blame themselves for what happened.

Such events impart a sense of vulnerability when a child should be feeling invulnerable. Kids who go through this kind of stuff will have continuing fear and hypervigilance, but no understanding of the concepts of protection and safety, which are necessary for that successful exploration of your environment. That will lead to difficulty with trust and relationships, as well as social withdrawal and numbing of responsiveness, which again, are hallmarks of post-traumatic stress disorder. It can even lead to identification with the aggressors; somehow they were powerful and magical. The aggressors must be the good guys if they were so strong and we were so weak. We let this happen.

In the case of the Lost Boys, the UNHCR hired consultants, specifically mental health experts, to interview the minors in the camp. One of them was Julianne Duncan, someone whom I got to know. She actually wrote the mental health report in the best interest determinations for the unaccompanied minors in Kakuma. She predicted that compared to children fleeing with their family, children fleeing alone would be more likely to be traumatized, to feel responsible for the deaths happening around them, and to develop a sense of insecurity and mistrust. It is basic mental health and social science, and predictable.

In her report, Julianne Duncan wrote that virtually all the children interviewed were experiencing symptoms of trauma. For the boys, it was typically prolonged sadness and grief, sort of an internalizing behavior. For the girls, it was depressive symptoms, specifically around the reality or the prospects of being a girl and being forced into an unwanted marriage. All of them very strongly equated education with safety—it was their opportunity to find safety. There was a strong sense of altruism and a desire to return to Sudan in adulthood to help rebuild their country.

When I did my study, we asked a small subset of our sample to dictate audio narratives about their most difficult or challenging experiences. We intended to do a formal qualitative analysis, but we ended up using them just to give us context to the quantitative responses that we were looking at in assessing their health outcomes. I've never let anybody listen to them, other than my colleagues, but I've created one segment of excerpts from one of these tapes for you. This is a girl, actually one of the Lost Girls of Sudan, who at the time she was telling the story, was, I think, about 16 years old. Her name is Veronica. (We asked them to do it anonymously, but most of them wanted their names to be known.) [Dr. Geltman repeats some of the Lost Girl's words for clarity and comments on others.]

Veronica: We was walking and no car. We're just walking barefoot, no water, nothing to eat. We ate soil sometimes.

Dr. Geltman: She's talking about that first migration to Ethiopia. [They had] no cars, had to walk barefoot, [had] no food, [and] no water. We ate soil. Like in the *60 Minutes* tape, she talks about them drinking their own urine.

Veronica: We were there—like one year on the way coming to Ethiopia. There was lion eating people; people died.

When you're a boy and you are 16, you go fight, or you're 14, you must fight.

Dr. Geltman: Here she's talking about all of the boys being forced or recruited into the Southern Sudanese Liberation Army.

Veronica: ... in Sudan, the school was hard for us.

Dr. Geltman: The desire to go to school.

Veronica: ... and the school was hard. They have brothers or sister who are back in Sudan. The school is too hard for them because they cannot go to school. You don't have parent, you don't have brothers and sisters ...

Dr. Geltman: She's talking about being unaccompanied.

Veronica: When you're a girl, you need to go to work every morning and fetch water.

Dr. Geltman: Talking about being taken in by another family as a girl.

Veronica: ... you don't go to school. You cannot do anything. If you don't clean, you don't wake up in the morning. They beat you. They beat you everyday. Everyday they beat you hard.

Dr. Geltman: You clean, or they beat you everyday.

Veronica: ... until you cleaned the house. You stay home. You don't go to school. You don't go anywhere. You don't. Don't forget us. We're still in Sudan or in Kenya ...

Dr. Geltman: She was talking about all the people who are left behind now. Her friends, people she knows who weren't resettled.

Veronica: ... one time who still meet and who still go back to our country. Go to America, but remember your brothers and sisters who are back in Sudan. They know that you are there for them. You are there in America.

Dr. Geltman: Talking about the feeling of responsibility to go back and give back and do something for their brothers and sisters, which she calls them.

Veronica: Go back to Kenya. It's still hard for somebody. What's important is education ...

Dr. Geltman: This theme of education is safety.

Veronica: I want someone to tell you that I'm going to school. Do this one. Do this one at home. You're excellent. You must go to school. You must ...

Dr. Geltman: Talking about all the help they're getting in the US, which they didn't get in Kenya.

Veronica: ...or they feel we're not people.

Dr. Geltman: They feel we're not people.

Veronica: God made everybody the same. You drink, you eat, you sleep, you talk ...

Dr. Geltman: God made everybody the same. You eat, you sleep ...

Veronica: God made everybody the same.

Dr. Geltman: You talk, you drink.

Veronica: But why that holocaust? Why kill us? Slaving us? Why, God? Why that happened to us?⁷

That's where she ends. And there it is: the whole theme of trust and guilt and blame.

Treatment of and for Resettled Refugees

Let's return now to the US and our laws and regulations about refugee resettlement.

I mentioned the Refugee Act of 1980. That created funding streams called refugee cash assistance and refugee medical assistance. Cash assistance is welfare or, as it's now called, transitional assistance. Medical assistance is Medicaid, basically health insurance.

Refugee medical assistance is the funding stream that pays for short-term Medicaid for refugees who would not otherwise be categorically eligible. You don't just get Medicaid because you're low income, you also have to meet certain other demographic criteria, like having dependent children, being a minor yourself, stuff like that. If you're a young adult, a Sudanese male, like the guy in the *60 Minutes* clip we heard, or the six I also discussed, and you don't have dependent children, you will get Medicaid, but it's only guaranteed for eight months. After that, it is not guaranteed.

Immigration status is very important in our safety-net laws and policy in the US. Back in the 1990s, in that first hundred days' "Contract with America" when the Republicans captured the House of Representatives for the first time in decades with Newt Gingrich, the Congressman from Georgia, in the lead, the Republicans were going to reform welfare.⁸ Bill Clinton went along with it since he had pledged to do something. So, they enacted welfare and immigration reform legislation, which dramatically limited access to any kind of public benefits and programs, such as the ones I mentioned, for most immigrant classes in the US. They did exempt refugees and asylees from most of these exclusions for five to seven years after coming to the US, which is the time it takes to become a citizen. It created a climate of fear, and the whole concept of a "public charge" became an issue.

There are organizations that take care of refugee resettlement in the US. They work under contracts with the Department of State, and they provide a package of benefits and support that includes "resettlement and placement services." Those include housing placement, some case management for a few months, job training, English language courses, and the eight-month eligibility for cash and medical assistance. The funding for this goes to each state that participates—most states do—usually through a single state agency that then disperses it to a local group.

I'm going to just quickly go through some of the outcomes of the Lost Boys. I don't want to dwell on it too much, because it's not really the point of this talk. We found that in our sample of those who filled out the trauma questionnaire, which was 241, 20% met diagnostic criteria for posttraumatic stress disorder. You can look at that two ways—you can say well, only 20%, that's great, or you can say 20%, that's huge.

⁷ Anonymous, research communication to Paul Geltman, December 12, 2001.

⁸ The Republican party released a document titled "Contract with America" in 1994 during the congressional election campaign. In it they detailed the legislation and Congressional action that would be introduced during the first 100 days of their term.

I will say that those 20% had histories that clearly explained why they were the 20%, why they were still showing signs of trauma. The ones who had been in the village when the attacks came had a substantially lower risk of PTSD, because they knew what had happened. Even if their family had been killed, they knew it. But, the Sudanese are a herding people, especially of cattle, and typically, it was the boys who would be out herding the cattle. When the bombs fell, they ran. They fled without knowing what was happening to their families.

We also found that the Sudanese who were placed in group homes, or in foster care alone with an American family, had a much higher risk of PTSD. We think that's because of the sense of feeling isolated and lonely. If they were in a group home, they weren't getting enough individual attention, and if they were alone with the foster family, they felt isolated from their peers and alienated by the cultural divide.

We did a functional-health-outcomes assessment called the Child Health Questionnaire [which is not solely for refugee children], on which, overall, the scores were actually quite good. They dropped significantly on sections about family cohesion and activities, which is not surprising if you're an unaccompanied minor. They were quite low in terms of self-rating general health, mental health, and bodily pain. I'm going to explain bodily pain in a minute.

These functional health scales ask daily-life questions like, "How well do you do at school? Can you go down the street and engage in a pickup game of basketball?" What was interesting was that all of the scores were significantly lower for the kids with PTSD, falling into ranges that were clearly indicative of functional and behavioral health problems. There was a direct linear relationship between their functional health score and their trauma score. You could use the measure of how they did in their daily life, to determine if, in fact, they were suffering from mental health problems.

We looked at their coping and, again, the kids with PTSD were about three times more likely than the kids without PTSD to blame themselves when bad things happened, not to feel close to anyone, and to keep problems to themselves, harkening back to some of those developmental issues that I talked about earlier.

But, remember that Rwandan girl with the scar across the back of her head? Well, she is doing well despite what happened to her. It's not all bad. Some kids will do just fine coming through this kind of a horrible refugee crisis.

Actually, 97% of the Sudanese kids had pretty good active adaptive coping skills, and they were generally able to draw on those skills to help them cope. Largely, they coped well when asked to adjust to life in the US, but there were some, those with PTSD, who had very passive, maladaptive coping skills.

Then there is the bodily pain element. People who have emotional stress or distress will manifest physical signs and symptoms of that distress. It's called somatization. Three-quarters of the Sudanese kids were exhibiting signs that we attributed to somatization, such as problems with their bowels, lack of energy, chest pain, loss of appetite, sleep disturbances, stomachaches, headaches. It was very, very common. They were seeking medical care for this stuff.

We also wanted to know if they were actually getting mental health services specifically to help them with their individual issues. Almost half said they were getting some kind of mental health counseling, but only 31% said they were getting any specific medical care for emotional and behavioral problems that they were suffering. We realized that a lot of this mental health counseling that they were reporting were things like support groups led by a social worker or psychologist that wasn't individualized to them. They weren't being

identified, and they weren't getting individualized services for their needs. In fact, the kids who had PTSD were no more likely than others to report getting individual mental health services.

The Sudanese provide a great example of how this process of coming to the US can create health risks for refugee children or refugees. They also have been the subject of many separate studies. For example, in Canada there was a study that reported that among the Sudanese who ended up in that country those who experienced economic hardship and food insecurity reported poor overall health and greater symptoms of psychological distress nearly four times more than those who did not experience economic hardship in Canada.

There was also a study about the Sudanese who went to Omaha, Nebraska. (Why did they go to Omaha, Nebraska? Because there's lots of beef in Omaha, and the kids were into cattle, so they wanted to go there. Some of the kids wanted to go to Chicago. Why Chicago? Because the Chicago Bulls are in Chicago, and they thought they were going to find cows.) The Sudanese in Nebraska encountered significant barriers to their access of health care and preventive services while engaging in some pretty risky typical adolescent health behaviors.

So, what happened if you were a Lost Boy who came to the US after you turned 18 years of age? You were no longer in the refugee foster-care program for unaccompanied minors. Or what if you were a Lost Boy in the unaccompanied minors program and you aged out of the program at—depending on the state—between 18 and 22 years of age? What happened to you? Nearly all of these young males lost their health insurance and cash support just eight months after arriving in the US. Many of them became destitute, suffered economic hardship, and had no health insurance. They had all their mental health problems and health issues, but could no longer access care.

It is not unusual to cut off aid to refugees. In fact, there's a fact sheet that the State Department actually writes for prospective refugees called "Refugee Resettlement in the US." Most Americans value self-reliance and hard work. They expect newcomers to find jobs as soon as possible and take care of themselves. Assistance provided to refugees is not enough to fully support oneself or family. The message is, "we're going to help you a little bit, but then you're just going to have to suck it up and get on with life." In fact, the airfare to get here is a loan—refugees are expected to pay back the money for their flight to the government.

In the fiscal year 2015 Statement to Congress on the Refugee Admissions Program, Assistant Secretary of State, Anne Richard said, and this is a quote, "Achieving durable solutions..."—there's that policy term again—"including third country resettlement is a critical component of the State Department's work....[T]he US Refugee Admissions Program... [is] an important humanitarian undertaking...by offering a solution to displacement when voluntary return and local integration are not possible."⁹ In other words, we'll resettle you, but that's our last choice.

Resources—meaning the funding refugee resettlement communities seek—will be used to fund the cost associated with the overseas processing and initial resettlement services including housing, furnishings, clothing, food, medicine, employment, social services referrals. This sounds great, doesn't it? Our policy makers and lawmakers believe this is what's happening out there. But what about health insurance? Well, good health, I think, is essential for successful resettlement. Access to health care certainly is a part of that process.

⁹ US Department of State, *Migration and Refugee Assistance, Emergency Refugee and Migration Assistance, Fiscal Year 2015*, Congressional Presentation Document, accessed January 23, 2017, <https://www.state.gov/documents/organization/228806.pdf>.

Health insurance clearly plays an important role—not the whole role, but an important role in access to health care.

The Affordable Care Act

Now, we come to the present day [2014]. Shouldn't the Affordable Care Act [ACA] be a solution?

Well, it could help, perhaps, with access to care. At least, it should, we think, and that certainly is a good place to start if you believe that health insurance is the doorway to access to care. That's not necessarily the case, as we're finding out, but it's certainly a good place to start.

How might this affect refugees? Well, it extended the eligibility for Medicaid to 12 months, which is the usual recertification interval. You may be thinking, "Well, twelve, eight, what's the big deal?" Well, it is a big deal because it puts them in the normal cycle; it gives the refugees a little more time to adjust; it gives them more time to prepare their recertification materials. The ACA also provides the availability to subsidize private insurance for individuals who are not eligible for Medicaid at that 12-month point. Previously, the kinds of policies available to individuals in the private insurance market place were extremely expensive and well beyond the reach of refugees.

Then politics happened. The Supreme Court weighed in and said, in effect, that states do not have to do the Medicaid expansion portion, and so this is what happened.

Let's map this to refugee resettlement now. There are approximately 35,000 refugees in the US who are still in states where, after eight months, they will lose all their benefits and health insurance. In the states that have opted out of Medicaid expansion, refugees will still lose their financial support after eight months. Then they can have access to the commercial insurance marketplace and government subsidies, under the Affordable Care Act, but purchasing new insurance still requires precious financial resources that most refugees can't afford to pay because they're frequently working in very low income, menial jobs.

Conclusion

Let's go back to my first two questions. How well does our current system of refugee resettlement work? Are we failing the children? I will allow you to make up your own minds, but there's no doubt in my mind that we are, indeed, failing. How do we move forward in this area?

The State Department does seem to get it a little bit, I have to say. Some examples of recent initiatives are about unaccompanied alien minors. There are Guatemalan 16-year-olds, picked up by the border patrol in Texas. Previously they would have been detained in a Department of Justice or Homeland Security immigrant detention facility. But, recently, jurisdiction was transferred from the Department of Justice to the Office of Refugee Resettlement, and that made those Guatemalans eligible for the Unaccompanied Minors Foster Care Program. Also, now the State Department is trying to do the overseas best interest determinations much earlier and much more quickly than in the past. Truly, the Refugee

Assistance Program does have the best of humanitarian intentions. Clearly, as in Anne Richard's statement, that's the mission. That's what they believe. It's just a question of how we get there.

So, are we being a little naïve about the consequences of all these policies and how we do things for children? Does the system look good on paper but does it fail when viewed against the developmental trajectories and needs of children? I think, probably, yes. I think we are moving in the right direction, and, honestly, what alternative is there other than peace and not having refugees? We try to do the best we can. Hopefully, we can do it a little better in the future and address some of these issues of refugee children. There are great groups out there who are working really hard towards a better future. I mentioned Save the Children and their work in Rwanda. UNICEF works hard as well, so it's hopefully getting better, bit by bit, but for now, there is much more to be done.

DISCUSSION QUESTIONS FROM THE AUDIENCE

Question #1: Earlier you gave us the definition of who qualifies to be regarded as a refugee. How easy is it to distinguish between immigrants and refugees when you are working with them?

Response: Most people in health care don't care what your immigration status is. They're going to provide services and care for you, period. My work is for a government program that's specifically authorized to work with refugees and people with other equivalent visa statuses, like recipients of political asylum, Cuban entrants, Haitian entrants, temporary-protected-status individuals, victims of trafficking, etc. If you're an undocumented immigrant who might meet an international definition of being a refugee from El Salvador, or a country in Africa, and you come here without proper documentation, or perhaps you had a student visa and you overstayed it, you can still apply for political asylum.

In the late 1990s, the laws changed from having no time limit on the filing process to having to file within one year after your arrival in the US. In the larger picture of being able to get health care or working with physicians, immigration status doesn't matter, but that's not all there is about health. If you don't have money, if you're starving, if you're living on the street because you don't have legal status or proper documentation to be in this country, that's going to impact your health. It also restricts your eligibility for health insurance.

Even if you want to use the doctor, and the doctor's willing to see you, how are you going to pay for that? In Massachusetts, they did away with the uncompensated care pool, and there are some very limited insurance programs for which undocumented immigrants are eligible. Often, they don't have even that insurance, though, so we still have people with this dilemma, even in Massachusetts.

An example of why this whole issue of immigration status is a very important matter in Boston right now has to do with lead poisoning. Today, we see very little lead poisoning, but it used to be a huge issue. About 10 years ago, I realized that the only kids I was still seeing with elevated blood lead levels were undocumented immigrants. They were not able to live in any kind of decent housing because they were poor, or because they did not have legal status

and were therefore not eligible for public housing or subsidized housing under the Section VIII Federal Government Support.

Thus, even today, it's important. I wish it wasn't, but it is. I will, on occasion, ask people what their immigration status is because I want to know if I can help them with health insurance or some kind of benefits or housing. If it's an undocumented immigrant, and they're telling me they're homeless, I can't help them. I can't even get them on a waiting list somewhere. Just forget about it. That's how it plays out.

Question #2: You were talking about the Sudanese, and you also talked about some studies in Canada and Nebraska. You also mentioned earlier that there are a few other countries that actually take a great interest, I guess, in resettlement. I'm thinking that they are countries with a very different health-care system to ours. Could you talk a little bit about how that's played out?

Response: Well, I can't answer that in broad terms because the study I did of the Sudanese here in the US was unique.

It is hard to know, because you can't identify refugees easily. They don't wear a badge or anything; they don't wave a flag saying, "I'm a refugee." Once refugees are here, and they're in the community, after we conduct the refugee health assessment, my program is no longer associated with them. Once they're done, we have no legal authority to be tracking them, following them, pursuing them, doing any further evaluations of them.

The project I did with the Sudanese was not through the state government; I did it in my role as an academician with Boston University. It was facilitated by connections through the state government, but I did it on my own time with funding from Boston Medical Center and Boston University.

I don't know about broader refugee health, so I really can't answer that question. This study is like the Holy Grail, because generally it is unclear how you track the outcomes of refugees. Still, I think it's important to know because the outcomes of refugees are relevant to the larger immigrant communities, or to other similar communities that may face similar situations but don't have refugee status.

For example, we have a lot of immigrants from Uganda and Nigeria. While there's a lot of violence and persecution in those two countries, these immigrants are coming here with green cards and immigrant visas. They blend in very easily because they're English-speaking and they've established communities here. There's a huge Ugandan and a huge Nigerian community in the Boston area, but because they're not refugees, they don't get health screening. We have no contact with them. There's no way really to identify or find them or track them in any systematic way without getting some kind of a big research grant and getting out there and pounding the pavement and finding them. It's a challenge.

Question #3: You stated that 34,000 people would be left out of the Medicaid expansion... Could you try to flesh out the demographic by discussing the states that have refugees? I know you said that the tracking you just mentioned is difficult, but might you have some idea where they came from and how long they stay in a Medicaid program in the states that might be expanding it?

Response: Well, eligibility for benefits is not a strong motivator for people to move from state to state. We call that secondary migration. It's going to affect particular groups in the sense that family reunification is a strong driver of refugee resettlement. You tend to see people gravitate to areas where those communities already exist.

Georgia, for example, has a big Burmese refugee population, so that's been a magnet for current Burmese refugee resettlement. Georgia is one of those states that opted out. So, it's predictable that the Burmese who are going to Georgia are going to be disproportionately affected compared to their peers going to other states. Some secondary migration will occur but not as much as you might think.

Question #4: I was wondering how much information refugees actually get when they come across. For example, you mentioned refugees going to Chicago because of the Chicago Bulls.

Response: They largely would go where they were told, unless there was some family connection dictating it.

Question #5: With respect to the information refugees are given and the choices they are given, is the information being updated with the effects of the ACA?

Response: No. That's not going to happen. The information they're given is quite limited. There're some wonderful videos on YouTube about the cultural orientation, specifically when you look at some of the groups that really need it, like the Sudanese. I mean, these are kids who have never used a flush toilet, they've never seen a doorknob, and maybe not even an electric light switch. The Somali Bantu population, which came in about seven years ago, was the same way. Completely non-Western. They were a rural agrarian persecuted minority in Somalia. They had no clue how to function in our society. The stories about them were just mind-boggling. I have some pictures that I took from the cultural orientation website, which showed them looking up at the skyscrapers; staring at the television, not knowing what it does; and preparing their food on the kitchen floor. Stuff like that. They get this mini-intensive cultural orientation session that the Center for Applied Linguistics does and the International Organization for Migration [IOM] helps with.

There was a guy from Massachusetts named Sasha Chanoff. He was very involved with the Lost Boys, and he did sessions in Kakuma. He's in the *60 Minutes* videos. He's trying to get them ready for winter. I mean, it's not just health you have to consider. Think about it. You're living in the African savanna, never having to put on a coat or long pants or shoes, and then you're going to the winter in New England. They don't even know what that's about. So, Chanoff had a big snowball or ice ball that he kept in the freezer. He would pass it around the audience and say, "This is winter. This is what it's going to feel like. You have to be ready and dress warmly and dress appropriately."

Resettlement education (called "cultural orientation") is about much more than just health care, and there's not a lot of time to do it. It would be wonderful if the refugees could get some kind of intensive ongoing work, but once they are in the pipeline to go, there's not a lot of time. They do what they can, but when the plane's ready to go, they're either on it or they're not going.

Question #6: Who makes decisions about where the refugees are going to go, and how is the decision made?

Response: Once there's a determination made and they pass through their background security clearance, they're assigned to the overseas processing entity, which has representatives from all the different NGOs and the governments. It's like they are playing poker. "OK, this refugee's got family in Boston," says an NGO. "It looks like we have capacity to take somebody in our Boston site, so we'll take them." That's how it works. They are divvied up according to where the capacity is, and where the family reunification dictates. Then that assignment gets passed along to the local affiliate, and that group gets a week or two weeks' notice. The local group will hear, "Refugee X from Camp Y is coming your way next week. Here's the flight information. Be ready. You have to have a house for them. Just get the paperwork going." It all happens very, very quickly.

Sometimes, when there are refugees with health issues, they might have to be expedited into medical care. There have been plenty of instances where people travel with a medical escort, and they've gone straight to a hospital after arrival. The transition period into the US is a very stressful grueling time.

Question #7: How much ongoing social casework is done with them? I use a book with some of my students called *Outcasts United* about a refugee soccer team that ends up in the Atlanta area.¹⁰ I have no idea how typical that experience is, but it sounds like they get inadequate furniture, very limited social work, and no ongoing case management. Is that typical?

Response: That's all true, but didn't it sound great when I read from Anne C. Richard's statement? That made it seem like we're looking after these people and taking care of them, but then there's that other quote that I read to you that said, basically, "Sorry. Government support is not enough. To really support yourself, you've got to work." That's the reality check, but that's not the public face of it.

I remember being stunned when I realized this; maybe I was naïve myself at the time. I went to a national meeting sponsored by the federal Office of Refugee Resettlement (ORR). Back in the last few years of the Clinton administration the head of the Office of Refugee Resettlement gets up at her plenary—this is at the height of the welfare and immigration reform debates—and proudly declares that refugee resettlement was the first welfare reform program. She says, in effect, "We get refugees to work. We cut their public support at eight months, and they have to be self-sufficient." She was proud of this, and I was thinking that this is awful because six to eight months is when they're all crashing. That's when the euphoria is ending, and the reality is setting in.

There's a whole system called mutual assistance associations that the ORR actually helps fund. These are like ethnic refugee community organizations. Typically, they're very small groups that provide some support to refugees going forward, but they're not big, well-established social service agencies. I used to be on the board of the Somali Development Center in Boston. I remember there were plenty of days when they would pass a hat around

¹⁰ Warren St. John, *Outcasts United: An American Town, a Refugee Team, and One Woman's Quest to Make a Difference* (New York: Spiegel and Grau, 2009).

the table for the six of us saying, “There’s this family in crisis. We need to help them. Give them some money.”

Question #8: Looking into the crystal ball of climate change and the forced migrations that will be brought about and the populations that will be on the move fleeing droughts or fleeing floods—if you believe the American Academy of Sciences’ strategy for climate change—what challenges will that pose for this kind of statutory framework here in the US or globally? What would you recommend to beat those kinds of challenges as a pediatrician and epidemiologist?

Response: It’s a good question, and really gets into the larger picture. In terms of its potential effects limiting the world food supply and clean water, is climate change going to exacerbate refugee crises as well as sectarian tensions leading to more civil wars? I would say clearly the answer is, yes.

Already, we’re seeing it in Sudan where they’re having a drought that, in the context of the Nuer-Dinka Civil War, they’re predicting is going to be on the scale of the Ethiopian famine in the 1980s.

It’s going to be a problem, and the reality is, as I mentioned, far fewer than 1% of the world’s refugees ever get resettled, so the misery that these people are going to live in is going to continue. We’re probably going to be seeing more and more of these kinds of situations unless we start dealing with it. At least in the US, we seem to have our heads in the ground trying our best to ignore it. Or, sometimes you get responses like the one from the mayor of Manchester, New Hampshire: “Stop sending us refugees. We don’t want any more refugees. End it.” Or, perhaps Congress will say, “OK. This isn’t working. You don’t like it? Not enough money? Let’s cut it. End the budget. No more refugee resettlement to the US.”

I don’t think anybody involved wants to see that happen because all of us—even if we’re not doing it well or well enough—recognize that it needs to be done for humanitarian reasons.

CLASS EXERCISES

Lost Boys of Sudan

- As a class, watch the video, *The Lost Boys of Sudan*, available at <http://www.lostboysfilm.com/>.
- Following the film have the class spend 10 minutes writing a short reflection piece on what they have seen. What surprised them the most? What is their overall reaction to the plight of this population?
- What health issues were, or should have been, touched upon?
- Lead a class discussion on how the refugee resettlement process can be improved.

Refugee Resettlement Process

- Divide the class into groups that will represent different states in the nation (e.g., Massachusetts, New Hampshire, Maine, Nebraska, Georgia, etc.)
- Each group is responsible for researching, via the Internet, the refugee resettlement process in their state. Be sure to note the specific agencies and timelines involved, as well as what refugee populations have been resettled over the last 10 years and how this has changed over this time period.
- Develop three feasible ways in which the refugee resettlement process can be improved in your specific state. Be sure to include thoughts about managing health issues that might arise.
- Each group presents a brief overview of their respective state's refugee resettlement plan, highlights the two most important factors that should be implemented to improve refugee resettlement, and gives their rationale for the selection.

ABOUT THE AUTHOR

Dr. Paul Geltman is a graduate of Princeton University and received both his MD and MPH degrees from the George Washington University School of Medicine and Health Sciences.

He is Assistant Professor of Pediatrics at the Harvard Medical School and Associate Professor of Health Policy and Health Services Research at the Boston University Goldman School of Dental Medicine. He is also the longstanding medical director for Refugee and Immigrant Health in the Division of Global Population and Infectious Disease Prevention at the Massachusetts Department of Public Health.

He practices primary care pediatrics at Franciscan Children's in Brighton, MA, where he is Medical Director of Ambulatory Care Services.

Dr. Geltman has worked in clinical policy and public health settings with refugee populations both in Massachusetts and in Rwanda. For the Department of Public Health, Dr. Geltman oversees clinical aspects of the Commonwealth's statewide health-screening programs for newly arriving refugees and other related health programs, and he served on the leadership committee of the Refugee Health Technical Assistance Center.

ABSTRACT

Over the past decade, the Caribbean governments have turned their attention to tackling the rising prevalence of non-communicable chronic diseases, in particular, hypertension, diabetes and cancer. The emergence and rising prevalence of these lifestyle diseases are suggestive of a correlation with the cultural transformation that overtook the region. In the first quarter of 2020, the region's health landscape turned another corner with the emergence of the COVID-19 pandemic, demanding urgent public health and clinical interventions to address an infectious disease. Improving the health status of Caribbean populations is at the forefront of the agenda of the regional public health institutions and, in producing this book, we provide support for evidenced-based public health practice in the Caribbean region. We hope readers find the issue informative to understanding the public health situation in the Caribbean and will motivate affirmative action to improve public health.

INTRODUCTION

This book is a collection of research and reviews that reflect pertinent public health themes in countries in the Caribbean region. Those themes precipitated from recent research and the insights of the authors who actively engaged with the regional and local public health systems. Many studies have been published, albeit, never before was a production made, bringing an array of public health themes together in the literature to readily provide a comprehensive overview of public health successes and challenges in Caribbean countries. The motivation to write this book came from the expressed yearning to have a fuller understanding of the direction in which public health activities may be focused to improve health and wellness of the Caribbean peoples. Sharing the results and recommendations in this book is especially valuable within the context of the limited resources that is available in the region for a wide range of studies to generate evidence related to public health. This limitation in the region hinders proportional response to significant events.

The information in this book is valuable for many audiences, including public health practitioners, health planners, and policymakers. Incorporating the content in academic settings is a positive step towards developing a conscientious and well-informed next-generation workforce. In this issue, we highlight reviews of the regional public health systems and country-based research findings and recommendations. Readers can deduce information about health status and public health needs in the region. Apart from contributing to inform capacity building, the results and recommendations presented by the authors provide directions to guide in the development of affirmative actions to improve the responsiveness of the regional public health systems. The themes in this book highlight the need for collaboration of the local and regional agencies to mobilize for action and to be more effective in the responses.

The efforts of Caribbean governments and public health institutions to address vulnerabilities and risks, in particular, for non-communicable chronic diseases, are well recognized. This book highlights the current pertinence and complexities of this issue in the region. Readers have an opportunity to make judgments about progress in addressing the problems in respective countries as well as to extrapolate results to predict the situation regarding non-communicable diseases in a broader sphere. At the same time, in the current period of the COVID-19 pandemic, greater emphasis is needed to manage and tackle infectious diseases. Health practitioners, planners, and policymakers may do well to apply the findings and recommendations in strategizing to improve the health and well-being of the Caribbean people. The themes also highlight the need for ongoing research to deepen understanding about health in the region.

We extend special thanks to the authors and reviewers for their contributions to this edition. Thanks to the faculty at St. George's University (SGU) in Grenada and the staff at the Caribbean Public Health Agency (CARPHA) in Trinidad. Improving the health status of Caribbean populations is at the forefront of the agenda of the regional public health institutions and, in producing this book, we provide support for evidence-based public health practice in the region. We hope readers find the issue informative to understanding public health in the Caribbean region and that the information will be transformed into affirmative actions to improve the health and well being of the peoples.

ABSTRACT

The health of Caribbean economies is closely related to the health of its travel and tourism industry, given that the Caribbean is the most tourism-dependent region in the world. The global spread of the novel coronavirus pandemic (COVID-19) was propelled by travel and is threatening the health security of the region while, at the same time, disrupting tourism and reducing revenues in Caribbean economies. The Caribbean Public Health Agency's Regional Tourism and Health/Travellers Health Program is an innovative program that is addressing the health, safety, and environmental sanitation threats to tourism, with the aim of strengthening regional and national health systems and enhancing the health of visitors and locals. This unique program adopts a multi-prong (real-time early warning and response tourism and health information system (THiS), regional guidelines, food safety and environmental sanitation training, hospitality health safety and environmental standards, policy), and multi-sectoral (regional and international health and tourism partners) approach for implementation. The program has built capacity and equipped countries with regional tools that support preparedness and response to public health threats like COVID-19. This is the first integrated program of its kind, setting an international precedent for improving sustainable tourism and regional health security.

INTRODUCTION

The United Nations Sustainable Development Goals are the blueprint for achieving a better and more sustainable future for all. Goal 3 calls for ensuring healthy lives and promoting well-being at all ages and Goal 9 requires building resilient infrastructure, promote sustainable industrialization, and foster innovation [1]. The Regional Tourism and Health/Travellers Health Program (THP) was established to promote regional health security and sustainable development throughout the region. This paper describes how the THP is supporting the preparedness and response to the novel coronavirus outbreak, declared a pandemic on March 11, 2020.

Background

The Caribbean region is one of the world's most prominent travel destinations, famous for its tropical weather, crystal blue waters, white-sand beaches, and vibrant culture. These features make the region an attractive destination to foreigners, particularly those seeking to escape colder climates. The tourism industry is crucial for Caribbean economies as it a primary revenue source. According to the World Travel and Tourism Council's (WTTC), tourism is a principal source of employment, foreign currency and economic growth in the Caribbean, accounting for approximately 2.5 million jobs or 15.5% of total employment contributing to 5.8% (US \$9.2 billion) to region's Gross Domestic Product (GDP) [2], illustrating the dependency of the Caribbean region on the tourism industry.

Caribbean tourism is vulnerable to many external factors, health being one of them. Due to its tropical climate, the region is highly vulnerable to outbreaks associated such as Chikungunya, Malaria, Dengue, and Zika. Negative health publications against an island or unmanaged epidemics can seriously harm the inflow of tourists and tarnish the reputation of Caribbean tourism destinations. Without a market, the Caribbean economy suffers from a fall in tourism generated revenue.

REGIONAL TOURISM AND HEALTH PROGRAM

The Regional Tourism and Health/Travelers Health Program (THP) is a novel, innovative, multi-sectoral, multifaceted program that aims to strengthen regional and national health systems by addressing the health, safety and environmental sanitation (HSE) threats to tourism, and thereby enhance the health and safety of visitors and locals, regional health security, and the quality, reputation, and sustainability of Caribbean tourism (website: <http://carpha.org/What-We-Do/Tourism-and-Health-Programme>).

The program is being executed by the Caribbean Public Health Agency (CARPHA), the Caribbean's sole public health agency responsible for preventing disease, promoting and protecting health, in collaboration with the Caribbean Hotel and Tourism Association (CHTA), the Caribbean Tourism Organization (CTO) and countries. The program is improving countries' capacities to provide cost-effective, quality health, food safety and environmental sanitation (HSE) solutions to the HSE threats impacting on sustainable tourism

in the Caribbean through real-time, early alert and response monitoring systems for tourism-based health issues; training and certification, HSE standards, and multi-sectoral regional and international partnerships. Countries gain enhanced capacity to mitigate against HSE threats to sustainable tourism. This integrated, multi-sectoral program is the first Caribbean-wide and global effort of its kind, setting an international precedent for improving sustainable tourism. The program is timely as new threats to health and travel in the region emerge.

The Caribbean depends on visitor arrivals more than any other region in the world, with over 55M visitors in 2019 [3]. High and increasing numbers of visitors to the Caribbean region increase the health, safety, and security risks to local populations. Travel/tourism-related illnesses are not only a health and security risk but contribute to reputational damage and economic instability in Caribbean economies. This is evident through the introduction and spread of new and re-emerging diseases, such as SARs, H1NI, chikungunya, zika, norovirus, measles, and now, the novel coronavirus (COVID-19) pandemic, by visitor populations. The health of Caribbean economies is thus closely related to the health of its travel and tourism industry, given that the Caribbean is the most tourism-dependent region in the world.

However, even though more people visit the Caribbean than reside, current health monitoring surveillance systems are primarily based on the local population, and there is no ongoing visitor tourism-based surveillance and response system. There is also inadequate food and environmental sanitation training for the tourism sector, lack of cumulative HSE standards and certifying system, and a marked lack of integration between tourism and health stakeholders to address health in tourism in the Caribbean region. These gaps have all contributed to the spread of disease outbreaks, food safety, and environmental sanitation issues in the region; and without adequate information management systems, standards and training, these HSE threats can become a severe tourism crisis. These risks and the importance of the tourism industry in the Caribbean region highlight the need for a system to monitor both traveler's and resident's health, provide rapid dissemination of real-time information, and respond quickly to prevent and control outbreaks. It is within this context that CARPHA established a Regional Tourism and Health Program in 2014, with funding received from the International Development Bank in 2016 to execute.

The THP is strengthening countries' capacity to prepare for and respond to public health threats like COVID-19, which can transcend national boundaries and negatively affect access to goods and services, through the following regional public health goods which have the potential to strengthen regional health security:

- 1) Tourism and Health Information System
- 2) Regional Guidelines for a harmonized response to travel-related public health issues occurring among visitors to the Caribbean arriving by sea (passenger ships) and air (accommodations).
- 3) Advanced Food Safety, Environmental Sanitation capacity building, and certification.
- 4) Hospitality Health Safety and Environmental standards
- 5) Partnerships, Mandates, and Policy

Figure 1. Primary surveillance pathway for the THiS web app.

Each of these components is discussed below and linked to possible COVID-19 preparedness and response actions.

Components

The Tourism and Health Information System (THiS) is a web-based application for syndromic surveillance of populations in tourist accommodations (website: <http://www.this.carpha.org>). This real-time, early warning system is confidential and only accessible by national authorities. It is currently being implemented in hotels and guest houses in eight countries (Bahamas, Barbados, Belize, Guyana, Jamaica, Trinidad and Tobago, Bermuda, Turks and Caicos Islands).

The THiS web app was designed to enhance national surveillance systems by monitoring illnesses in tourist accommodations to identify public health threats early. Figure 1 shows a schematic of how the THiS web app integrates into the existing national and regional public health surveillance mechanisms.

Data Collection and Reporting

Data collection in the THiS web app is conducted by staff from registered tourist accommodations, using an online questionnaire administered to an unwell guest or staff member. Accommodations are also required to confirm the absence of cases by epidemiological week using a “zero case” submission on the web app page. Also, the self-reporting page allows visitors and staff to independently report their illness using an online questionnaire located on the THiS web page: this.carpha.org.

The online questionnaires are similar for reporting by registered facilities and self-reporting. The questionnaire includes short questions that ask the user for necessary demographic information such as age and gender, potential exposure information such as recent travel and home country, and most importantly, which symptoms they are experiencing:

- 1) diarrhoea (≥ 3 loose or watery stools in past 24 hours)
- 2) vomiting and/or nausea
- 3) fever (sudden onset of fever $>38.0^{\circ}\text{C}$ or 100.4°C)
- 4) cough or sore throat
- 5) bleeding (gums, nose, blood pooling under skin coughing, stool) not due to physical trauma
- 6) headache
- 7) joint or muscle pains
- 8) eye pain/headache/facial pain,
- 9) generalized rash,
- 10) blurred vision or convulsions or altered consciousness

Figure 2. The logic used to generate syndromes from reported symptoms (based on Case Definitions for Syndromes under Regional Surveillance, CARPHA).

Responses to these symptoms are analyzed in the system to generate (see Figure 2) potential syndromes for each case:

- 1) Gastroenteritis
- 2) Undifferentiated fever
- 3) Fever and hemorrhagic symptoms

- 4) Fever and neurologic symptoms
- 5) Fever and respiratory symptoms
- 6) Fever and rash

Data Analytics

Data analytics are executed on the inputs from each facility on the THiS web app. The dashboard provides interactive data visualizations and allows the user to slice the information to view cases among guests vs. staff, by facility (for national users only), by country (for regional users only), and for all users by gender, age, and time (weeks vs. months vs. year) facility and national level—for MOH users), and time (case counts by day, week, month, or year). Access is limited to hotel management (i.e., hotel manager, health and safety manager), who would be persons engaging with public health staff at the MOH in the event of a potential public health issue such as an outbreak. At the Ministry of Health, access is given to users determined by the countries health focal point and typically includes an epidemiologist, surveillance officer, and/or Chief Medical Officer (CMO) or Environmental Health Officer. At CARPHA, access is limited to the THP epidemiologist and Project Coordinator.

Regional Guidelines

Two sets of regional surveillance guidelines were developed:

- Regional guidelines for managing issues of public health significance on passenger ships coming to the Caribbean (Caribbean Vessel Surveillance System (CVSS)), and
- Regional guidelines for managing issues of public health significance in stay-over arrivals (Tourist Accommodation-Based Surveillance) in the Caribbean

These guidelines, collectively called the “Regional guidelines” (see Figure 3), were developed to provide instructive guidelines for harmonized scientific response to travel-related public health issues occurring among persons aboard passenger ships and those in stay-over arrivals (tourist accommodations) in the Caribbean.

A key challenge in the tourism-dependent Caribbean countries is the marked variation and lack of standardization in the surveillance and response to travel-related public issues occurring among visitors arriving by sea and those in stay-over arrivals. Although the core competencies and protocols for investigating and reporting public health emergencies on passenger ships in the Caribbean are described in the 2005 International Health Regulations (IHR), how these are implemented vary by country, since each country is sovereign. The commonality of tourism-based illnesses, nearby borders, and frequent travel (both intra-regional and international) in the Caribbean necessitates the need for uniform and harmonized surveillance and response to travel-related public health events. This harmonized approach aims to avoid the introduction of new diseases, mitigate the spread of illnesses, and protect the health and security of visitors and locals.

Figure 3. Regional guidelines.

CARPHA, as the Caribbean authority for public health surveillance, developed the Guidelines for harmonized surveillance and response to travel-related public health illnesses to prevent and mitigate public health events on passenger ships and in stay-over arrivals in the Caribbean region. It will support countries in carrying out public health action to manage issues of public health importance in a timely and coordinated fashion and thus protect the health and security of visitors and locals. It will also allow for the collection of surveillance data to establish baselines for outbreak detection and strengthen national surveillance.

The Guidelines are based on the IHR (2005), the World Health Organization (WHO) management of public health events onboard ships (2016) and other documents developed over a 3-year period involving country and agency consultations; and in close collaboration with the Cruise Lines International Association (CLIA) and CDC Vessel Sanitation Program (VSP). It was presented to the 33rd COHSOD, endorsed at the 2018 CARICOM CMOs meeting, and supported at the 2018 Regional Tourism & Health Stakeholder workshop (13 agencies, 14 countries).

Advanced Food Safety and Environmental Sanitation Training

Food safety affects the health, wealth, and reputation of countries. Diarrheal illness resulting from contaminated food or water (FBD) is the most common health problem faced by visitors to the Caribbean. In the last 15 years, the Caribbean has experienced an increase in the number of large and costly visitor-based outbreaks of illness, with negative impacts on the tourism industry. From 2010-2016, over 250 outbreaks of gastroenteritis (GE) from 23 countries were reported to the CARPHA, 15% occurring in hotels/resorts, and accounting for over 25,000 cases. One outbreak in 2012 resulted in over 800 ill persons, hotel closure, and a 20% decline in arrivals. Investigations of FBD outbreaks have repeatedly demonstrated that they were costly, yet preventable. The root causes of these illnesses were traced to inconsistent attention to existing food and environmental safety standards, inadequately

trained staff, and a lack of an effective monitoring and reporting system. Reducing the incidence of FBD is, therefore, a continuing challenge to the Caribbean hospitality industry. The most effective tools for preventing foodborne and other illnesses are science-based food safety management, education, and training.

The THP provides advanced food safety and certification train the trainer course for health and hospitality stakeholders This training is done by certified regional experts, using the globally recognized SERVSAFE food safety material uniquely infused with the Caribbean experience based on CARPHA's illnesses investigations of public health threats. SERV Safe is the internationally recommended comprehensive capacity-building proficiency course, using practical science-based knowledge and skills. It builds countries' capacities in the areas of advanced food safety, illness causation and prevention, outbreak response, and environmental sanitation (see Figure 4). It will also allow for globally recognized certification through the internationally recognized USA National Restaurant Association Educational Foundation (SERV Safe).

Figure 4. Topics covered in Advanced Food Safety and Environmental Sanitation Training.

Hospitality Health Safety and Environmental (HSE) Standards

Seven Caribbean-wide health safety and environmental (HSE) “clean and green” hospitality standards have been developed to improve health, safety, and environmental quality in the hospitality sector. These standards were developed under the authority of the CARICOM Regional Organization for Standards and Quality (CROSQ) through CARPHA THP. These are now being submitted for approval as the CARICOM Regional Hospitality Standards to the CARICOM Council for Trade and Economic Development (COTED):

- 1) Energy management and efficiency
- 2) Food safety and sanitation for the tourism industry
- 3) Environmental management systems for the tourism industry – Guidelines
- 4) Integrated pest management for the tourism industry
- 5) Sewage treatment and management for the tourism industry
- 6) Solid waste management for the tourism industry
- 7) Water treatment, management and efficiency for the tourism industry

Figure 5. Hospitality health safety and environmental (HSE) standards.

The adoption and implementation of these standards by the Caribbean tourism industry will significantly reduce the adverse impact of HSE issues, which in turn would increase the contribution of the sector to the economic well-being of the region. Implementing these standards will be the comparative advantage, as it would protect the region’s fragile environment and lead to a safer and better-quality environmental product, and a standards-based certified destination, which increases the comparative advantage of Caribbean tourism. Substantial benefits are possible if these standards are adopted and referenced in legislation/regulation that can be made sufficiently similar across the Caribbean Region. One such benefit is a substantial improvement in health food safety and environmental sanitary conditions in the hospitality sector throughout the region. The implementation of the standards would be recognized by the Association of British Travellers (ABTA) and other tour operators. Certified facilities would also be published on CTO, CHTA, CARPHA websites.

Partnerships, Mandates, and Policy

The THP developed a Regional THP Policy Framework to mandate the reporting of tourism/visitor illnesses to national authorities from the hospitality sector for the successful implementation and sustainability of the THP. The regional THP Policy Framework aims at ensuring an enabling environment for optimal implementation of the THP and its components. The Regional THP Policy Framework is a critical tool in the drive to secure the Caribbean Region's health security. Implementation of the Policy provides a basis for creating a sense of urgency among hospitality sector partners and travelers to reduce the risk posed to people in the Caribbean by communicable disease outbreaks and public health emergencies, through early detection and a strengthened rapid response.

- In 2017, the 33rd CARICOM Council of Health Ministers (COHSOD) mandated CARPHA through the THP to prepare a draft tourism/traveler's health policy for improving regional health security.
- During 2018-2019, through a consultative process, the Travellers Health Policy Framework was developed
- On September 29, 2019, the Regional Travellers Health Policy Framework was approved at the 37th COHSOD

Partnership

The THP involves the implementation of a new non-traditional health information and monitoring system (i.e., tourism/visitor-based illnesses), new clients/data users (private sector hotels, cruise ships, visitors), and new partners (Ministry of Tourism, tourism authorities, tourism agencies). In this regard, a critical factor for successful implementation and sustainability of the program is global and regional recognition, partnership development, and endorsement from international public and private health and tourism agencies. The THP, starting with an MOU between CTO and CHTA, is building multi-sectoral, multi-agency partnerships with regional and international health and tourism stakeholders to address travel-related public health threats in a rapid and well-coordinated manner for seamless information flow and response to traveler's illness across regional and international borders. Other key partners to date include CROSQ, VSP, Public Health Agency Canada (PHAC), and Public Health England (PHE) and Cruise Lines International Association (CLIA), Association of British Traveler (ABTA).

DISCUSSION

Surveillance is critical for protecting and improving population health. In particular, during a pandemic such as COVID-19, public health officials must be able to rely on a system that produces real-time and accurate data on the outbreak, collected and monitored over time, directly from the communities, so that they can rapidly identify and implement the most effective interventions. In a region such as the Caribbean, consisting of

small islands developing countries and territories, where tourists/travelers outnumber residents, there is a crucial need for a surveillance system that goes beyond national public health surveillance platforms. The Tourism and Health Information System (THiS) web app meets this requirement by monitoring illnesses among visitors and staff in tourist accommodations, in real-time. From January 2017-February 2020, the THiS was successfully implemented in 254 hospitality accommodations in eight countries (Bahamas, Barbados, Belize, Guyana, Jamaica, Trinidad, Tobago, Turks and Caicos Islands). Before its establishment, no system was in place to compile disease data on this population. The systems can detect aberrations in patterns of illness among travelers, which is even more important if they originate from multiple nations or regions. The strength of the platform is also that the visitors themselves are considered as part of the surveillance system. Being able to collect these data in the context of the COVID-19 pandemic cannot be overstated. It allows reporting of more comprehensive and timely data about the outbreak to public health officials.

Pre COVID-19, the THiS has been instrumental in identifying important clusters of illness that that would not have been reported through current national systems, resulting in a rapid action to prevent further spread. This innovative travel/tourism syndromic surveillance crucial during this COVID-19 pandemic for strengthening existing core national health surveillance systems of tourism-dependent Caribbean economies to collect real-time data for early alerts and triggering a rapid coordinated response. CARPHA is promoting the reporting of illnesses, including suspected cases of coronavirus, on THiS both by hospitality accommodation and self-reporting, as a proactive COVID-19 surveillance measure. This pandemic is a reminder that our first line of defense starts with people. We must consistently protect ourselves so that we are more prepared.

Advanced Food Safety Training

There is no evidence that food or food packaging is directly involved in the transmission of COVID-19 [4]. Unlike foodborne gastrointestinal viruses that can make people ill through contaminated food, SARS-CoV-2, which causes COVID-19, is a virus that causes respiratory illness. The main transmission occurs from person-to-person, either between people who are in close contact with one another or through respiratory droplets produced when an infected person coughs or sneezes [5]. However, a person can also contract COVID-19 by directly touching surfaces that have "cough or sneeze" droplets from an infected person, and then touching their mouth, nose, or eyes. For that reason, it is more critical for food handlers to follow the four key steps of food safety: clean, separate, cook, and chill [4]. The advanced food safety and environmental sanitation training contributes to COVID-19 prevention by building capacity and reinforcing behaviors that help avoid coming in contact with the virus (and pathogens in general): frequent washing and sanitizing of all food contact surfaces and utensils, frequent hand washing and glove changes before and after preparing food, frequent cleaning and sanitizing counters and condiment containers. To date, almost 600 health and hospitality workers were trained in the eight implementing countries, providing a solid platform of knowledge and training for proper hand hygiene, cleaning and sanitizing, and other behaviors to prevent COVID-19. Implementing and or reinforcing the food safety and environmental sanitation programs is essential to maintaining a hygienic and safe

environment, keeping the risk of infectious diseases and COVID19 outbreak low and customers and staff healthy.

Hospitality Health Safety and Environmental (HSE) Standards

According to WHO, “the provision of safe water, sanitation, and hygienic conditions are essential to protecting human health during all infectious disease outbreaks” [6]. Although the risk of contracting COVID-19 from the feces of a person is low and there is no evidence about the survival of the virus in water or sewage, implementation of the Caribbean-wide Health, Safety and Environmental “clean and green” Standards will further contribute to preventing transmission of communicable diseases, including the COVID-19 pandemic. In particular, the HSE standards encompass different components that are relevant to mitigate the spread of the virus: within the Food Safety and Sanitation component, frequent and proper hand hygiene is one of the key measures to prevent contamination and transmission and disinfection will facilitate more rapid die-off of the virus. These HSE standards constitute a critical component of a set of preventive interventions to enhance not only the region’s capacity to respond to the public health threats, but also to support the region’s drive towards achieving quality and sustainability and to remain competitive in this rapidly growing global tourism trade.

RESPONSE TO COVID-19 THROUGH THP

Regional Guidelines

The COVID-19 pandemic is causing worldwide disruption and challenge for response in countries. Responding to this pandemic and other emerging and re-emerging infectious diseases in the tourism-dependent, small island developing states like the Caribbean region requires a strong, harmonized coordinated regional approach, given the proximity and interconnection between the islands, their limited and varying capacity to quarantine to respond (test, isolate, treat, and contact tracing). CARPHA is leading the regional health response to COVID-19, in keeping with its Intergovernmental Agreement (IGA) mandate from CARICOM and recommendations from COHSOD- Health working group on regional coordination for management. As such, CARPHA convened the Regional Coordinating mechanism for Health Security (RCM-HS), consisting of Member States, regional and international agencies, to work with its partners and countries, towards a harmonized regional response.

Tourism and Health Information System (THiS)

The web-based application, THiS, allows monitoring and provision of alerts in real-time on the health of guests and staff members. In particular, when indicating the symptoms the tourist(s) or staff member(s) are experiencing, fever, cough/sore throat/difficulty breathing,

diarrhea [6-8] – known symptoms of COVID-19 – can be captured as well as information on recent travel history. Those symptoms can trigger an immediate response following the Regional Guidelines for Managing Issues of Public Health Significance in Stay-Over Arrivals in the Caribbean. Time is of the essence in the fight against the virus. Being able to detect and respond immediately to potential new COVID-19 outbreaks but also assess the impact of the measures taken on the trends of illness reported, can buy the world precious time to contain the spread.

Multisectoral Partnerships

Public health emergency preparedness and response aim to minimize the risks posed by communicable diseases and mitigate their impacts. Sharing and aligning activities in public health emergency preparedness adds value to efforts of single countries to strengthen their capacities and ensure coordinated, effective support with cross-border health threats. Responsibility for the preparedness and the response lies not only with public health agencies but involves every level of government, the private sector, non-governmental organizations, and individuals. In particular, tourism is currently one of the most affected sectors by the COVID-19 crisis as it is based on interaction amongst people. Guiding the tourism sector's response requires strong public-private intersectoral partnerships at national and regional levels between tourism, health, and environment stakeholders. This is the only way to support a rapid and well-coordinated approach to managing the pandemic – and this is what the Tourism and Health Program has executed since its inception. In response to the crisis, regular webinars were convened with CHTA, CTO members, and regional Ministers of Tourism to provide technical guidance to the hospitality sector for mitigating the spread of the virus throughout the region.

COVID-19 Situation reports, travel brief, and travel advisory providing a consolidated view of the health situation in the Caribbean are communicated every two days to countries, regional agencies (CARICOM, CDEMA, IMPACs) international development partners (World Bank, IDB, EU, ECDC, CARICOM, CHTA, and others). Guidelines for travelers, hotels and guesthouses, food and beverage industry, conveyances, front line workers, Ports of Entry in the region have also been developed with support from the THP and disseminated to promote a coordinated response. CARPHA THP, CHTA, CTO, and Global Tourism Resilience and Crisis Management Centre (GTRCMC) also established the COVID-19 Caribbean Tourism Task Force to formalize their efforts and harmonized the regional messaging.

CONCLUSION

In conclusion, the ongoing COVID-19 pandemic is causing worldwide disruption. It demonstrates that for new and emerging public threats, it is critical to capture and monitor the variables that drive illness occurrence in real-time, for informing strategies to tackle emerging and re-emerging infectious diseases. This requires a well-coordinated multi-sectoral response. In particular, the dependence of the Caribbean islands on tourism, the high volume of people

traveling to the islands, and the speed of international travel, heightens the public health challenges for the region. The novel regional Tourism and Health Program, through its multi-prong components and multi-sectoral partnerships, is supporting the regional fight against COVID-19. Efforts are already being made to expand this transdisciplinary approach to more countries regionally.

ACKNOWLEDGMENT

The authors would like to acknowledge the IDB for funding the implementation of the THP.

Chapter 88

**WHITE PAPER ON VAPING:
ELECTRONIC CIGARETTES USE –
A CASE FOR RESTRICTIVE POLICIES IN GRENADA,
WEST INDIES**

ABSTRACT

The use of electronic cigarettes (e-cigarettes) or the practice of vaping has emerged as a global public health concern. If this practice remains unchecked, all the gains due to public health efforts to reduce smoking of combustible cigarettes and thus reduce morbidity and mortality from tobacco-related deaths will be reversed. While e-cigarettes were initially introduced as a smoking cessation strategy, sufficient evidence for this has not been forthcoming. In fact, the use of e-cigarettes has produced more negative health outcomes than positive ones, as evidenced in the recent morbidity and mortality related EVALI. While this is more evident in developed countries, governments of low- and middle-income countries such as Grenada, need to protect youth and young adults from initiating and/or continuing use of these potentially harmful products. Many countries, as well as states in the United States, have implemented some level of restrictive policies on

* Corresponding Author's Email: ekeku@sgu.edu.

the use of e-cigarettes based on the available evidence of harm caused by these products. It is proposed that the same interventions that have worked for smoking of combustible cigarettes reduction should be applied to e-cigarettes.

INTRODUCTION

Within the decade, the practice of vaping, including the use of electronic cigarettes (e-cigarettes), has increased globally. Due to its significantly reduced cost per month when compared with regular cigarette smoking, e-cigarettes usage has become increasingly prevalent in high-income countries than in low- and middle-income countries. Vaping or e-cigarettes has been marketed as a strategy for smoking cessation tool. The advertisement strategy claimed that the tapering of nicotine delivery devices is more effective for quitting regular cigarette smoking without concerns about the adverse effects of combustible by-products. Studies have documented and demonstrated nicotine addictiveness through regular cigarette smoking among adults and teenagers.

The evidence of adverse effects of e-cigarettes on health is not clear. In the latter part of 2019, a brand of e-cigarette was linked to lung injuries and deaths among young people as a result of inhaling vitamin E acetate. However, for public health and preventive medicine experts, the concern is evident. Nicotine is highly addictive, and the increased use of nicotine-containing e-cigarettes among teenagers, youths, and adults will lead to greater nicotine dependence. Few studies have reported that vaping solutions and their emissions could contain more than nicotine but also aerosolized products (propylene glycol) and other contaminants which could lead to potential health hazards to e-cigarette users and non-users (passive users). Though using e-cigarette may decrease exposure to the risks associated with conventional cigarette use, the health effects of nicotine and aerosol exposures from e-cigarettes are not at present fully understood. Vaping aerosols and products are dangerous for passive users or non-users in environments with reduced ventilation or to those with disease comorbidities and compromised health conditions. A recently published manuscript (December 2019) in the American Journal of Preventive Medicine reported the first longitudinal analysis of the association between vaping and lung disease.

The research investigators followed e-cigarette users for three years and found that they had a 1.3-times higher risk of developing respiratory disease than people who did not use any tobacco product. Cigarette smokers had a 2.5-times higher risk, and those who both smoked regular cigarettes and vaped had a 3.3-times higher risk of developing respiratory disease [1]. Though the data from this study showed that using e-cigarettes appeared to show the minimal risk of developing respiratory disease, the three years follow-up is not a long time to follow vapers. It's also likely that many people who entered the study as smokers had likely started that habit much earlier, hence allowing risks to accumulate. In terms of the biological effects of e-cigarettes, it's likely that following e-cigarette users for 10 to 20 years will produce similar effects of risks associated with regular cigarettes smoking or worse. In light of this new publication that established an independent risk factor for respiratory disease among e-cigarettes users and dual users (e-cigarettes and regular cigarettes smoking), the latter being the most popular, we are proposing a more aggressive ban of e-cigarettes in Grenada. Further studies are needed to fully establish the adverse effects of e-cigarettes on developing respiratory diseases. Nonetheless, until these studies are available, and since the health

hazards and safety of vaping to users, non-users, and passive users are not completely understood, it is important to ban vaping or e-cigarettes use in Grenada. Grenada is a middle-income country and has no policy on e-cigarettes or vaping usage. The St. George's University is also located in Grenada. Most of the enrolled students are from the United States of America, and the probability of possessing vaping products and the use of e-cigarettes is high among these students. Policies are needed to be developed for the students at St George's University, and other institutions in Grenada. Presently, very few Caribbean countries such as Barbados, Jamaica, and Trinidad have policies that address e-cigarette or vaping. Specifically, in Jamaica, "Nicotine-containing e-cigarettes are classified as medicinal products under the Food and Drugs Act. As such, they must be registered before they can be imported (no approval has been granted for these products to date). The Food and Drugs Act prohibits the sale, distribution, importation, or manufacture of a drug that is not registered with the Ministry of Health. A tobacco control regulation prohibits the use of electronic nicotine delivery systems (ENDS) in public places and on public transportation." In Barbados, the Parliament in Barbados passed legislation on February 2, 2017 to ban smoking and vaping in public areas and to prohibit sales of vaping products to minors. On that date, the Minister of Health, Hon. John Boyce, concluded that the dangers that are associated with e-cigarettes are the same as the with combustible cigarettes. "The Health Service Amendment Bill 2017, which classifies e-cigarettes as electronic smoking devices, extends the prohibition on smoking to e-cigarettes."

In Trinidad and Tobago, "According to Chapter 30:04 #18 (Prohibition on toys or candy cigarettes) [1] No person shall (a) import or manufacture; or (b) sell, display for sale, distribute or supply, any sweets, snacks, toys or other non-tobacco items or objects in the form of tobacco products, or which imitate tobacco products. This act is to regulate tobacco products. Electronic Vaporizers or Electronic Cigarettes that do not contain tobacco or produces smoke." The Chapter 30:04 # 18 to e-cigarettes was designed to stop the importation of toy and candy that resembles traditional cigarettes. This act has resulted in debates and possibly not enforced. Countries that have banned e-cigarettes use include Argentina, Brazil, Brunei, Cambodia, Indonesia, Jordan, Oman, Qatar, Singapore, Taiwan, Thailand, United Arab Emirates, Uruguay, and Venezuela [2]. The experts at St. George's University, School of Medicine, Grenada, West Indies have concerns with the usage of e-cigarettes or vaping and recommends the following proposed solutions for consideration in order to protect the public from the health hazards that are associated with e-cigarettes or vaping in Grenada.

Develop and Add an Amendment to Legislation to Ban Importation, Sale, and Practice of Vaping Associated Products in Grenada

E-cigarette devices and the practice of vaping are relatively new to Grenada and, as such, are not considered under existing legislation to enforce regulation of its use. Vaping products are currently marketed as consumer goods, however, with reference to existing laws; it is an offense to sell nicotine vaping products to young people under age 18. The recommended amendment should include vape devices and e-liquids. The Drug Abuse (Prevention and Control) Act was not designed for vaping and does not include safety standards on what can

be sold. Moreover, flavoring used in vaping products are regulated under respective Food Standards and are not a part of the drug regulatory provisions. Options for consideration are:

- 1) In the absence of any specific legal framework for regulating vaping and its products, the government should draft and legislate vaping-specific laws and regulations as an amendment to existing legislation.
- 2) Primary and secondary schools, higher-educational institutions, and individual businesses can make their own policies and rules around vaping that include penalties such as fines for first and second violations and dismissal with persistent or chronic violations.

Establish Health Education and Promotion against Vaping as a Practice and Substances Used for Vaping

Health education and promotion efforts against vaping are a component towards prevention and control, which will complement a legislative agenda to include vaping within existing laws. Education and promotion campaign should focus on e-cigarettes/vapes and combustible cigarettes. Awareness campaigns should be designed to reach youth directly through a variety of channels:

- a) Online and social media advertisements on platforms popular with youth (e.g., Snapchat, Spotify, Instagram).
- b) Web page and Instagram account where youth can seek more information and resources.
- c) Through organizations such as schools and community-based organizations with posters, fact clings, and a handout.

Establish Policy and Legal Interventions against Vaping at Primary and Secondary Schools, Higher Educational Institutions, and Individual Businesses in Grenada. Review and Strengthen Current School Health Policy, Which Relates to Tobacco and Cigarette Smoking to Include Vaping. Themes to Include Are

- a) Educate: E-cigarettes and other vaping products are often not easily recognizable. Educating staff about these products and about the school's policy to address them is an important part of a strategy to reduce student use.
- b) Know more about vaping use: Collecting data on types of vaping products students are using and where they obtain vaping products can help inform education efforts and decisions about school health policies. Sample surveillance questions about vaping use, as well as questions about how students obtain vaping products, perceptions of harm, locations of use, are included.
- c) Share resources for quitting vaping: While the use of vaping on school grounds is not regulated, that doesn't mean they are not current vaping users. It is important to

support persons who use vaping products by providing them resources to address their own nicotine addiction.

- d) Know more about resources in your community: Work with student groups to provide support, education, and connections to resources to address issues of vaping use in their community.

ELECTRONIC CIGARETTES

The use of electronic cigarettes (e-cigarettes), also known as electronic nicotine delivery systems (ENDS) or the practice of vaping has emerged as a global public health concern. While this is more evident in developed countries, governments of low- and middle-income countries such as Grenada, need to protect youth and young adults from initiating and/or continuing use of these potentially harmful products. The US Surgeon General landmark report of 1964 linked smoking cigarettes to the development of lung cancer and heart disease. Following this report, a number of interventions, targeting the advertising, sale, and use of cigarettes, were successfully implemented and proven to be effective in reducing smoking rates [3]. However, the use of e-cigarettes, which was introduced as a potential cessation device and an alternative cigarette product, is threatening to reverse the successes of these interventions. To prevent this from occurring, governments need to take preventive measures. The most effective strategies involve examining best practices and evidence-based solutions that can be tailored to the local context and implemented. In this paper, we present evidence to make a case for the prohibition of some sort and/or restrictive policies in Grenada.

THE E-CIGARETTE DEVICE: BASIC STRUCTURE

Vaping is the practice of inhaling heated and aerosolized constituents of e-cigarettes liquids. The design of e-cigarette devices has changed over time. The change in size, shape, and style has evolved into an efficient nicotine delivery machinery capable of delivering greater concentration and volume of nicotine than older versions. The documented versions of these nicotine delivery devices are delineated into four generations [4].

Figure 1. Basic components of closed and open e-cigarettes, adapted from, Electronic cigarettes: what are they and what do they do? [5].

Common to these designs through all the generations is a battery, liquid that can be turned into vapor, an electrical heating system, and a tank (which serves as a reservoir for the liquid). These innovations are generally classified into two categories; open and closed. The open system is designed such that the components can be replaced; also, it has a system that serves as liquid storage (tank). The closed type has a less flexible design, devoid of the tank, and doesn't offer the option for part replacement. A classical representation of these designs is illustrated in Figure 1 below, showing the various essential components of an e-cigarette [5].

THE E-CIGARETTE DEVICE: HOW IT WORKS

E-cigarette devices comprise of a battery, a reservoir for holding a solution that usually contains nicotine, a heating element or a vaporizer, and a mouthpiece through which the user puffs. The user puffs on it but does not light it, and it does not produce smoke. The solution, which typically uses glycol or glycerine as a solvent for the nicotine and flavoring chemicals, is heated into an aerosol that is inhaled by the user [6]. The solution can also contain other harmful products such as volatile organic compounds (VOCs), nicotine, carcinogens, heavy metals, flavorings such as diacetyl; a chemical linked to a serious lung disease, and ultrafine particles that can be inhaled deeply into the lungs. Nicotine is highly addictive, toxic to the developing fetus, and harms brain development of adolescents. Peripartum, fetal, and developmental adverse effects of nicotine are well documented [7, 8].

The increased use of e-cigarette by female adolescents and women of childbearing age also raises concerns about the effects of e-cigarette during pregnancy and the safety of the fetus. Pregnant traditional smokers are making a switch to vaping because of the perceived lower risk noncombustible cigarette offers [9]. Bystanders can also breathe in this aerosol when the user exhales into the air, causing irritation of the upper airways and eyes and effects from nicotine, including palpitations and an increase of the systolic blood pressure [10]. As e-cigarettes have increased in popularity, their designs, due to a lack of standardization, have also become more diverse [11]. They come in many different shapes and sizes, resembling regular cigarettes, cigars, or pipes, pens, USB sticks, and other everyday items. The larger devices such as tank systems, or "mods," do not resemble other tobacco products [4]. The implications of these new delivery devices are that the level of nicotine and other chemicals inhaled by the user varies, thereby increasing the potential risk to the user. Moreover, there is the potential for e-cigarette devices to be used as illicit drug use delivery systems. Evidence shows e-cigarettes have been used to vape substances such as cannabis, methylenedioxy-methamphetamines, synthetic cannabinoids, methamphetamines, cocaine, heroin, and fentanyl [12]. The first device of what is currently used today was developed by Lik Hon, a Chinese pharmacist [13], and the original design has since evolved into the variety of e-cigarette devices that currently exist. This novelty was introduced into the Chinese market in 2004 and used as a potential cessation device or an alternative cigarette product [14]. The product was later introduced into the US market in the mid-2000s and quickly expanded into a variety of brands and flavors. The practice of vaping was promoted to assist smokers in quitting as it aimed to reduce and/or eliminate smoking withdrawal symptoms and cravings [15]. However, few robust studies have found e-cigarette use to be more effective than other traditional strategies. A recent Randomized Control Trial, which examined the effectiveness

of e-cigarettes versus nicotine replacement therapy as a smoking cessation strategy, found e-cigarettes to be more effective when accompanied by behavioral support [16]. On the other hand, evidence in support of the effectiveness of this intervention is inconclusive, as noted in several systematic reviews [17]. What has been found is that e-cigarettes reduce harm, in that exposure to poisonous and carcinogenic substances present in combustible cigarettes are reduced, thereby reducing adverse health outcomes. Nevertheless, while intended to be less harmful, the use of e-cigarettes has produced numerous biological effects resulting in injury and death. More rigorous studies are therefore needed to determine the effectiveness of e-cigarettes on harm reduction and quitting behavior. Furthermore, a study that compared the effect of co-use of traditional cigarettes with e-cigarette observed a quadruple increase in cigarette smoking compared to individuals who only smoked traditional cigarettes [18]. This result alludes to the body of academic evidence that questions the beneficial effect of vaping as an alternative to traditional smoking.

The recent trend in increasing prevalence, globally, is a cause for concern because there are reasons to believe that the public health gain from a decline in smoking tobacco could be reversed with the alarming rate of use of e-cigarette. In 2019, the prevalence of self-reported current e-cigarette use was high among US high school and middle school students, at 27.5% and 10.5%, respectively [19]. During 2017–2018, current e-cigarette use increased by 78% among high school students (from 11.7% to 20.8%), in 2011, it was 1.5%. Among middle school students, current e-cigarette use increased from 0.6% in 2011 (60,000 students) to 4.9% (570,000 students) in 2018 [20]. This increase in prevalence is also observed globally. In Canada, it was observed that 15.4% (4.6 million) reported the use of an e-cigarette. In 2017, 14.6 million Canadians who are 15 years and older had tried an e-cigarette, which translated to an appreciable increase from about 13% (3.9 million) in 2015 [21]. Among Korean youth use of e-cigarettes increased from 0.5% in 2008 to 9.4% in 2011 [22]; while in England among youth, the use of e-cigarette increased from 22% in 2014 to 25% in 2016 [23]. In Trinidad, in a study among young adults 18–40, the prevalence was 24.6%, and of that, 16.9% had never smoked tobacco [24]. These trends are worrisome, and use has recently been linked to deaths in the US. According to the US Centres for Disease Control and Prevention (CDC), as of November 20, 2019, 2,290 cases of electronic cigarettes, or vaping, product use-associated lung injury (EVALI) has been reported, including 47 deaths. Vitamin E acetate, an additive in some tetrahydrocannabinol (THC) containing products, was found in all analyzed bronchoalveolar lavage (BAL) fluid samples of patients. THC is the psychoactive mind-altering compound of marijuana that produces the "high." However, it is unclear whether other chemicals are also causing the lung injury and, for this reason, the CDC has advised persons to refrain from the use of all e-cigarettes or vaping products [25, 26]. Among youth and young adults, the use of e-cigarettes has also been shown to increase the likelihood of smoking combustible-cigarettes [27]. Some researchers believe that the unabated acceptance of vaping further perpetuates smoking habit and could serve as a portal for some tobacco naïve adolescents.

Furthermore, while the association of e-cigarette use and long-term health effects are unclear, evidence shows that e-cigarette use increases heart rate, increases cough and wheeze in adolescents, can induce acute endothelial dysfunction and oxidative stress of tissues. Potential pathological effects of vaping also include the development of pulmonary diseases such as COPD, cardiovascular diseases, neurodegenerative disorders such as Alzheimer's disease and cancer [28, 29]. More importantly, use of e-cigarettes can increase the number of

youth and young adults who are exposed to nicotine, increase the likelihood that former smokers will again become addicted to nicotine, encourage non-smokers to start smoking conventional cigarettes and other burned tobacco products and sustain nicotine addiction instead of quitting completely [30, 31].

While there is no data on e-cigarette use among youth and young adults in Grenada, a survey conducted among secondary school students in 2013 showed that the prevalence of lifetime use of combustible cigarettes is high, although it decreased from 37% in 2005 and 2007 to 27% in 2013. Overall, there was also a decrease in the prevalence of past-year use and current use of combustible cigarettes [32]. With access to e-cigarettes, these statistics can quickly be reversed.

DETERMINANTS/CONTRIBUTING FACTORS AND CHALLENGES

The use of e-cigarettes has been viewed by many users as a safe alternative to the use of combustible cigarettes. With a few brands being advertised as nicotine-free, consumers may regard e-cigarette use as a safe practice and one that may even contribute to lower nicotine craving. E-cigarettes are popularly used in many countries, including the US, UK, and Canada. The majority of e-cigarettes, however, contain nicotine [33] and, without making a deliberate choice to select non-nicotine products, the substance and its by-products are consumed by users, unawares. To date, the USFDA has not issued any advisory endorsing e-cigarettes as a quit aid.

Consumers may also fail to understand other risks associated with the use of e-cigarettes. In addition to nicotine, e-cigarettes also contain carcinogenic metals, such as cadmium, chromium, lead, manganese, and nickel that are added to e-liquids [34]. Although considered safer than combustible cigarettes [35], within the last five years, the evidence has also been mounting from research and epidemiological surveillance on the health effects of solvents, flavorants, and toxicants used in e-liquids. Compared to combustible cigarette, e-cigarette affords a more discrete use, and there is less disapproval of its use by the wider public. Although the electronic nicotine delivery systems (ENDS) are perceived and marketed as a safer alternative to traditional tobacco smoking; the anti-tobacco campaigns have largely succeeded in creating awareness about the dangers of second-hand smoke for bystanders from the use of combustible cigarettes. A similar second-hand smoke effect occurs among bystanders in close proximity to e-cigarette users. Increased levels of nicotine, tobacco-specific nitrosamines (TSNAs), propylene glycol, and copper were found in the exhaled breath of bystanders in a study, mediated by ventilation, size of the room, and behavior of the user [36]. When heated, the volatile particulates in e-cigarettes are quickly dispersed in the air, exposing non-users to the toxic chemicals.

Age

The teenage years are important for brain development, which continues into adulthood. At that stage, young people are also most susceptible to addictions and organ damage from drug use [37]. This stage of development is usually characterized by risky behaviors that

provide a sense of maturity and social acceptance for youth. Little regard is given for the implications of exposure to hazardous substances, such as drugs and alcohol, on future physical and mental health. E-cigarettes are popularly used by young people in the United States; a trend that signifies the potential for steady increase in the number of new users [38]. Between 2014-2018, e-cigarette use increased 160% among youth in the US [39]. The United States Surgeon General has continually warned of the use of tobacco products and other drugs during youth and young adulthood, which leads to habitual use in adulthood [40]. The copycat mentality perceived among young people in Caribbean countries towards the trends in the United States, in particular, favors an introduction and increase in the use of e-cigarettes in Grenada.

Apart from peer pressure, availability of the devices, alluring advertisements, attractive flavors, and the perception of a safe alternative appeal to young people. E-cigarette marketing projects vaping as glamorous and enchanting; this advertising style downplays and disguises the lethal effects of vaping to unwary teenagers and adolescents. The products and messages are packaged to appeal to the younger population as a harmless alternative method of recreation. The goal is to normalize the lifestyle of alternative nicotine consumption among teenagers and adolescents. Statistics show that there has been some degree of successes recorded by the vaping marketing industries, evident by the teeming and surging numbers of teenagers adopting vaping as a form of nicotine intake. Regulation of this industry has been described as a major part of several national strategies aimed at reducing the level of exposure of younger populations to these marketing strategies [41].

The perceived absence of stigmatization typically associated with the use of combustible smoking products may serve as an encouragement for the use of e-cigarettes. Nicotine is highly addictive and causes a plethora of problems in young people, including problems with cognition and attention, reduced impulse control, mood disorders, and physical damage to the brain and lungs [40]. These effects can contribute to a significant increase in morbidity and mortality in the youth and early adult population. With the emergence of concrete evidence of the dangers of smoking, public health agencies have ramped up campaigns against the practice over the years and were successful in securing support for banning or restricting the use of tobacco products in several countries. The Government of Grenada and governments and other small island states should consider the epidemiological and financial burdens that may emerge should e-cigarette use become widespread in these countries. Huge social and economic burdens may also be placed on young people, their families, and the wider Grenadian community to address any emerging epidemic related to the use of e-cigarettes. This burden will also extend to the state level, as the health care system in small island states quickly become stretched when confronted with new challenges.

Social Norms

The social acceptance of e-cigarette compared to combustible cigarette is discussed above. E-cigarette use is likely to be more popular among people who reside in communities and/or households where the practice is also acceptable. Young people usually obtain the devices from family members and friends [38]. In a study in four states in the US, young people reported that their families were aware of their use of e-cigarettes, and they also received positive messages about the use of the devices [38]. The media has also publicized

celebrities using e-cigarettes. Not only is the practice acceptable in many societies, but provisions are also made for smoking and e-cigarette use in highly patronized areas, such as in airports, universities (schools), and restaurants. Such provisions may project the impression that smoking and e-cigarettes use is “normal,” although confined to designated spaces. In August 2016, the FDA issued a Final Rule to regulate the manufacture and sale of e-cigarette in the US [42] and, by 2019, 98 countries had national or federal laws regulating manufacture, sale, and use of e-cigarettes [43]. Currently, there is no move towards prohibiting the importation and sale of e-cigarettes in Grenada. In order to follow the course of countries that have banned or prohibited the use of e-cigarettes to protect public health, the legal and policy provisions in Grenada need to be revised. The narrow focus of several laws and policies also need to be addressed to put Grenada in a more opportune position to respond to the new products that are constantly available on the market.

Cost and Availability

High taxation has been used as a mechanism to control the purchase and use of combustible cigarettes. In most cases, e-cigarettes do not attract the same high taxes that may deter sale. The Ministry of Health in Grenada has not produced any documentation on the local sale of the device and accessories nor the extent to which those are used on the island, although there are observations of e-cigarettes being used by tourists, international students, and other visitors. There may soon be a market in Grenada for the devices and refills. Should the products become available in markets in Grenada, other residents will also have access. Applying the precautionary principle or prevention measures may be most prudent and relevant to protect the health of Grenadians.

Other Drug Use

Recently, the CDC reported that some brands of e-cigarettes also contain the marijuana compound tetrahydrocannabinol (THC) [44], which is one of the main chemicals that produce physical effects when the leaves and other parts of the plant are used in smoking. Marijuana use and sale are illegal in Grenada. The use of e-cigarette, however, remains a legal and easy way to access and consume THC. In Canada, a study found that e-cigarette use was significantly associated with marijuana use among young people [45]. Another study in the US found that adults who used both marijuana and alcohol had increased odds of e-cigarette use [46]. The CDC also found that almost 90% of patients in two states in the US who developed lung injury reported they used vaping products with THC within three months before the study [44].

The CDC warned consumers of fake THC used in some e-cigarette brands and which also heighten the risk for damage to the lungs and other organs [44]. The study in 2013 among students in secondary schools in Grenada indicated that a relatively high number of young people had smoked combustible cigarette or marijuana in their lifetime and/or used alcohol [20]. Alcohol and marijuana can be gateway drugs to the use of e-cigarettes [46]. In another study, the reverse trend was also found; e-cigarette use was associated with subsequent use of

other drugs [33, 47]. Young people may experience several years of healthy life lost and high social and economic burdens associated with chronic diseases from the use of e-cigarettes. Similar to the situation in the US during the opium crisis, the health care system in Grenada may also become stretched to deal with a new challenge.

PROPOSED SOLUTIONS

The same interventions that have worked for youth smoking reduction are recommended to be applied to e-cigarettes. The approach, therefore, should be multipronged. In the US, seven states have taken action to ban or restrict the use of e-cigarettes [48]. According to a recent WHO survey, the sale of ENDS with nicotine is banned in 13 of 59 countries in which there are regulations. However, the majority of the 13 report availability of ENDS through illicit trade and cross border internet sales [49]. The WHO, therefore, advises countries to consider the following when designing a regulatory strategy for ENDS (a) impede ENDS promotion to and uptake by non-smokers, pregnant women, and youth; (b) minimize potential health risks to ENDS users and non-users; (c) prohibit unproven health claims from being made about ENDS; and (d) protect existing tobacco-control efforts from commercial and other vested interests of the tobacco industry [49]. Based on the WHO guidelines, the following are recommendations for Grenada:

Amendment to Legislation to Regulate Importation and Sale Practice of Vaping Associated Products

The recommendation is for vaping and its tobacco-based products to be listed for regulation under the Drug Abuse (Prevention and Control) Act No. 7 of 1992, Amended, January 2002, Amended by SRO 16 of 2011. E-cigarette devices and the practice of vaping are relatively new to Grenada and, as such, are not considered under existing legislation to enforce regulation of its use. Vaping products are currently marketed as consumer goods, however, with reference to existing laws; it is an offense to sell nicotine vaping products to young people under age 18. There are no legal restrictions on where people can vape, although the Drug Abuse Act which makes provisions for the demarcation of smoking free spaces. The recommended amendment should include vape devices and e-liquids to be regulated under respective and comparable laws.

The Drug Abuse (Prevention and Control) Act was not designed for vaping and does not include safety standards on what can be sold. Moreover, flavorings used in vaping products are regulated under respective Food Standards and are not a part of the drug regulatory provisions. Options for consideration are:

- 1) In the absence of any specific legal framework for regulating vaping and its products, the government should draft and legislate vaping-specific laws and regulations as an amendment to existing legislation.

- 2) Institutions and individual businesses can also make their own policies and rules around vaping, which is the only current measure for them to decide where persons can vape.

Any proposed legislative and policy initiatives should consider the following:

- a) Provide protection from environmental (second-hand) smoke and vapor by prohibiting smoking and vaping of tobacco, nicotine or related products except in the established outdoor designated smoking areas and prohibiting all smoking and vaping;
- b) Foster health and wellness by restricting the consumption, promotion, advertising and sale of smoking and vaping related products;
- c) Recognize the permitted burning of traditional medicines during Traditional Aboriginal Ceremonies;
- d) Communicate restrictions on smoking, vaping, and use of tobacco, nicotine, and cannabis.

Health Education and Promotion against Vaping as a Practice and Substances Used for Vaping

Health education and promotion efforts against vaping is another component towards prevention and control, which will complement a legislative agenda to include vaping within existing laws. Education and Promotion campaign should focus on e-cigarettes/vapes and combustible cigarettes. These are different products that pose the same dangers. A public information campaign to raise awareness among school-aged youth about the dangers of e-cigarettes/vapes is critical towards informing healthy behaviors. Reference is made to a campaign by the CDC as resources available to schools and community-based organizations, and ideas for utilizing the resources [50, 51]. Awareness campaigns should be designed to reach youth directly through a variety of channels:

- a) Online and social media advertisements on platforms popular with youth (e.g., Snapchat, Spotify, Instagram).
- b) Web page and Instagram account where youth can seek more information and resources.
- c) Through organizations such as schools and community-based organizations with posters, fact clings, and a handout.

The CDC recommends use of organizational resources for these campaigns. Some examples include:

- a) Reinforce adult education about the topic. The youth campaign and materials are a great way to reinforce educating parents/guardians and staff in organizations about e-cigarettes. Adults may not be up to date with information regarding vaping and should be considered for a presentation with basic information about e-cigarettes.

- b) Hang campaign posters. The Vapes and Cigarettes: Different Products. Same Dangers posters were created to deliver messaging to youth. Consider hanging them throughout schools where they are visible. Ideas for placement include bathrooms, locker rooms, classrooms, counselor's office, nurse's office, coach's office, bulletin boards, hallways, lunchroom walls, concession stands at school events, and meeting rooms.
- c) Hang fact clings. Each of the four main facts on the campaign poster is printed as small "clings" that adhere to windows, mirrors, doors, and other surfaces. Because young people reported during the campaign focus groups that school bathrooms are often a favored vaping location, the clings were developed with school bathrooms in mind—but they can be used in other areas of the organization's building as well.
- d) Distribute the campaign handout. A two-sided handout or fact sheet contains more facts about the dangers of vaping/using e-cigarettes. The handout expands upon the four main facts in the poster and fact clings and provides resources for youth.

Examples of Schools Based Awareness Campaigns include CATCH My Breath program. CATCH (Coordinated Approach to Child Health) is a school-based initiative which uses relevant, youth-friendly lesson plans. CATCH a youth e-cigarette prevention program targeting ages 11-18. The program uses a Tobacco Prevention Toolkit for teachers with in-classroom units and lesson plans on e-cigarettes, tobacco, and nicotine. The toolkit includes PowerPoints, discussion guides, worksheets, and activities. ASPIRE is also a free, bilingual, online tool that helps middle and high school teens learn about being tobacco-free, and smokescreen is a Smoking Prevention Videogame – play2PREVENT [52, 53].

Policy and Legal Interventions against Vaping

Review and strengthen current school health policy which relates to tobacco and cigarette smoking to include vaping. Themes to include are:

- a) Educate: E-cigarettes and other vaping products are often not easily recognizable. Educating staff about these products and about the school's policy to address them is an important part of the strategy to reduce student use.
- b) Know more about vaping use: Collecting data on types of vaping products students are using and where they obtain vaping products can help inform education efforts and decisions about school health policies. Sample surveillance questions about vaping use, as well as questions about how students obtain vaping products, perceptions of harm, locations of use, are included.
- c) Share resources for quitting vaping: While the use of vaping on school grounds is not regulated, that doesn't mean they are not current vaping users. It is important to support persons who use vaping products by providing them resources to address their own nicotine addiction.
- d) Know more about resources in your community: Work with student groups to provide support, education, and connections to resources to address issues of vaping use in their community.

BENEFITS

Support for smoke and tobacco-free policies in public spaces continue to be implemented over the last several years as the benefits of preventing second-hand smoke and reducing primary use of cigarettes is well documented. The advent of vaping and its associated adverse health effects have also led to current efforts to support policies that prohibit vaping in public spaces. Additionally, the numbers of higher education institutions with comprehensive smoke or tobacco-free policies are now extending their regulations towards vaping in an effort to prevent the adverse effects of vaping. Working to prevent vaping use among youth is especially important because 99 percent of vaping use starts at a young age. Similarly, citizen groups and professional organizations of healthcare providers have started advocating for the adoption of prohibiting vaping practices and vaping products out of an abundance of precaution towards preventing the established burdens associated with vaping exposure. Four particular benefits of prohibiting vaping practice and products for Grenada are:

Decline in Use

The lessons learned from the increase in smoke and tobacco-free policies have led to a decline in the number of persons who smoke cigarettes. Data describing the downward trends in cigarette use was also reported for other tobacco products, including e-cigarettes, hookah, little cigars, and traditional cigars. The expectation is for the practice of vaping to also be reduced through the implementation of policing prohibiting vaping together with an anti-vaping campaign.

Health Promotion

Additional benefits are also derived besides helping to reduce vaping use through education. Changing attitudes towards other substance use and eliminating second-hand exposure make it easier for users to quit. From a health behavior and health promotion perspective, a vaping free policy presents opportunities to educate persons about other health-related issues and the benefits of a health-seeking lifestyle.

Clean Environment

A policy prohibiting vaping will benefit the environment through reduced emission in the air, reduced litter, and reduction in the risk of fire. The policy on vaping prohibition will also reduce maintenance costs associated with cleaning and restoring spaces affected by vaping use and litter.

Professional Preparation

Policies aimed at reducing practices such as vaping also prepare persons to be functional for the workforce and other professional settings. An increasing number of worksites are prohibiting tobacco and other substance use, including through vaping. Smokers/vapers have a harder time getting hired and the chances of getting a job are reduced for unemployed job seekers who smoke/vape.

Reduced Healthcare Cost from Managing Adverse Health Effects

In 2019, vaping has become a public health priority after accidents of sudden lung diseases reported in the US and UK. Active research is currently underway to find out more negative side effects of vaping, but it will be a while before results are available. Vaping side effects can be from short-term, minor issues to something so severe affecting multiple organ systems in the body. From a cost perspective, per capita, health care costs for smokers are higher than those of non-smokers. For example, smoking is the largest single cause of preventable illness and premature death within the UK and places a significant financial burden each year. When applied to projected costs associated with vaping, the scale of use and effects is not comparable, but the cost of treating effects is considerable and increasing. The financial impact of vaping, like smoking, extends to businesses and its workforce productivity; smoking/vaping breaks are said to cost billions of dollars per year, and increased absenteeism is estimated in the billions. There is also a reduced life expectancy and decreasing the country's workforce and its productivity.

CONCLUSION

The use of electronic cigarettes (e-cigarettes) or the practice of vaping has emerged as a global public health concern. If this practice remains unchecked, all the gains due to public health efforts to reduce smoking of combustible cigarettes and thus reduce morbidity and mortality from tobacco-related deaths will be reversed. While e-cigarettes were initially introduced as a smoking cessation strategy, sufficient evidence for this has not been forthcoming. In fact, the use of e-cigarettes has produced more negative health outcomes than positive ones, as evidenced in the recent morbidity and mortality related EVALI. While this is more evident in developed countries, governments of low- and middle-income countries such as Grenada, need to protect youth and young adults from initiating and/or continuing use of these potentially harmful products. Many countries, as well as states in the US, have implemented some level of restrictive policies on the use of e-cigarettes based on the available evidence of harm caused by these products. It is proposed that the same interventions that have worked for smoking of combustible cigarettes reduction should be applied to e-cigarettes. With the reported high prevalence of conventional cigarette smoking among secondary school students in Grenada, the recommendation is for vaping and its tobacco-based products to be listed for regulation under the Drug Abuse (Prevention and Control) Act No. 7 of 1992, Amended, January 2002, Amended by SRO 16 of 2011. Health

education and promotion against vaping is another component of the effort towards prevention and control, which will complement a legislative agenda to include vaping within existing laws. Also, there should be a review and strengthening of current school health policies that relate to tobacco and cigarette smoking to include vaping. Benefits of prohibiting vaping practice and products for Grenada are health promotion with a decline in the use and associated reduction in healthcare costs, cleaner environment and promoting health seeking behavior, and professional conduct among youth and young adults.

Chapter 89

PROTECTING HEALTH SECURITY IN THE CARIBBEAN: A COORDINATED REGIONAL RESPONSE TO THE NOVEL CORONAVIRUS DISEASE (COVID-19) AND OTHER GLOBAL PUBLIC HEALTH THREATS

ABSTRACT

Small island developing states like those of the Caribbean Region need strong Regional Coordination of Health Security to mitigate the impact of emerging and re-emerging infectious diseases. The importance of countries working together to achieve functional cooperation and ensure a strong emphasis is placed on Regional Health Security is especially evident with the Caribbean's response to the pandemic of novel coronavirus disease (COVID-19). The aim of this chapter is to describe health security in the Caribbean region and how this has been addressed in the context of a coordinated regional response to the coronavirus disease epidemic. The Caribbean Community (CARICOM) Member States were among the last countries in the world to see an introduction of the COVID-19 infection. The health security efforts of multiple CARICOM regional institutions and stakeholders saw a level of coordination to achieve increased vigilance, early detection of importation of the novel coronavirus and the provision of additional critical care resources to deal with the rapid increase of illness which has come to characterize the progression of disease in affected countries around the world. While it is still early days in the COVID-19 pandemic, the Regional Coordinating Mechanism for Health Security has continued to be the mechanism by

which CARPHA has gained agreement on policy and operational issues among the multiple stakeholders determining a more cohesive and transparent method for Health Sector action in CARICOM.

INTRODUCTION

The Caribbean consists of many small island developing states, which makes them extremely vulnerable to public health emergencies and disasters (hurricanes, floods, earthquakes). This is due to several factors, including variability in their capacity to respond to public health threats, geographical vulnerabilities to disasters, limited resources for health sector response and surge (human, financial, infrastructural), capacity. Traditionally the CARICOM Member States have individually only been able to respond to a moderate degree of threat. The porous borders and interconnectedness of countries through travel and trade further increases the risk from health threats [1]. The Caribbean also boasts one of the highest numbers of travelers per population worldwide. However, whilst tourism is the key economic driver for the region and is adversely impacted by emergencies and disasters, the high number of travelers per population increases the health, safety, and security risks to the local populations. This has been evident through the introduction and spread of several new and re-emerging diseases [2], as exemplified by outbreaks of Norovirus, H1N1, Chikungunya, Zika, and the current novel coronavirus (COVID-19).

Over the past five years, the Caribbean region has been negatively impacted by repeated outbreaks of new and emerging infectious diseases that have tested the regional health security capacity. The emergence of mosquito-borne diseases Chikungunya and Zika [3]; H1N1, and the preparedness for the possible introduction of Ebola are more recent events that have required the building of internal and regional capacity for emergency response and have highlighted the need for boosting regional health security. The Caribbean has been impacted by multiple hurricanes over the past years. In 2017, Hurricanes Irma and Maria devastated several of the Member States. According to one report, Hurricane Irma's impact from insured losses was estimated at around \$2 billion in 2019 [4]. The collective experiences gained across multiple sectors from many years of preparing for responding to public health emergencies and natural disasters have contributed to building resilience and adaptive capacity of the Caribbean people to the impacts of disasters.

Public health emergencies and disasters have the potential to adversely affect the health of the population. Hence public health systems must play an integral role in preparing communities to respond to and recover from hazard impacts. The public health consequences of disasters and emergencies can be far reaching. During the initial response, the people and communities that are impacted must rely on local community resources and then on external support. As a result, all local, national and regional emergency response stakeholders must be prepared to coordinate, cooperate, and collaborate with cross-sectoral partners and organizations at all governmental levels when emergencies occur, regardless of the type, scale, or severity.

The novel coronavirus disease outbreak in late 2019/early 2020 occurred following recent outbreaks, including Chikungunya and Zika, in multiple countries across the Caribbean region. Outbreak preparedness activities, as well as activities aimed at building core

capacities for the IHR (2005) by health sector stakeholders, should have provided the foundation to build regional cooperation to any new and emerging health threat.

The COVID-19 pandemic initially created international anxiety because of its novelty, coupled with extensive media coverage, and a plethora of fake news and misinformation. The ease of modern-day global travel meant that people from the original and subsequent epicenters traveled freely to several parts of the globe. The importance of travel in the movement of infected people from one geographical area to the other has been evident in the current COVID-19 pandemic. The heightened risk of importation of cases facilitated by tourism travel has been an important consideration for the island nations and the regional governance mechanisms of the Caribbean.

Some of the health issues observed in the region, including a combination of the increased burden of non-communicable diseases (NCDs), and injuries, new, emerging and endemic infectious diseases, and an aging population, will increase the vulnerability of populations and health systems in Member States [4, 5]. A significant proportion of Caribbean people have underlying health conditions that place them in the high-risk categories for severe outcomes from COVID-19. Health security measures must consider the NCD issues and prepare to mitigate the risk to the most vulnerable population.

The Caribbean Community (CARICOM), the regional body for governance, has established various institutions and mechanisms in partnership with regional stakeholders and international development partners to safeguard the health security of the region. The Caribbean Public Health Agency (CARPHA) as the sole regional public health agency, is leading the regional health response to COVID-19, in keeping with its Intergovernmental Agreement (IGA) mandate from Heads of CARICOM Government and recommendations from Council for Human and Social Development (COHSOD) - Health working group on regional coordination for the management of COVID-19.

The aim of this chapter is to describe the health security situation in the Caribbean region and how the Security Cluster of CARICOM has been mobilized to provide the foundation of a coordinated regional response to the Pandemic of COVID-19 disease. The paper also highlights the leading role of the CARPHA, in the CARICOM regional health response to COVID-19 and the importance of strong partnerships with non-Health sectors in achieving functional cooperation for regional health security.

HEALTH SECURITY IN THE CARIBBEAN

The World Health Organization defines global public health security [6] as the activities required to minimize the danger and impact of acute public health events that endanger the collective health of populations living across geographical regions and international boundaries. The goal of global public health security is to demonstrate how collective international public health action can build a safer future for humanity. Many of the lessons learned from the West African Ebola Outbreak have catalyzed actions that have enabled faster and more effective response to outbreaks and emergencies [7]. The Health Security Interface is the point where two systems - the public health sector and the security sector meet and interact in a variety of situations. Some examples where the health security interface occurs are: outbreak response operations in non-permissive environments, such as highly

politicized contexts, conflicts, and wars; deliberate events, including the intentional use of chemical or biological agents in order to cause harm; Issues related to mass gatherings, such as major sporting events, festivals, and regular religious migrations; and activities that may arise in the course of a natural disease outbreak.

The interconnectedness of the globe is now facilitated by the ease of travel from one end to the other by aircraft, and infectious disease threats can now spread much faster across geographical regions. The travel industry is vulnerable to public health emergencies and, in the context of the COVID-19 outbreak, the impact on travel is well noted. The updated and expanded International Health Regulations (2005) provides the legislative framework to enable international collaboration for public health emergencies of international concern. It also facilitates the mobilization of essential resources for effective and timely implementation of actions and, at the country level, requires national core capacity in disease detection. In the last five years up to 2017, WHO reported that more than 1100 epidemic events were verified worldwide; 48 of these in the region of the Americas [8]. Securing the health of the Caribbean surpasses keeping residents safe but extends to the millions of tourists and other visitors that travel to the Caribbean region each year. Implementing systems to eliminate, prevent, and control the spread of infectious diseases is essential for regional health security.

Regional Health Security in the Caribbean describes the capacities required for CARICOM Member States to prepare for and respond to public health threats, issues, and concerns that transcend national boundaries and potentially impact on economic and political stability, trade, tourism, and access to goods. The Caribbean region has a long history of cooperation for health, evidenced by the establishment of various regional organizations from as far back as the 1940s [9, 10]. While multiple efforts have targeted health security over the years, various activities have been carried out in the region in the last six years as part of efforts to bolster regional capacity and coordinated regional response.

The Caribbean Public Health Agency (CARPHA), is the sole public health agency of the Caribbean and commenced operations on Jan 1, 2013, with the aim of delivering the functions of five previous regional health institutions (Caribbean Epidemiology Centre, Caribbean Environmental Health Institute, Caribbean Food and Nutrition Institute, Caribbean Health Research Council, and Caribbean Regional Drug Testing Laboratory) through one platform for greater synergy and cost-effectiveness and as the principal institutional expression of the Caribbean Cooperation in Health [11]. CARPHA provides public health surveillance, emergency response, laboratory, information, research, training, and policy development services that benefit a diverse population of 17 million people in 26 English, French, Spanish and Dutch-speaking member states and territories.

As the regional public health agency, CARPHA plays a pivotal role in defining the scope of health risks associated with many emergencies, including those associated with the natural occurrence of highly infectious diseases, such as COVID-19. In health emergencies, CARPHA serves as a key leader in the regional health response, working closely with other regional and international agencies, to design protective strategies, to instruct health professionals about preventive or treatment interventions and to provide guidelines and technical input to inform the health sector and mechanisms involved in the health security interface. Mechanisms at CARPHA for supporting and coordinating regional health security include:

- CARPHA's Medical Microbiology Laboratory (CMML) which includes a biosecurity level 3 (BSL 3), that serves as the CARICOM regional reference laboratory.
- Health Information, Communicable Diseases and Emergency Response (HCE) Unit, well equipped with qualified epidemiologists, and other technical experts experienced in addressing public health emergency and response.
- Incident Management Team: multi-skilled team consisting of experienced scientists ranging from epidemiologists, laboratorians, risk communicators, behavioral scientists, non-communicable diseases, and other public health experts. This team is activated, once an emergency is verified, to provide real-time daily response to CARPHA member states.
- Regional travelers/tourism and health program (THP) that addresses health, safety, and environmental issues impacting on tourism through an integrated approach and works closely with regional and international tourism sector partners for health security. This unique program adopts a multiprong (surveillance, guidelines, standards, capacity building, policy) and multisectoral (partnerships with CLIA, WTO, VSP Travelers Health: PHE, CDC, PHAC, WHO) approach for implementation and endorsement from Ministers of Health and Tourism across the region. The THP provides a real-time Early Warning and Response Travel Health Information Monitoring (THiS; website <http://this.carpha.org>) that can serve as a proactive measure to help fight the importation and spread of this novel viral illness. Facilities housing stay over arrivals, such as hotels and guesthouses can register to report illness confidentially, and visitors can also self-report. The system will provide information to help identify and confidentially manage early warning COVID-19 symptoms reported by employees and guests in a rapid manner.
- Medicines Quality Control and Surveillance Department (MCQSD) forms part of the robust mechanisms for regulating medicines in CARICOM, in close collaboration with Member States, the CARPHA/PAHO Caribbean Regulatory System (CRS) and other partners such as PAHO/WHO. In health emergencies, they monitor the effectiveness, safety of medicines in use and on the market.
- Environmental Health and Sustainable Development (EHS) Department of CARPHA supports the Caribbean's sustainable development agenda by playing a lead role in key areas related to environmental management for optimal public health. There is a full-service microbiological and analytical laboratory that is accredited to ISO 17025 and provides environmental analyses, including water quality monitoring, plant, soil and tissue analyses, microbiological food testing, indoor environmental quality monitoring, and noise testing. Some of the areas where EHS supports Member States include monitoring, alert and outbreak response for communicable diseases, conducting Environment Impact Assessments (EIAs), and environmental auditing services led by certified ISO 14001 lead auditors.

In response to the Ebola emergency in West Africa in 2014, CARICOM Heads of Government at their Seventeenth Special Meeting in Port of Spain, Trinidad and Tobago in 2014 called for the establishment of a Regional Coordination Mechanism on Ebola (RCME) with a ten-point plan of action. Recognizing the vulnerability of the region and the likelihood

of future health threats, this RCME was then extended into the Regional Coordination Mechanism for Health Security (RCM-HS) to help counter any risk to regional health security from new and emerging threats. In recognition of the issue inherent in a region of very small, highly vulnerable and inter-connected countries and territories coupled with the political and economic integration movement, a regional approach to health security was considered necessary.

The RCM-HS provides oversight of the coordinated planning and implementation of the regional response to public health threats and emergencies with a focus on strengthening the capacity of member states, including those capacities related to the revised International Health Regulations (2005). The members of the RCM-HS are the Caribbean Public Health Agency (CARPHA) (Chair), Caribbean Community (CARICOM), Organisation of Eastern Caribbean States (OECS), CARICOM Implementation Agency for Crime and Security (IMPACS), Caribbean Disaster Emergency Management Agency (CDEMA), Pan American Health Organization/World Health Organization (PAHO/WHO), and selected Member States based on their lead roles in CARICOM. In 2017, participants from CARPHA Member States, regional and international organizations came together in Trinidad and Tobago to discuss the implementation of a Regional roadmap for health security.

Caribbean Regional governments have recognized that the Global Health Security Agenda complements the WHO IHR and has the ability to accelerate compliance through a multi-stakeholder approach. The CARICOM Council for Human and Social Development (COHSOD) agreed that the development of a five-year Roadmap for CARICOM would assist the regional governments in accelerating their national IHR compliance. The mechanism recognized that the region must focus on means of leveraging existing regional capacities, prioritize the importance of Regional Health Security at the political levels to garner continued support and develop means of sustainable financing through mechanisms such as the Stop the Epidemic There and Here (SETH) Fund.

A COORDINATED REGIONAL RESPONSE TO COVID-19

The coronavirus disease (COVID-19) outbreak was first reported in December 2019. The newly identified SARS-COV-2 virus, which was first detected in Wuhan City, China, with suspected links to an animal source, has rapidly spread from person to person. On January 30, 2020 the Director-General of the World Health Organization (WHO) declared the outbreak of a novel coronavirus disease (COVID-19) to be a Public Health Emergency of International Concern. Whilst the outbreak originated in China, in just over three months, the virus rapidly spread to more than 197 countries affecting more than 400,000 persons, as of March 25, 2020. On March 11, 2020 WHO characterized the outbreak to be a pandemic considering the 13-fold increase in COVID-19 cases outside of China with a tripling of the number of affected countries within the previous two weeks. The concerns associated with the rapid spread include the severity of disease and the disturbing lack of action observed in some countries. These, along with other factors, are expected to result in an increase in the number of cases and deaths in affected countries.

Figure 1. Timeline of CARPHA's key actions carried out in the context of COVID-19 preparedness and response.

Within a few weeks, the numbers of cases reported from China and countries reporting imported cases made it evident that the outbreak was spreading globally quite fast. It became obvious that it would only be a matter of time before an outbreak of great magnitude would impact the Caribbean. Early epidemiological assessments revealed that the elderly, those with chronic diseases, and smokers are among the high-risk groups for poorer outcomes [12, 13]. In the Caribbean context, there is a high prevalence of these risk factors, among others. The Caribbean region has one of the oldest populations in the world. Non-communicable diseases are the leading causes of morbidity and mortality in many countries in the region [4, 5].

According to the WHO, the public health security of all countries depends on the capacity of each to act effectively and contribute to the security of all. The early actions of China to quarantine people and restrict movements have been described as beneficial to the containment of the COVID-19 outbreak in China and delayed the spread of disease to other regions of the world. According to the Director General of WHO in a Statement on March 5, 2020 a collective, coordinated and comprehensive approach that engages the entire machinery of government is what is necessary to push back this COVID-19 epidemic [14].

Recognizing the vulnerability of the region and in keeping with its mandate, CARPHA sought an early audience with key experts in infectious disease internationally in January, 2020 prior to the spread of the disease outside of Wuhan. The advice obtained was acted upon to inform the initial health preparedness and response actions to the outbreak in the region.

Multi-Sectoral Response

CARPHA has been coordinating the CARICOM regional health response, conducting regular update meetings with Member States and partners including tourism partners, producing situation reports every two working days, performing tests on suspected cases from its Member States, enhancing its syndromic surveillance to capture suspected COVID-19 cases, developing technical guidelines including those on sampling, laboratory testing, ports of entry, algorithms for response, management of cases on ships, aircrafts, hotels and their staff, infection prevention and control, health sector response plan; regional communications plans, convening expert groups and participating in CARICOM Heads of Government meetings.

The Regional Coordinating Mechanism for Health Security was activated on January 29, 2020 as a means of bringing order and coherence to the responses of the Health and non-Health sectors as this outbreak evolved. Support for the RCM-HS was garnered from the highest level of regional governance. The CARICOM Council of Human and Social Development convened two Emergency Meetings and the CARICOM Heads of Government convened an emergency meeting of Heads of Government to discuss COVID-19 response and establish guidance for the region, including guidelines for cruise ships and other conveyances.

In keeping with CARICOM recommendations, various key actions were taken across multiple sectors, including:

- Coordination with the national Ministries of Health and Disaster Preparedness Offices
- Participation in national emergency preparedness planning processes
- Receiving training on critical areas such as: infection prevention and control

Health Sector

As a leading health agency, CARPHA took early actions to activate its Incident Management Team for Emergency Response and worked closely with regional and international health partners to define the response needed to this health threat and provide timely advice and assistance to its Member States. As the outbreak emerged, CARPHA convened multiple meetings to provide updates and information to assess the level of readiness and provide support for preparedness and response planning. CARPHA provided technical support and a plethora of technical guidance in keeping with international standards and best practice to ensure as uniform a response as possible across the region.

For COVID -19, CARPHA's Medical Microbiology Laboratory (CMML) is the regional reference laboratory and primary testing site initially, while internal capacity was subsequently built in various CARICOM countries by PAHO to enable testing for COVID-19, including Barbados, Suriname, Guyana, Dominica, Jamaica, Belize, Bahamas, and Haiti. Other countries in the region with capacity for testing included Martinique, French Guiana, Curacao, Aruba, St Martin, and the British territories of Cayman Islands, and Bermuda.

Another area where the strength of regional coordination was evident was in the actions of the Regional Security System facilitating the prompt transportation of samples to be tested at the CARPHA CMML from Member States and the adjustments made by the host country, Trinidad and Tobago, to expedite the clearance of samples by their Customs Department.

Most Caribbean countries have national emergency response plans and designated health emergency coordination structures in place. The last critical outbreak of similar nature in the region would have been Influenza H1N1 in 2009. Countries were advised to use the window of opportunity created by the delay in the importation of cases to the region, to review, update and adapt their pandemic influenza response plans for COVID-19, implement the necessary structures and legislative frameworks, ensure staff was trained and regular exercises carried out to prepare for an epidemic response. A decision was made by the COHSOD working group that a coordinated regional approach would be needed should the epidemic become escalated to a pandemic. CARPHA was tasked to develop a Health Sector Pandemic Response Plan for COVID-19 in this regard for a consistent approach among Member States. Figure 1 outlines the timeline of key actions carried out in the region in the context of COVID-19 response.

CARICOM reaffirmed CARPHA's responsibility and adopted their recommended Regional Approach to the Coronavirus – COVID-19 at the 31st Inter-Sessional Meeting of the Conference of Heads of Government of CARICOM 18-19 February 2020. In recognition of the rapid spread of the disease both at the epi-center and subsequently globally, CARPHA asked Member States to step up their preparedness and response actions as a matter of urgency.

A summary of other key actions recommended in the preparedness phase for the health sector includes:

- Public health authorities providing information to travelers to reduce the general risk of acute respiratory infections, via health practitioners, travel health clinics, travel agencies, conveyance operators, and at Points of Entry.
- Revision of stockpiles of medical equipment and logistical support tools.

- Revision of the list of medical and response personnel with adequate training and identification of staff with prior experience with the diagnosis and management of severe acute respiratory infection (SARS) and Influenza H1N1 cases.
- Member States should incorporate planning for health crisis responses into national disaster risk reduction preparedness and response mechanisms and plans.
- Engagement of all relevant stakeholders to identify response capacities and resources for a whole of government response.
- Development of pandemic plans and carry out simulation exercises for all relevant responders, including security forces.
- Implementation of routine measures, train staff, identify appropriate space and stockpile of adequate equipment in place at points of entry for assessing and managing ill travelers detected before travel, onboard conveyances (such as planes and ships) and on arrival at the points of entry.

Tourism Sector

The COVID-19 outbreak sent shockwaves through the cruise ship industry, and this was exacerbated by an outbreak aboard a cruise ship that docked and became quarantined at a port in Japan for an extended period of time. By March 13, 2020 there had been 696 cases and seven deaths associated with the ship. Development of disease during cruise ship voyages and the ability of their passengers to disembark at ports of entry continues to be a major challenge across the region. Multiple countries across the region have issued travel advisories, and some have banned travel to and from certain affected countries; the list is changing as the disease spread across regions.

In response, the Cruise Lines International Association (CLIA), the leading voice in the cruise ship industry, initially issued a series of enhanced policies for guests and crew who have recently traveled from or through China, including Hong Kong and Macau [15]. On March 8, 2020 the boarding restrictions were extended to South Korea, Iran, and any municipality in Italy subject to lockdown (quarantine) measures by the Italian government [16]. Five cruise ships (Diamond Princess, World Dream, Anthem of Seas, Westerdam and Costa Smeralda) have been quarantined after news of possible coronavirus infections emerged. The Diamond Princess in particular, represents the largest concentration of coronavirus cases outside China with 634 infections and two deaths. Another cruise ship, the Grand Princess, had been quarantined off the US coast with 21 people that have tested positive for coronavirus [17]. Several cruise operators have either canceled or changed their itineraries as countries across the world implement travel restrictions to curb the disease spread [18].

Airline travel has also been impacted globally, with multiple airlines canceling flights on multiple routes. In the Caribbean region, the regional carrier, Caribbean Airlines implemented measures to ensure their readiness in case of any eventualities, although none of their destinations had travel bans imposed. They also were permitting travelers on Caribbean Airlines with connections to or from mainland China, Iran, Italy, Japan, South Korea, and Singapore to rebook the Caribbean Airlines travel segment without change fees, subject to conditions [19].

In recognition of the significant contribution of the travel and tourism industry to the financial health and wealth of the region, CARICOM Heads and COHSOD - Health working group on regional coordination for the management of the virus, mandated CARPHA to lead the development of various regional guidelines for the management of cases on cruise ships, aircrafts, hotels, and among hotel staff.

Other organizations, such as the Global Tourism Resilience and Crisis Management Centre (GTRCMC), are working closely with CARPHA as the regional health lead in the GTRCMC, to promote a multisectoral coordinated response with academia, private and public health care providers, and tourism agencies for protecting Caribbean travel and tourism during the global coronavirus global crisis. During the response, the Head of the GTRCMC called upon the global travel and tourism industry to play a pivotal role in shaping global response efforts, with a focus on preventing exposure beyond the currently affected areas as well as to isolate infected persons from uninfected populations” [20].

CARPHA is also working with the Caribbean Tourism Organization (CTO), the region’s tourism development agency, and the Caribbean Hotel and Tourism Association (CHTA) with which it shares an MOU to enhance the health and safety of tourism and protect the tourism product. In keeping with their mandate of sustainable tourism, they facilitate the sustainability of tourism in the region through liaising with their partners, members, and stakeholders and providing technical advice on important issues e.g., standards development; the execution of projects on issues such as climate change, disaster risk management, energy efficiency [21].

Recognizing that tourism is the lifeblood of the Caribbean region and the essential need to safeguard the health and safety of residents and visitors to mitigate the impact of the COVID-19 threat to the region; and further recognizing the importance of building upon the collaborative efforts which are already underway, and the need to pool organizational resources to do so. On March 4, 2020 CARPHA, CHTA, GTRCMC formalize their efforts and messaging through the establishment of the COVID-19 Caribbean Tourism Task Force (CCTTF). The organizations acknowledged concerns about the high level of misunderstanding about the virus, which has elevated the panic level globally and resulted in the dissemination of a high level of misinformation. The CCTTF aim is to focus on sharing accurate information; strengthening monitoring at airports, sea ports, and hotels and accommodations; improving coordination among stakeholder organizations and locally between tourism and health officials; sharing best practices; training and education; and conducting tourism impact research. This agreement allows for rapid cross-sectional movement of resources, planning, targeted response, and messaging in response to this emergency. Other tourism specific response actions that were recommended include:

- Ensuring an inventory of the tourism properties with preparedness action plans and supporting plan development and testing
- Ensuring knowledge of protocols for management of illness among staff and guests
- Ensuring a protocol for reporting any illness to the Ministry of Health is in place
- CTO/CHTA work with CARPHA for Regional Level Training and Communications

Immigration, Customs and Security Sectors

The Caribbean Community (CARICOM) Implementation Agency for Crime and Security (IMPACS) was established by the Conference of Heads of Government in July 2006, as the implementation arm of a new Regional Architecture to manage CARICOM's action agenda on crime and security [22]. IMPACS played a significant role in the RCM-HS primarily through their Joint Regional Communications Centre (JRCC), that has responsibility for the operations and management of the Advance Passenger Information System (APIS), which screens approximately forty (40) Million passengers annually, specifically those entering, and traveling within the CARICOM Region by air and sea ports [23]. The information provided from APIS enabled countries to effectively monitor passengers arriving from high-risk settings, in the early stages of the outbreak.

In addition, immigration and customs departments were advised to take various sector-specific actions; viz:

- Provision of national protocols for personal protective equipment (PPE) use by Immigration and Customs personnel
- Receiving training on critical areas such as: infection prevention and control and handling of specimens or reagents for testing of COVID-19; strengthening passenger surveillance; and granting practice for cruise ships
- Participate in national emergency preparedness planning processes

The Security Sector engaged in various sector-specific actions, including:

- Ensuring the Security of Government Ministers and Key Officials as identified by the Cabinet
- Ensuring areas requiring additional security are identified as requested by Ministries of Health, e.g., quarantine or isolation centers, the main government stores of PPE, specialized health equipment and medicines, and the supply chain.

The Caribbean Disaster Emergency Management Agency

The Caribbean Disaster Emergency Management Agency (CDEMA) is a regional inter-governmental agency for disaster management in the Caribbean Community (CARICOM). The agency operates based on the principles of Comprehensive Disaster Management (CDM): an integrated and proactive approach to disaster management and seeks to reduce the risk and loss associated with natural and technological hazards and the effects of climate change to enhance regional sustainable development [24]. Through its Regional Response Mechanism (RRM) - a network of CDEMA Participating States (PSs), national, regional and international disaster stakeholders through which external response and relief operations in support of an impacted CDEMA Participating State (PS) are coordinated, CDEMA is recognized as the leader in regional disaster management. During the COVID-19 response, CDEMA's role was to identify the combined resources available and appropriately match

these to the needs of the impacted state(s), and effectively coordinate a response in the context of a global health threat [25].

Recognizing the wide-scale impact of COVID-19 across multiple sectors and the need for a coordinated response from whole of government, in addition to the key actions taken across multiple sectors, specific actions recommended for those in the private and education sectors included:

Private Sector

- Determining critical processes for maintaining operations of the Businesses
- Determining numbers and persons for maintaining operations
- Development of alternate working arrangements e.g., telework

Education Sector

- Establishment of reporting protocols for illness in staff and students
- Determining critical levels of staff required to keep schools open
- Ensuring parents receive instructions re reporting illness
- Ensuring that for institutions with residential facilities/health stations, there are guidelines for managing illness, quarantine, and reporting illness to the Ministry of Health for staff and students.

CONCLUSION

Caribbean Countries have rallied together to mount a regional response to the COVID-19 pandemic. Preparedness efforts in the region may have contributed to delayed importation of cases and afforded countries in the region time to shore up their health sectors and enabled a more robust whole of government response. The heightened level of vigilance not only at the country level, but across regional health security systems, is evidence of the early recognition of the risks of importation of cases on the health and wellbeing of the region's population (see Figure 2).

The regional coordination efforts, including the leadership of CARICOM and CARPHA as health lead, brought together a wide range of stakeholders and resulted in a coordinated approach to regional health security. The regional response was based on the utilization of existing networks and support systems for health security that saw cohesion and rapid response among key stakeholders. The ability to mobilize regional partners and their respective resources are based on these existing relationships between and within agencies and systems that facilitated ease of understanding amongst the various players.

Notwithstanding there were gaps in the regional response, some of which were influenced by the general lack of knowledge and understanding of the effect of the novel virus on human health, the lack of epidemiological evidence to inform response and the fragility of the CARICOM region to a new and emerging health threat. While there is no scientific evidence of whether the measures implemented by Member States were effective to delay the importation of cases to the region, the earliest confirmed cases imported to the region were exposed outside of the region in areas where containment measures had failed.

Figure 2. Timeline of Regional Actions and initial imported cases of COVID 19 to CARICOM Member States up to April 19, 2020.

The COVID-19 outbreak provided an opportunity to test the regional mechanisms for health security. The early response, support from regional Heads of Government, and the subsequent level of preparedness revealed that there is strong regional capacity for health security, despite the gaps identified in some areas. The Regional Coordinating Mechanism for Health security should continue to assess the internal capacity of its members and devise more cohesive and transparent methods for collaboration between members.

ACKNOWLEDGMENTS

The authors would like to acknowledge and appreciate the staff of the Caribbean Public Health Agency and those of the various partners and members of the Regional Coordinating Mechanism for Health Security for their hard work, resilience and devotion during the COVID-19 pandemic. A special thanks to Dr. Sastee Kissoodan, Behavioral Science Intern in the Surveillance Disease Prevention and Control Department for her contributions to developing the figures included in this paper. We would also like to acknowledge staff in CARPHA Member States who have ensured that the recommendations and actions have been implemented.

CONFLICT OF INTEREST

The authors declare that they do not have any conflicts of interest with respect to this paper.

**RAINWATER HARVESTING WATER QUALITY
PARAMETERS RELEVANT
TO THE CARIBBEAN REGION:
A SHORT OVERVIEW**

ABSTRACT

Harvesting rainwater for domestic use has been practiced for millennia and in recent historical times in the Caribbean. It is increasingly being put forward as a climate adaptation strategy. However, if it is to be promoted, due consideration has to be given by authorities to water quality. Although there is much literature on rainwater harvesting, the absence of specific regulatory responsibility for domestic rainwater harvesting means that there are few definitive guidelines for monitoring and testing. This short chapter aims to contribute to a better understanding of which water quality parameters might be of interest. This, though, needs to be coupled with a systematic approach to water safety assessment and planning.

INTRODUCTION

Rainwater harvesting, as a source of domestic water use, has been practiced around the world for millennia [1]. In recent times it has been increasingly put forward as a resilience and adaptation response to climate change and climate variability [2], and a water security response in the aftermath of extreme events when formal water systems might be compromised to a greater or lesser extent. The technicalities around the sizing, design, and configuration of systems for harvesting rainwater are relatively straight forward and understood. However, as more attention is given to rainwater harvesting as a climate adaptation intervention, what might be called the ‘governance aspects’ are coming under increasing scrutiny. These include the relationship with public health and questions of responsibility for ensuring appropriate water quality if authorities encourage the adoption of rainwater harvesting. A key part would be understanding what water quality parameters might be appropriate for the different potential uses of harvested rainwater.

This paper is a brief overview of water quality aspects that have been associated with domestic rainwater harvesting systems (DRWHS). It is based on a literature review of some 60 published reports, guidance documents, and peer-reviewed journal articles. The focus of the review is to indicate the water quality issues that have been associated with DRWHS and, in particular, those that have been identified as having a potential impact on water safety and human health. It should be stated that there is a great deal of literature available on the quality of harvested rainwater and there is a high degree of consensus around which are the most important aspects potentially affecting human health. Another important point is that many of the studies reported in journal articles are concerned with a particular water quality aspect peculiar to a set of environmental conditions that are seldom widely replicable. An example of such a study is reported by Báez et al. [3], which considered the chemical composition of rainwater collected in Mexico City. One of the purposes of the study was to determine the extent to which the atmospheric pollution present in Mexico City affected rainwater quality. Given its focus, the study looked at an extensive range of parameters. A similar study, also in Mexico City, considered rainwater used to provide drinking water fountains on a university campus. Such studies are informative as they consider the role and impact of atmospheric conditions, albeit under circumstances that are unlikely to be replicated in the Caribbean.

It is also apparent from the review that water quality standards are an issue. In general, there are no specific water quality standards covering DRWHS. That said, in most instances, it is the World Health Organisation Drinking Water Quality Standards that are used as the benchmark. A further difficulty with the application of appropriate standards is that DRWHS tend to fall outside of the drinking water quality regulatory regime and, as a result, monitoring and testing tend to be carried out on an ad hoc basis. The main focus of concern relates to risks associated with bacteriological contamination and the effects on human health associated with gastrointestinal diseases.

The presented evidence with respect to links between bacteriological contamination of water used for domestic purposes e.g. drinking, washing, cooking, but not outdoor uses and gastrointestinal diseases, is ambiguous. The guidance on use of rainwater tanks produced by the Commonwealth of Australia [4] notes that studies;

“found no measurable difference in rates of gastrointestinal illness in children who drank rainwater compared to those who drank mains water. However, there are examples of *Campylobacter* and *Salmonella* enteritis associated with rainwater tanks and one example of cryptosporidiosis/ giardiasis associated with an underground tank.”

On the other hand, several case studies have linked gastrointestinal illnesses with the consumption of untreated rainwater sources [5]. This is supported by evidence from the Caribbean, particularly studies of DRWHS water quality in the Grenadines, West Indies. Ahmed et al. [5] concluded that health risk assessment models should be used to manage and mitigate health risks associated with drinking and non-potable uses of harvested rainwater. In general, though, harvested rainwater, when properly collected, stored, and treated can provide a safe and reliable source of supply.

CONTAMINATION SOURCES AND HEALTH CONCERNS

Following the approach adopted in the “Handbook of rainwater harvesting in the Caribbean” [6], the following section sets out the potential sources of contamination and their associated health risks.

Contamination from Atmospheric Sources

Rainwater, as it starts to fall, is a very pure form of water. However, as it falls, it interacts with pollutants in the air, either reacting with them or absorbing them into raindrops. For example, the atmosphere contains carbon compounds, and their interaction with water gives rise to a weak carbonic acid, which can corrode materials it comes into contact with. However, the concentrations are so low that they pose no threat to human health. The presence of other physical particles and chemical compounds that may be entrained or react with rainwater depends on the activities and sources of pollution that emit or otherwise give rise to them. These do not have to originate in the local vicinity as contaminants can be carried by air currents and winds over considerable distances; the finer the particles, the further they can be transported. Airborne contaminants can either be of geomorphic or anthropogenic origin; Sahara dust, for example, is of geomorphic origin. Anthropogenic activity has substantially increased the concentration of trace metals in the atmosphere as well as manufactured chemicals emitted through industrial processes or other activities such as the burning of fossil fuels and the use of pesticides, insecticides, and fertilizers. Generally, airborne contamination is a problem in developed countries where industrial activity contributes to poor air quality and airborne pollution. Studies, such as those carried out in Mexico City indicate that in urban settings, air pollution is a risk factor that requires monitoring as high concentrations of trace metals have been associated with increased health risks. Agriculture, too, can pose a threat where there is widespread use of chemicals and fertilizers.

In the Caribbean, the main sources of ambient airborne pollution are associated with vehicle and transport emissions, industrial and waste disposal operations. As already mentioned, Sahara dust is a known source of airborne pollution, which varies intra- and inter-

annually and has been associated with respiratory difficulties. In the Pacific region, the presence of volcanic ash was noted as a potential risk factor. Wet and dry deposition of the dust particles could be an issue but is unlikely to have any significant water quality impact. Of more concern would be airborne particulates associated with bushfires or of geomorphic origin, mobilize from dry surfaces by wind, particularly during dry periods. With increasing aridity associated with climate change, greater influxes of dust, and mobilization of geomorphic particles (soil and trace elements e.g. magnesium), some consideration of their impact on operation and maintenance procedures should be given. Peters [7], in his study of rainwater harvesting practices in Carriacou noted that poor harvesting practices, particularly with respect to the maintenance of collection surfaces, were correlated with poor water quality.

Contamination during Rainwater Capture

Catchment contamination can be physical, chemical, or biological. Physical contamination refers to the dry deposition on the catchment surface of airborne particulate matter or the deposition of organic and non-organic matter. The airborne particulate matter has been considered above and would be washed off the surface during rainfall events. Organic matter (biological contamination) refers to vegetation and fecal matter deposited on the rainwater collecting surfaces. The fecal matter could be of either avian or other animal origins and is probably one of the main hazards of concern noted in the literature. Fecal matter is of concern because it is associated in the literature with the transmission of harmful pathogens, such as legionella, cryptosporidium, and giardia lamblia. These are of concern if there is a direct connection to sources of water, but there are other risk factors to consider, such as the time between deposition and entry through flushing. The risk can be significantly reduced by a combination of disinfection and ultrafiltration. In general, most fecal pollution from man and animals occurs at or below ground level, so water collected from raised roof catchments is likely to be of better bacteriological quality than that collected from ground-level catchments. Studies have highlighted the high variability in the presence of contaminants among different systems, their configuration, operation, and maintenance.

Decaying vegetation would affect physical characteristics such as color and taste, and chemical properties such as level of dissolved oxygen as well as chemical and biological reactions (e.g., algal growth). Under certain circumstances, high levels of chlorine used during disinfection interacting with naturally occurring organic material can give rise to the production of harmful by-products; but as the WHO states, “the risks to health from these by-products are extremely small in comparison with the risks associated with inadequate disinfection.” Non-organic matter, other than the particulates referred to above, could be materials and items that are on the collection surface, concrete blocks, and discarded items.

Chemical contamination may occur if the catchment surface consists of materials that have a coating that can leach or be dissolved in water that collects on the surface. This could be related to the use of roofing sheets coated with toxic paints (containing lead and other compounds), asphalt coverings, shingles, or other forms of covering. Although the use of lead-based paints has been phased out, there are still roofs that could be painted with them. A further potential hazard noted in the literature is the potential chemical reaction between deposited material and the roofing materials. Research, though, indicates that chemical

contamination is not a major concern, while geographic location and type of exposure are more important factors.

Contamination during Storage

This is probably the most important part of the linkages between harvested rainwater and humans as it is from storage that water is taken for use and consumption. The quality of stored water depends on factors such as the measures to prevent contamination before it enters storage, the residence time, maintenance practices, and the environmental exposure of the storage vessel. The inclusion of a filtration and disinfection system as part of the system greatly reduces the risk of infection and the use of contaminated water, which would otherwise pose a risk.

A common issue with storage is that it can provide a breeding place for mosquitos, which, although it does not pose a direct health threat through ingestion, puts people at risk of vector-borne diseases transmitted via mosquitoes, such as Dengue, Chikungunya, Zika, Malaria, and other potentially emerging vector-borne diseases. Prevention and control are, therefore, highly important. Traditional vector control measures have included the introduction of predatory fish that feed on mosquito larvae. In addition, other animals need to be excluded from access to the water storage, such as vermin (rodents, other insects), frogs, and toads, as they too can transmit potentially harmful pathogens. Once storage tanks are fitted with properly fitting lids, all openings are screened, and water extracted using a tap or pump, the likelihood of contamination can be reasonably reduced. With control over the introduction of new contamination (through the use of screens and first-flush diverters), any bacteria and other pathogens that are in the tank will eventually die-off, resulting in improvement of the stored water over time.

There are additional risks associated with the use of below-ground cisterns. Poor construction practices could allow seepage through cistern walls. In areas where use is made of septic tanks and soakaways, there is a further risk of contamination via groundwater ingress. Other risks are associated with potential flooding. Polluted floodwaters, particularly when contaminated with human septage, might inundate below-ground cisterns. If this happens then the water would be unusable and have to be drained, and the cistern disinfected.

Whilst above ground storage would not be as susceptible to flooding, exposure to outdoor elements may pose minor risks. For example, stored water temperatures are likely to be higher, and if pathogens are present, such as legionella, then this would provide favorable reproduction conditions.

The message with respect to storage is that minimizing health risks and maintaining good water quality can be achieved through the proper design of a DRWHS, preventing sources of contamination entering the storage together with proper maintenance procedures that prevent the build-up of sediments and conditions for algal growth.

Contamination during Maintenance

The last link in the chain where risks to human health may occur is during the cleaning and maintenance of the collection and storage components of the DRWHS. Maintenance

tasks include the cleaning and disinfection of collection surfaces, guttering, and piping; desilting, tank cleaning and disinfection; cleaning or replacement of screens, and traps. These are hands-on activities that use cleaning chemicals. Care needs to be exercised that material is not transferred from one part of the system to another or foreign material is introduced, such as on footwear.

WATER QUALITY TESTING

As indicated above, there are not any water quality standards specific to harvested rainwater. The applicable standards are those which would relate to the use of the water, whether for potable or non-potable use. In the absence of national standards for drinking water, the WHO standards have been widely adopted. The problem is not, therefore, an absence of standards but rather of a regulatory regime that addresses and enforces a requisite level of water quality sampling, testing, monitoring, and reporting requirements, and lays down codes of practices governing the installation, operation, and maintenance of DRWHS. Some jurisdictions have developed regulatory regimes, particularly where DRWHS are an important part of the national water supply landscape. Water quality criteria depend on the political and social setting as well as resources and capacity available. Generally, the better off a country, the more developed its regulatory system would be. Examples from the literature of countries that have regulations include; Australia, Bermuda, the United States, US Virgin Islands, United Kingdom, though this is not exhaustive.

Parameters

The following parameters have been mentioned in papers and reports in connection with the testing of the water quality of harvested rainwater. This is an extensive list, and it is unlikely that these would all normally be tested for. In the literature where proposals are made with respect to which parameters to test for, the range is very limited. This probably reflects the understanding of the practical challenges and difficulties involved. Most propose between 4 and 5 parameters, with an emphasis on biological parameters associated with gastrointestinal illnesses.

Parameter		Comment

CONCLUSION

Harvested rainwater is used around the world as a source of water for domestic purposes. Under certain circumstances, contact with sources of pollution can result in adverse health outcomes, especially among more vulnerable members of the population. If authorities are going to promote DWRHS as a climate adaptation strategy or a response to the adverse effects of extreme events that disrupt normal supplies, then more attention will have to be paid to the public health dimensions. This paper has aimed to make a contribution to the discussion that has to be had around what an appropriate monitoring and testing regime might look like and which parameters should be considered for inclusion. It is recommended that this has to be part of a process of water safety assessment and planning to ensure that whatever systems are put in place are appropriate, fit for purpose, and responsive to the potential hazard exposure.

ABSTRACT

The objectives of this chapter are to (i) to summarize the prevalence of bacterial vaginosis (BV) in Latin America and the Caribbean and (ii) review risk factors associated with BV and (iii) review health complications associated with BV. Using key search terms such as bacterial vaginosis, Latin America, and the Caribbean, a combination of 1,206 articles from EBSCO and PubMed were assessed for inclusion. Six articles met the inclusion criteria, and were retrieved and used in this review. Columbia had the highest prevalence of BV (39.6%), while Grenada in 2009 had the lowest prevalence (16.1%). Other regions had a prevalence ranging from 21.0-32.0%. In Bogota (Columbia), the most common co-infection was between BV and *C. trichomatis* 78 (14.0%) followed by BV and *Candida* 41 cases (7.5%), and occasional sexual relationship, being a sex worker, weekly consuming alcohol, and older ages were significantly associated with BV. Of this, 10% of women who had co-infection in Pacoti (Brasil), BV, and human papillomavirus (HPV) were the most common (14%). In Grenada, the most common co-infection was *Candida* (3.6%, 95% CI: 2.9-4.5). Parity was significantly associated with cervical pathology (OR = 0.51, 95% CI: 0.31, 0.83, $p = 0.007$) among women with BV. Studies within the Latin American and Caribbean regions had a low to average prevalence of BV. However, only limited studies have been conducted, and there may be possibilities of increasing patterns within different study populations. Therefore, more population-based studies with scientifically appropriate methodologies should be conducted in order to determine the population-based prevalence, associated risk factors, possible co-infections, and the trend in the prevalence of BV in Latin America and the Caribbean.

INTRODUCTION

Bacterial vaginosis (BV) is a polymicrobial vaginal infection which causes an alteration in the naturally occurring vaginal microbiota, as a result of a reduction in the naturally occurring *Lactobacillus* and an invasion of aerobic pathogens such as *Gardnerella vaginalis*, *G. prevotella*, *Mycoplasma hominis*, *Peptostreptococcus*, and *Bacteroides* spp. which rapidly multiplies in the vagina of women of reproductive ages [1-5]. Formerly known as *Gardnerella vaginitis*, the infection derives its name from *G. vaginalis*; a microbe which was first isolated from the genital of infected females, and was implicated as the causal microbe in 1892 [6, 7]. Although the presence of *G. vaginalis* remains strongly associated with BV, subsequent scientific findings have been able to isolate *G. vaginalis* from women who are asymptomatic and never end up with BV, thereby disputing the primary role *G. vaginalis* plays in the identification of BV [8-10]. About 50% of women infected with BV are asymptomatic; however, symptoms of BV may include milky discharge from the vagina, which often has a foul smell, and abdominal pain, which could get worse after the menstrual cycle [10].

To diagnose BV, a swab of vaginal discharge of the lateral and posterior vagina wall and assayed for an alkaline pH (>4.5) or clue cells using wet mount microscopy [11, 12]. Gram staining and Nugent scoring are widely considered the gold standards for BV. This criteria identifies and estimates the number of *Lactobacillus* and *G. vaginalis*, bacteroides, or mobiluncus in each field of a microscope slide and categorizes BV as normal bacterial flora (0-3 morphotypes), intermediate (4-6 morphotypes) and 4-7 morphotypes for the presence of BV [11, 12]. Because this assay technique may not be practical in some sites, an alternative known as Amsel's criteria is usually considered as an alternative to the aforementioned techniques. Amsel's criteria identify BV using four key properties such as a fishy odor of vaginal discharge, pH above 4.5, thin homogenous discharge, and = 20% clue cells in saline microscopy [11, 12].

BV is considered one of the most common vaginal infections in women of reproductive ages, with 1 of 3 women getting infected with BV at some time in their life. The etiology is unknown as no clear case definition for the disease has been determined. While previous studies suggest BV to be sexually transmitted, some studies also suggest otherwise [13, 14]. However, promiscuity remains a significant risk factor for BV among sexually active women with a greater risk among females who have sex with females, females who have oral sex and unprotected anal sex [15-17]. Because this infection may be asymptomatic and poses no direct implications on infected females, it is usually not considered a major public health concern. However, evidence has identified BV as a significant risk factor for pregnancy/birth complications as well as sexually transmitted infections (STIs) such as herpes simplex virus type 2, *Chlamydia trachomatis*, *Neisseria gonorrhoeae*, *Trichomonas vaginalis*, and human immunodeficiency syndrome (HIV) among women of reproductive age. The risk for these infections highlights the significance of BV in causing multiple complications and the need to implement public health actions to control this infection/risk [18, 19]. Some of the related birth complications associated with BV are preterm delivery and low birth weight in pregnancy [1, 20]. Preterm birth could result in poor cognitive functioning and other respiratory problems in low birth weight babies [1, 20].

Scientific studies in the United States (2000-2001) and the United Kingdom show a disproportionate distribution of BV among African American and Afro-Caribbean women when compared to other ethnicities, with higher risk amongst women of older ages and/ with multiple sexual partners [20-24]. Studies in Africa also identified multiple sexual partners, previous history of spontaneous abortion orthodox religion followers, douching practices, and male circumcision as significant risk factors associated with this infection [20-24]. Similar practices may exist among women of reproductive ages in Latin America and the Caribbean, which may elevate the risk and burden of the disease; however, only a few studies have been conducted to generate such findings from Latin America and the Caribbean. A review on the global epidemiology of BV revealed an intermediate prevalence of BV among subpopulations (Afro-Caribbean, African, Hispanic women) in developed countries, which may suggest there are similar trends within these regions [15]. Given the undeniable importance of researching and controlling the burden of BV as it relates to other STIs and health complications, it may also be important to understand the level of risk in individual countries to recommend evidence-driven solutions.

Table 1. Studies in countries within Latin America and the Caribbean

Country	Countries where studies were selected
Caribbean	Grenada
Latin America	Brazil, Chile, Colombia, Chile, and Haiti

This study aims to summarize the epidemiology of BV in Latin America and the Caribbean. This review provides an understanding of the current BV epidemiology and will help raise awareness regarding the prevention and control of BV in women of reproductive age (14-49 years) in Latin America and the Caribbean. The objectives are; (i) To summarize the prevalence of BV in studies conducted within Latin America and the Caribbean, (ii) review risk factors associated with BV within the regions (iii) review health complications associated with BV in Latin America and the Caribbean.

OUR STUDY

In August 2016, the St George's University Library was used to conduct a literature search using EBSCO HOST and PubMed, and cited references were evaluated for inclusion. The search terms were bacterial vaginosis, lower genital tract infection, prevalence, women of reproductive age, and 15-54 years. This literature search resulted in 1,206 publications (873 articles from EBSCO, 318 articles from PubMed, and 15 articles from references).

Inclusion and Exclusion Criteria

All articles in English (or English translation) and free full-text articles published within the past ten years were considered for inclusion. Peer-reviewed articles that were assessed for inclusion provided information on the prevalence and risk factors associated with BV in Latin America and the Caribbean. Publications that used random sampling technique, population-

based studies, antenatal/health care based samples, and reproductive health care center studies were preferably included in the review. When studies based on representative samples were not available, other studies conducted on special groups (pregnant women, women attending medical centers for HIV testing), were considered for inclusion. Only studies conducted on women of reproductive age (14-59 years), and studies using retrospective and cross-sectional designs were considered for inclusion in this review.

Figure 1. Summary of literature search.

Selection of Studies

Figure 1 shows a flow diagram describing the stages of the study selection based on the inclusion and exclusion criteria, which led to the final selection of studies used in this review.

Data Extraction

Six peer-reviewed articles from Latin America and the Caribbean were written in English (or English translation) and met the inclusion criteria for selection in the review. For each individual study, the following data were extracted; Age group, study design, country and city of study, study population, diagnostic criteria, sample size, sampling technique, and prevalence of BV. Figure 2 shows a summary of the sample sizes of studies conducted in Latin America and the Caribbean.

Figure 2. Summary of the sample sizes of students conducted in Latin America and the Caribbean.

Table 2. Prevalence of bacterial vaginosis of four countries in the Caribbean and Latin America

Location	Study location, age group and date of study	Study design, Selection process, and Sample size	Diagnostic Procedure	Prevalence of BV % (Number)
Brazil	Pacoti, 12-49 years ⁽²⁶⁾ 2007	Population based cross-sectional study of women of reproductive ages from 7 hamlets of and centre of Pacoti, (579 examined for BV)	Nugent scoring system	20.0 (116)
	Botucatu, 2006-2007 ⁽²⁷⁾	Cross-sectional study of pregnant women (5-40 weeks of gestation) from 8 family health strategy units of primary care services, (245 examined for BV)	Nugent scoring system	21.6 (53)
Chile	Santiago, 16 -54 years 2006 ⁽²⁸⁾	Cross sectional study of 100 randomly selected sexually active women attending Family Planning clinics.	Nugent Scoring System	32
Colombia	Bogota, 14-49 years, Feb-Dec 2010 ⁽²⁹⁾	Cross-sectional study of women with lower genital tract infection at 3 healthcare attention centers, (549 examined for BV)	Nugent scoring system	39.6
Grenada	Grenada, 15-49 years, Jan 2009-Dec 2011 ⁽³⁰⁾	Retrospective study of women of reproductive ages who had pap smear with a reported diagnosis of BV (2677 eligible women with BV within this period) 2009	Pap smear test	19.5
		2010		16.1
		2011		21.0
Haiti	Rural Haiti, >18 years, Mar 2013 ⁽³¹⁾	Cross-sectional systematic sampling of consecutive women complaining of vaginal itching, discharge, pain or lesion associated urinary symptoms, (206 examined for BV)	Amsel criteria	21.4 60.9

FINDINGS

Figure 3 summarizes the prevalence of BV in the studies in Latin America and the Caribbean. Table 2 shows the prevalence of BV in the studies. Bogota, Columbia, had the highest prevalence (39.6%) followed by Chile (30.0%) when compared to other regions with prevalence ranging between 16.1%-28.2% (25-31). In Bogota, the largest co-infection was found between BV and *C. trichomatis*, 78 (14.0%), and BV and *Candida*, 41 (7.5%) [25]. Also, a significant association between STIs and occasional sexual relationship, sex workers, weekly alcohol consumption, and older age was identified [25]. In Pacoti, out of 10% of women who had co-infection, BV with HPV was the most common (14%) [23]. However, not significant, BV was higher in women in older populations [23]. In Grenada, the highest co-infection was found with *Candida* (3.6%, 95% CI: 2.9-4.5) [26]. Parity was significantly associated with cervical pathology (OR = 0.51, 95% CI: 0.31, 0.83, $p = 0.007$) when nulliparous women were compared to women with 2 or more parity in women affected with BV [26]. In Botucatu, 66.0% of women infected with BV had symptoms; 35.8% ($p = 0.0026$) with vaginal odor, and 50.0% with white vaginal discharge. 57.1% of participants who had normal flora had clinical vaginal signs. No significant association was identified with age, ethnicity, marital status, education, parity, or time of sample collection in Botucatu [24]. Similarly, in rural Haiti, no risk factors were identified; however, 12.5% of infected women were identified to have increased vaginal discharge [27].

Figure 3. Prevalence of BV in studies conducted in Latin America and the Caribbean.

DISCUSSION

As illustrated in Figure 3, the prevalence of BV among women of reproductive ages in studies conducted within Latin America and the Caribbean was between 19.5-60.9%, with an average prevalence of 32.3% [30]. Due to the absence of prevalence studies in some countries

within the regions, the findings do not provide a generalized estimate of people who have been diagnosed with BV in the past ten years. We can suggest that due to the existence of similar epidemiological, geographical, and data availability characteristics of the countries in these regions, there may also be a similar prevalence of BV in countries where studies are lacking. Therefore, this review may be valuable to inform stakeholders of the possible risks in countries where studies were not conducted.

In order to present a recent review of BV estimates within Latin America and the Caribbean, only peer-reviewed articles conducted within the past ten years were included in this study. Although a literature review was published on the global epidemiology of BV, this review is the first of its kind that looks at the prevalence, risk factors, as well as co-infections or health complications associated with BV in these regions. This is expected to raise awareness on the prevalence of BV within Latin America and the Caribbean and inform advocacy for public health action to mitigate the potential risks of other STIs and health complications.

There are, however, some limitations related to the representativeness, diagnostic assay, and bias in this study. Only studies conducted within the past ten years met the criteria, hence, a small number of articles were eventually included in the review. This, therefore, limits the ability to estimate the prevalence of BV in the wider population. All studies were conducted with convenient samples, which may have introduced selection bias and prevented direct comparison between study populations in the regions. Only six studies were conducted within these regions, and no standard criteria of the study population for the literature search was used, which resulted in the inclusion of different study populations (population-based, married women, antenatal care based, or reproductive health care based) and prevented comparison between groups. Also, different diagnostic criteria were used to diagnose BV in women of reproductive ages, and because these techniques have different specificity and sensitivity as well as other properties, it may also affect the validity and prevent comparison between studies. In order to protect the reliability of the review, comparisons between groups were avoided. Similarly, variation in the prevalence of BV within the regions is consistent with results from other reviews; this suggests that the study is reproducible. However, no conclusion was drawn about the study population based on the studies included in this review.

Although the study conducted in Grenada [30] identified increasing prevalence of BV, yearly data in most countries within the study region has not been generated or readily available. In other cases, the results of the studies were not evaluated to identify prevalence trends. This lack of readily available data at the country level affects the ability to conduct studies with representative samples, resulting in the use of non-representative samples used in prevalence studies. Trend evaluation is often very important in evaluating disease outbreak amongst populations and can indicate whether there is a need for immediate public health action to prevent and control the disease within the population. This evaluation can be achieved by instituting an active surveillance system that captures all cases of BV within the country and as related to other STIs. Surveillance would make data readily available to conduct public health studies and to identify prevalence and risk factors for the disease in order to develop and execute evidence-based public health actions to control BV.

Based on scientific findings, BV infection in women has a high propensity of co-infection with other STIs as well as to lead to other health complications [25]. BV infection was found to be strongly associated with HPV, which is also a significant risk factor associated with cervical cancers in females. Although insignificant, BV infection in pregnancy is associated

with the risk of low birth weight and preterm delivery. Evidence within the Latin America and Caribbean regions are most likely to be identified in reproductive healthcare and antenatal care facilities. Because this infection is 50% asymptomatic, only individuals who display symptoms for BV and women who are pregnant are likely to be tested for BV and, as a result, BV statistics from these sites may be underreported.

A higher risk of BV in young women of reproductive ages was demonstrated in most studies conducted within these regions except for the study conducted in Pacoti, Brazil. Although the study in Brazil identified increased risks among the older population, the sample was not representative and, therefore, not comparable to other older populations, which may have resulted in the unusual disparity in the prevalence of BV [26]. This shows there is a need for further standardized studies to be conducted across the regions to identify the prevalence of BV among different sub-groups.

Given the various risks from infections, it is important for BV to be included as a priority STI for reporting in Latin American and the Caribbean countries. Epidemiological studies with representative, multi-level, population-based samples should be conducted to accurately determine the prevalence, risk factors, and protective factors associated with BV in women of reproductive ages in these countries. Also, prospective studies should be conducted to determine existing trends in the prevalence of BV risk factors associated with BV and possible BV co-infections that may exist in the regions. A standard diagnostic criterion should be adopted to allow for comparison of findings of the burden of BV. From studies conducted so far in these regions, prevalence of BV is intermediate and may potentially increase with time. It is important to conduct awareness programs in the form of sex education in schools, media campaigns, amongst others, to enhance the knowledge base and increase individual and public health actions to prevent BV among women in Latin American and the Caribbean.

ACKNOWLEDGMENTS

My profound thanks to God almighty, who has shown me his mercies and favor. My sincere appreciation goes to Dr. Emmanuel Keku for his relentless mentorship and encouragement during the course of my capstone. Gratitude is also extended to Attah Abraham, Benjamin Ogundele, Janille William, Ghisline Ghessoum, and Elan Amstrong for their moral support during this period. Lastly, to my parents, who have shown me love and have done everything within their power to always provide me with the best. I will never ask for anything more than the blessing of having you both in my life.

ABSTRACT

On a global scale, pesticides are commonly used in agriculture production, despite increasing awareness of the hazardous nature of many of these products. Pesticides have been classified by the World Health Organization (WHO) according to their potential for adverse effects on human health. Community and occupational exposures were found to be associated with increased risk for acute and chronic health problems such as reproductive disorders, neurological problems, flu-like symptoms, skin rashes, eye irritation, and nausea. Agricultural workers and members of their households experience high exposure to pesticides through dermal, inhalation, and ingestion routes. Studies have shown that health problems from pesticide exposures are more prominent in low-income countries that also have fewer resources to develop and adopt modern agriculture technologies. In the Caribbean, pesticide use is high in agricultural production, and studies have shown that agricultural workers do not commonly use personal protective equipment. These practices in the Caribbean region increase health risks for agricultural workers and members of their households. Developing effective interventions to improve safety in the use of pesticides among agricultural workers is necessary and should be a public health priority. To our knowledge, there is no published literature that describes approaches to developing and implementing effective interventions to improve pesticide stewardship - that is, the safe use of pesticides, in Caribbean countries. This chapter

* Corresponding Author's Email: lglasgow@sgu.com.

provides approaches to developing experiential, participatory, and learner-centered interventions aimed at behavior change, to minimize pesticide exposure and health risks among agricultural workers in the Caribbean region.

INTRODUCTION

On the global level, pesticides are commonly used in agriculture production. Increasingly, and more so in recent years, however, studies suggest that some pesticides can have significant negative impacts on human health, increasing risk to various chronic diseases such as Parkinson's disease, end-stage renal disease, and different types of cancers [1–5]. Besides, acute and chronic symptoms in humans, such as reproductive disorders, neurological problems, flu-like symptoms, skin rashes, eye irritation, and nausea have been found to be among common health problems that result from exposure to pesticides [6]. The World Health Organization (WHO) has classified pesticides based on their toxicological potential for human health and the environment [7].

The WHO expressed concerns about exposure to pesticides, among agricultural workers and other communities, particularly in low-income countries [7]. Pesticide exposure can occur through dermal contact, inhalation, and ingestion. Generally, the low-income countries lack innovative practices that are more common in high-income countries to maintain and improve occupational safety [7]. Safety precautions in pesticide usage also tend to be limited among agricultural workers in low-income countries as compared to the practice among workers in high-income countries [7]. The Caribbean has been described to be on a “pesticide treadmill,” indicating the high and increasing usage of pesticides in agriculture production [8]. As a result, concerns have been raised about food safety and the health of agricultural workers in the region from pesticide exposure [8].

The agriculture sector remains a significant contributor to the gross domestic product (GDP) in many Caribbean countries [9]. As such, it is imperative to take measures to reduce the burden of disease among the workers in the sector. Studies have suggested that unsafe usage of pesticides and poor pesticide protective behaviors, resulting in the increased exposure among workers, are due to the lack of knowledge and misperceptions of the risks associated with the use of the products [6]. In the absence of effective preventive interventions, a high percentage of workers in the agriculture sector in the Caribbean continue to be exposed to hazardous pesticides. The Pan American Health Organization (PAHO) has emphasized the need for countries to establish and enforce regulations to address occupational and environmental factors that constitute risks for diseases [10]. For the Caribbean, recommendations to minimize pesticide exposures among agricultural workers may also have significant implications for reducing the incidence of diseases.

In order to address the incidence of diseases associated with pesticide exposures in the Caribbean region, public health interventions must target behavioral change among agricultural workers. Studies have found few agricultural workers in the Caribbean region use protective equipment while handling and applying pesticides [11–14]. A study conducted in the Dominican Republic found that cytotoxic and genotoxic effects were associated with exposure to pesticides among applicators [15], showing the potential health effects pesticides may have on disease risk. To our knowledge, there is no published literature describing interventions aimed at improving pesticide stewardship- that is, safe use of pesticides, in an

effective and participatory manner in the Caribbean. This chapter provides recommendations for experiential, participatory, and learner-centered approaches in developing pesticide exposure prevention programs, focused on behavior change, for agricultural workers in the Caribbean countries. Lastly, this chapter includes a discussion about the benefits of social change for agricultural workers and the regional public health systems.

Application of Behavior Change Theory

Agriculture is the traditional livelihood in many Caribbean countries from colonial times. Although tourism, service, and manufacturing industries variably dominate the highest contributions to GDP across countries, the agriculture sector maintains a prominent role in economies and to ensure food security in the Caribbean. In most of the Caribbean countries, a significant segment of the population engages in commercial or subsistence farming. Small scale farmers dominate the sector [16,] which, in most islands, have only been moderately transformed into using modern technologies. Traditional and labor-intensive methods that resulted in hazardous exposures to pesticides are utilized even in contemporary times [9, 17]. Because many traditional practices are the norm, behavior change may be slow or resisted among agricultural workers.

The Transtheoretical model is a suitable framework on which to premise a preventive health program for the Caribbean region. On the belief that people do not change their behavior quickly, the Transtheoretical model postulates that people go through five incremental stages in behavior change: pre-contemplation, contemplation, preparation, action, and maintenance [18]. These stages represent a build-up in actions towards compliance and maintaining new behaviors. The model shows a progression from mental processing of information to contemplating action to adopting the action (behavior change) and, finally, to maintain the behavior change. Self-pacing and readiness are core principles that underpin the interventions at every stage. This learner-driven approach to change can easily transform into high acceptance of the interventions by agricultural workers. The progressive approach can also be critical to ensuring agricultural workers have both interest in and absorptive capacity for the behavior change interventions. Apart from applying a model that may be effective for positive behavior change among agricultural workers, the other sections of this paper highlight factors that should also be incorporated across the stages of implementation.

SETTING THE PACE FOR INTERVENTIONS

To develop a health promotion campaign, the first step is to determine the situation in the community. This step is referred to as formative research or situational analysis. This analysis is critical for informing the design of an intervention. Interventions that were developed for other contexts or previously implemented may not offer the best fit in the current environment and time. As for establishing a pesticide protective program, the intention is to investigate the situation pertinent to the handling and application of pesticides by agricultural workers. Community-Based Participatory Research (CBPR) approach is suitable for application in this investigation, requiring the target group, that is, the agricultural workers, to contribute their

knowledge and experiences in planning and developing the research. A wide cross-section of the workers should be consulted to create a stakeholder map and tools for the inquiry. Public health practitioners, academicians, and other preventive health experts should participate in this initial research designing consultations to ensure that scientific methods and best practices are considered and appropriately applied at this initial phase. Broad-based participation at this early stage can be advantageous to generate interest and increased participation in subsequent activities.

The formative research should incorporate a variety of themes that address agricultural workers' knowledge, interests, perspectives, attitudes, and practices related to pesticide usage and health. Such information would be valuable to guide in framing messages and activities to address gaps in knowledge about pesticide safety, poor attitudes, and unsafe practices. Data, which describe morbidity and mortality rates related to pesticide use, can be collected from registries and other authoritative sources, such as from government surveillance reports. Analysis of secondary data may serve to provide crucial evidence of the magnitude of the problem in the sector. Representatives for the agricultural workers and institutions, public health practitioners, academicians, policymakers, and other public health experts should review all results and consult in the development of the interventions, ensuring proper alignment of the interventions with the needs and expectations of the agricultural workers.

GOAL-DRIVEN PROGRAMS

Interventions should be developed with the ultimate goal of reducing the prevalence of health problems among agricultural workers. To achieve this goal, the interventions should focus on addressing gaps in knowledge and practices regarding the safe use of pesticides. Heightening awareness about the possible adverse effects of exposure to pesticides and, at the same time, increasing knowledge about safe practices is paramount to behavior change. Behavior change should aim to increase pesticide stewardship through: 1) use of personal protective equipment such as using masks and gloves, and 2) practicing good agriculture hygiene, such as washing clothes after using pesticides and washing hands before eating and using the toilet. By reducing exposure to pesticides, agricultural workers will also decrease the risk for developing health problems such as cancers and reproductive and neurological disorders [1-5]. The support of public health experts and policymakers can be instrumental in affirmative actions to address agricultural workers' health needs.

Interventions should seek to be both systematic and strategic. Purpose-driven interventions can have the most substantial effect on the knowledge, attitudes, and practices of the agricultural workers. Some key components in a campaign to address exposure to hazardous pesticides can include: 1) call for attention to the public health issue and its impact on health, 2) identification of the target group of agricultural workers in which pesticide exposure is present, 3) documentation of current behaviors regarding the use of pesticides, 4) assessment of the potential adverse health effects due to pesticide exposure in the target population, 5) a plan to protect the health of the agricultural workers and their communities, and 6) evaluation of the overall social and economic benefits. Contact information for the program implementers and sources of additional information should be provided to the workers. The interventions should be progressive – reflecting the tenets of the

Transtheoretical model, from pre-contemplation to action to maintenance of the new behavior. This approach is highly practical, although the timeframe could vary for individual workers to achieve the goal - safe use of pesticides - and subsequently reduce pesticide-associated health disease and conditions.

COMMUNICATION MEDIA

Three communication tools that are variably but highly accessible to Caribbean agricultural workers are television, radio, and telephone. Within the last decade, telephone access increased significantly in the Caribbean region, in particular, with cellular (or mobile) phone usage. The competition between the increasing numbers of telecommunications service providers and government regulations have been beneficial to keeping the cost of telephone and television services at affordable rates. Messages to be used for mobilization and in the interventions should be prepared in formats for dissemination through these various media to reach the largest cross-section of agricultural workers. Radio is advantageous for use in various locations, including in workplaces such as farms. Using the radio to disseminate information would increase the amount of time for which messages can be aired, even during prime time, at an affordable cost. Radio production is also relatively cheap. Using television is advantageous to disseminate information using interactive formats such as stories, charts, and pictures. These formats may be more suitable for persons with lower literacy. Television and radio are also suitable for persons with hearing and vision impairment, respectively. Texting, via cellular telephone, allows for disseminating and receiving short instant messages.

ENSURING APPROPRIATENESS IN MESSAGING

Age, literacy, and media appeal must be considered in developing messages to explain pesticide exposure risks and protective measures. While television and radio are more commonly accessed by middle-aged to older people, social media platforms, such as Whatsapp and Facebook, have greater appeal for young people in the Caribbean. Messages should be presented in formats that are suitable for agricultural workers with different literacy levels. The messages may also be crafted for the attention of the other household members and the wider community that interact with and support the agricultural workers. The channels for dissemination of messages will need to be selected based on suitability to accommodate formats such as tables, still charts, interactive charts, pictures, verbal presentations, and short or long text. Local dialects can be useful to express the meaning of some content or to simplify messages [19]. Representative groups of agricultural workers' can be consulted to review messages and to provide feedback to improve appropriateness and relevance for the wider group. Segments of the workers' group can also be involved in piloting messages.

MARKETING AND GETTING ATTENTION

Marketing of the pesticide prevention intervention should be conducted through direct and indirect means. Firstly, branding has the benefit of allowing the target group to identify with interventions through the use of distinctive design, content, and images [20]. For example, indirect marketing of the programs can include Caribbean- or island-flavored songs, jingles, theatricals, and posters via television and radio. These activities are symbolic of Caribbean traditions and can readily capture the attention of the agricultural workers. Cultural features, such as calypso beat in songs, local theater groups performing plays and displaying national colors on posters, can enhance the marketing strategy to capture the attention of the agriculture workers. Carnival and religious symbols may also be appropriate to grab attention to public health messages in the Caribbean setting.

Secondly, the aim of breakthrough inattention is to attract and engage the target group [20]. The messages should be crafted to appeal specifically to the agricultural workers and provide a sense of urgency for behavior change. Some practical and feasible new behaviors should also be presented to attract attention.

Peer-to-peer marketing among agricultural workers may result in increased support for participation in the interventions. Information about time, place, and format for interventions should always be provided in intervention marketing campaigns. Community groups, agriculture organizations, and other influential organizations, such as donor agencies, can be instrumental in marketing programs to the agricultural workers. The influence of gatekeepers and influential local leaders can affect the community's reception to marketing [19]. Influential members and leaders can reject intervention or messages, based on how it personally impacts them, and also influence the decisions of the wider group. In such cases, the message or intervention will need to be revised to increase its appeal to both the leaders and workers.

POSSIBLE CHALLENGES AND SOLUTIONS

The choice of the communication channel can determine the reach of messages to agricultural workers. It is beneficial for a wide range of media to be used to disseminate information. This, however, may have cost implications leading to fewer media being used segments of the target population not having access to information. This lack of access to information can have a significant impact on the success of the program. To address this issue, media accessibility and preference for the agricultural workers should be identified in the formative research. In pre-testing messages, the reach through various media should also be investigated. The most widely accessible media should eventually be used in the campaign.

Developing a non-specific message is another challenge. Messages that are not sufficiently tailored for a specific group may not attract interest and participation in the intervention. This challenge can be addressed by doing stakeholder mapping to identify the particular characteristics of the agricultural workers that should be targeted in messaging. Documenting the demographic characteristics of the agricultural workers, such as literacy,

age, and preferred communication medium, is also useful for ensuring messages about risk and protection from pesticide exposure, are appropriate and appealing.

An ethical issue may constitute unrealistic and unreasonable promises regarding behavior change and outcomes. Messages can be exaggerated and lead to disappointment when benefits are not perceived as proportionate to the effort for adopting the behavior change. To avoid this challenge, evidenced-based interventions should be adopted, with clearer indications of cause/effect relationships [19]. Such an approach may include the application of public health theories and results from scientific studies [20].

The introduction of excessively costly or unaffordable practices to replace current practices can be considered as unethical as it introduces bias by limiting participation of segments of the target group [19]. For example, large farmer holders may be able to purchase respirators for use when applying pesticides while small farm holders are deprived of acquiring this protective equipment. If cheaper alternatives are not available, the agriculture workers may be forced to resort to using ineffective methods, such as covering the mouth with a cloth while applying pesticides. The inability of the target group to maintain a behavior will also be counter-productive to achieving intervention goals. Although social marketing can result in ready adoption of alternative behaviors, the capacity, and resources that reside among agricultural workers and in the wider community should be assessed in the formative research and considered in the development of interventions.

METHODS FOR EVALUATING THE EFFECTIVENESS OF PESTICIDE EXPOSURE PREVENTION INTERVENTIONS

Evaluation is an essential component in the intervention cycle and should be planned during the initial development phase. This process should cater to agricultural workers reflecting on their experiences during interventions, identifying changes in behaviors, and evaluating the potential impacts of the changes on their health and well-being. These steps support experiential learning - learning through practice and being able to identify and define the outcomes. Formative, process, and summative evaluations should be conducted. The formative evaluation includes an assessment of the situation – for example, determine which workers use pesticides, how are pesticides applied in work settings, frequency of pesticide use, compliance with good agricultural practices, and pesticide stewardship. Process evaluations should determine whether a behavior is changing during the intervention and what factors contribute to positive or negative responses to the intervention. The summative evaluation should focus on what impact was achieved, unintended effects, and cost-effectiveness of the intervention upon completion. The summative evaluation should indicate the quantity and quality of change from the formative evaluation. Text messaging, surveys, and feedback via radio and television may be used to collect both qualitative and quantitative information for these evaluations. A final report should be prepared and submitted to all stakeholders.

CONCLUSION

Social change is the process of improving the conditions of individuals and communities through the use of interventions [21]. The campaign among agricultural workers caters for social change with a focus on the behavior of workers to improve pesticide stewardship in the agriculture sector. Achieving positive behavior change towards minimizing exposure to pesticides has implications for the health and well-being of the Caribbean population. The agriculture industry is one of the oldest establishments in the Caribbean, and many learned traditional behaviors are still dominantly practiced despite increasing evidence of the hazardous nature of some pesticides and their effect on one's health. The recommendations in this paper draw on the Transtheoretical model, which postulates an incremental approach to behavior change. The recommendations, such as applying a self-driven behavior change model in interventions, facilitating community-based participatory learning, and identifying behavior change through reflection support experiential, participatory, and learner-centered approaches in the development and implementation of the interventions to address health risks from pesticide exposures among Caribbean agricultural workers. Social change can also arise from sharing information about innovations and results [20, 22]. This intervention may be replicated in local communities with the results from the evaluation of each cycle disseminated to improve subsequent deliveries of the intervention. The results can also be disseminated across the Caribbean countries; however, each country should ensure that the recommendations are adapted to its specific context.

Finally, reducing exposure to pesticides can result in significant improvement in the health outcomes of agricultural workers in Caribbean countries. The spin-off effect is reducing the burden of diseases and the burden on the health care system while allowing resources to be reallocated to development. Generally, an effective campaign on safely using pesticides among agricultural workers in the Caribbean can contribute to protecting their health and improving the overall health status of the region.

ABSTRACT

Though the burden of breast cancer is on the rise globally, data in the Caribbean region is limited. We examined the trend of breast cancer in the tri-island state of Grenada, Carriacou, and Petit Martinique between 2001 and 2010 in women over 20 years old. A cross-sectional study was conducted. Surveillance and biopsy data from Grenada General Hospital were used to analyze the trend in breast cancer. Data were extracted on biopsies with confirmed breast cancer. The data was collated using an EXCEL spreadsheet and analyzed using EpiInfo to summarize the demographic and pathologic characteristics of each case. Grenada reported 207 breast cancer cases between 2001 and 2010. The incidence rate was 26.4/100,000. St. David's parish had the highest incidence rate (54.5/100,000), and St. Patrick's parish reported the lowest (24.2/100,000). Invasive ductal carcinoma was the most common subtype of breast cancer (76.8%), followed by invasive lobular carcinoma (8.2%), undefined ductal carcinoma (3.4%), mixed carcinoma (2.9%), Ductal in situ carcinoma (2.4%), and invasive adenocarcinoma (1.0%). Other sub-types of breast cancer that were less than 1% include; lobular in situ carcinoma, undefined adenocarcinoma, differentiated carcinoma, undifferentiated carcinoma, invasive squamous cell carcinoma, sarcoma, and others. The majority of the

* Corresponding Author's Email: ekeku@sgu.edu.

cases occurred in the age range of 40-49 years old. Between 2001 and 2010, Grenada showed a decreasing trend in breast cancer rates, and the incidence rate was lower than those reported by other Caribbean islands. Reasons for elevated incidence rates in St. David deserve further study.

INTRODUCTION

Breast cancer is the leading type of cancer frequently diagnosed in women globally, with an estimated 1.4 million incident cases and 459,000 deaths in 2008 [1]. Breast cancer account for 25% of all cancer cases and 15% of all cancer deaths among females [2]. In the Caribbean region, 24.6% of all cancer diagnoses are breast cancer cases, and 15.8% of all cancer-related deaths are due to breast cancer [3]. In 2008, Trinidad and Tobago reported an incidence rate of 36/100 000, and Barbados reported a rate of 74/100 000 [4].

Research has shown that there has been an increase in global incidence rates of breast cancer. There are few studies that have examined the growing incidence rate of breast cancer in the Caribbean region; therefore, further exploration in this region is needed. In the tri-island state of Grenada, Carriacou and Petit Martinique, health service personnel have reported an alarming increase in the number of newly diagnosed breast cancer cases in women under the age of 50 years [5]. The purpose of conducting this study was to better understand the incidence of breast cancer amongst the Grenadian population. The objective of the study was to determine the trend (person/place/time) in the newly diagnosed cases of breast cancer in the tri-island state of Grenada, Carriacou, and Petit Martinique during the years of 2001-2010 [6].

OUR STUDY

A descriptive epidemiologic study was performed to analyze the trend(person/place/time) of all the reported diagnosed cases of breast cancer over a defined period of January 1, 2001 through December 31, 2010. The study utilized secondary, passive surveillance data from the Pathology Department at the General Hospital in Grenada, West Indies. The surveillance data provided information on each individual who had undergone breast tissue biopsy at the General Hospital and was confirmed as breast cancer cases. Breast tissue biopsy, followed by histological examination, was used as the primary mode of identifying cancer cases.

Target Population

The study area was the Caribbean tri-island state Grenada, Carriacou, and Petit Martinique. Grenada is located northwest of Trinidad and Tobago, northeast of Venezuela and southwest of Saint Vincent and the Grenadines. The target population included all the female citizens and or legal residents of Grenada, Carriacou, and Petite-Martinique.

Study Population

The inclusion criterion was outlined as all the confirmed cases of breast cancer in women under the age of 50 years in Grenada for the ten-year period 2001-2010 identified in the Pathology Surgical Entry Book, available at the Grenada General Hospital. For the purpose of the research, the definition of a case was the medically confirmed (breast tissue biopsy followed by histological examination) presence of an invasive/non-invasive ductal or lobular carcinoma of the breast.

The study excluded all breast cancer cases that were not identified in the surveillance data described in the Pathology Surgical Entry Book. All the diagnosed cases of breast cancer in men on the islands of Grenada, Carriacou, and Petit Martinique were excluded from the study. Furthermore, all cases reported out of the demarcated ten-year period that began on January 1, 2001 and ended on December 31, 2010, were excluded from the study.

Ethical Justification

Prior to the start of the research, ethical approval was sought through the Institutional Review Board (IRB) at St. George's University, Grenada-West Indies. Ethical approval was granted. All ethical protocols were observed during the research process.

Data Collection

A formal written request of permission to access the surveillance data and perform the research was sent to the Permanent Secretary in the Ministry of Health in Grenada. After permission was granted, the data collection process began.

All the confirmed cases of breast cancer were identified from the Pathology Surgical Entry Book. This book provided data on patient demographics and pathologic characteristics. For this study, the variables under investigation were as follows: date of diagnosis, age at diagnosis, parish of residence, and the specific sub-type of breast cancer. The data collected was inputted into a spreadsheet and exported into EpiInfo for data analysis. One data collector was responsible for the data collection process.

Statistical Analysis

Descriptive statistics from EpiInfo were used to summarize the demographic and pathologic characteristics of the identified cases. An analysis of the data was carried out to investigate the frequency of the different breast cancer sub-types amongst the cohort. Annual age-adjusted incidence rates of breast cancer over the specified period were calculated and analyzed on a graph to observe the trend. A time-trend analysis for the reported annual age-adjusted incidence rates was then applied to the data. In addition, the breast cancer incidence rates in the various parishes were assessed and compared.

FINDINGS

There were 207 confirmed cases of breast cancer that were identified from the Pathology Surgical Entry Book (General Hospital) in the tri-Island state Grenada, Carriacou, and Petit Martinique between 2001 and 2010.

Annual age-adjusted incidence rates for the period were calculated and illustrated graphically (see Table 1, Figures 1-2). When a time-trend analysis was applied to the age-adjusted incidence rates, no clear trend was established. Instead, there were relatively unstable and inconsistent changes in the age-adjusted incidence rates across all age categories.

Figure 1. Distribution of newly diagnosed breast cancer using age-adjusted incidence rates (across all age categories).

Figure 2. Distribution of newly diagnosed breast cancer of all ages between 2001-2010, using age-adjusted incidence rates.

Distribution of Breast Cancer by Type

The most common type of breast cancer reported in the population was invasive ductal carcinoma (76.8%). This was followed by invasive lobular carcinoma of the breast (8.2%), lobular in situ carcinoma (LCIS) (0.5%), differentiated carcinoma of the breast (0.5%), undifferentiated carcinoma of the breast (0.5%), undefined adenocarcinoma of the breast (0.5%), sarcoma of the breast (0.5%), and invasive squamous cell carcinoma of the breast (0.5%).

Age-Distribution

The youngest confirmed case of breast cancer was 26 years old, diagnosed in 2001. The case was reported as residing in the parish of St. John and was diagnosed with invasive ductal

carcinoma with no metastasis. The oldest confirmed case of breast cancer in this study was 90 years old and was diagnosed in 2010. The patient was a resident of the parish of St. George and was diagnosed with invasive ductal carcinoma with no metastasis.

Table 2. Summary of breast cancer sub-types in the population, 2001-2010

Sub-type of Breast Cancer	Frequency	% Frequency
Invasive ductal carcinoma	159	76.8
Invasive lobular carcinoma	17	8.2
Ductal in situ carcinoma	5	2.4
Lobular in situ carcinoma	1	0.5
Undefined ductal carcinoma	7	3.4
Invasive adenocarcinoma	2	1.0
Undefined adenocarcinoma	1	0.5
Mixed carcinoma	6	2.9
Differentiated carcinoma	1	0.5
Undifferentiated carcinoma	1	0.5
Invasive squamous cell carcinoma	1	0.5
Sarcoma	1	0.5
Other	5	2.4
Total	207	100

The most commonly occurring age for confirmed breast carcinoma was 46 years. The average age was 53 years, with a standard deviation of 14.53 and a variance of 211.15. The median age was 49 years. Inter-quartile age range distributions were 41 (25%) and 65 (75%) respectively. When an analysis of the incidence rates of breast cancer by age-distribution was applied to the data, the highest rate was noted in the 40-49 age category followed by the >60 and 50-59 age categories (see Table 3).

Table 3. Total incidence rates (un-adjusted) of breast cancer in Grenada 2001-2010

Age Category	Number of Cases	Female Population	Incidence Rate/100 000
20-29	3	10158	29.5
30-39	37	6203	596.5
40-49	65	5115	1270.8
50-59	37	4690	788.9
>60	65	5282	1230.6
All Ages	207	31448	3916.3

Figure 3. Distribution by parish of newly diagnosed breast cancer in Grenada 2001-2010.

The highest incidence rates of breast cancer were reported in St. David (544.8/100 000). The second highest rate was reported in St. George (472.9/100,000), followed by Carriacou and Petit Martinique (362.7/100,000). The lowest rate was reported in St. Patrick (242.4/100 000) (see Figure 3). Overall, out of all the confirmed cases of breast cancer in each parish, invasive ductal carcinoma was the most common sub-type noted throughout (Tables 4-5).

Geographical (Parish) Distribution

DISCUSSION

Between January 1, 2001 and December 31, 2010, 207 breast cancer cases were identified. The most recent calculated age-adjusted incidence rate was 31.1/100,000 for the year 2010. Upon regional evaluation, Grenada still has a fairly low incidence rate when compared to Jamaica (56.8/100,000), The Republic of Trinidad and Tobago (36/100,000), and the Dominican Republic (32.7/100,000) [4]. From a global perspective, Belgium has the highest incidence rate of breast cancer, with an age-adjusted incidence rate of 109.2/100,000

[4]. Compared to other countries around the world, the low incidence rate of breast cancer in Grenada can be due to demographic factors, such as the country having a predominantly black population. The Centers for Disease Control and Prevention (2015) stated that white women had a higher risk of developing breast cancer compared to black women.

Overall, the highest incidence rates across the time period were observed in the 40-49 age category, and the lowest incidence rates overall were observed in the 20-29 age category. Like in many other countries, we can conclude that in Grenada, new breast cancer cases is not a common disease amongst a younger population. Breast cancer is the most common cancer amongst females globally [7]; hence, there has been a global rising of attention to the disease. Breast cancer awareness has increased on the island of Grenada in the last decade, and this could explain the periods of increase where more people might have been seeking professional care.

On September 7, 2004 and July 13, 2005, Hurricanes Ivan and Emily hit the island of Grenada. Significant changes were noted in the year 2005, with a downward trend of breast cancer incidence rates observed for all age-categories. The population may have suffered psychological trauma following the environmental disasters and, as a result, may have been oblivious to the statuses of their health, resulting in the decreased identification of cases. More significantly, the disasters caused severe destruction and devastation to the island, both physically (landscape) and economically. The island's water and electrical supplies were interrupted for a long period. With this, health services were only available on a limited scale to the population. This resulted in a major disruption to the health care system and could explain the observed decline in the trend of breast cancer incidence rates.

An unstable economic situation has been reported for Grenada over the last five years. This instability is reflected in the results collected between the years 2007 and 2010 that demonstrate instability and inconsistency (no trend established). Prior to the July 2008 elections, high inflation rates were seen in the price of basic commodities-food and fuel. In 2009, the economic performance was recorded as -5.7% of the GDP. The recession could be an explanation for the downward trend seen in the years 2007 and 2009.

The recession has considerably affected the Grenadian economy and, overall, the functioning of the Grenadian health care system over the years. Grenada's health care system is predominantly universal; however, the system is overburdened and lacks sufficient human and financial resources to offer universal coverage for all. Therefore, this results in long waiting times when patients seek health care services. Reluctantly, many people are forced to pay out-of-pocket for the services they need. To those who cannot afford this service, they are subjected to waiting for long periods of time to have procedures performed, such as breast tissue biopsies. This would result in many cases remaining undiagnosed.

Invasive ductal carcinomas followed by lobular carcinomas have been described as the most common pathologic breast cancer types. Medullary, mucinous and papillary carcinomas of the breast have been described in the literature as rarer histological subtypes of breast cancer [6-8]. Medullary cancers have been said to account for 2% of all breast cancers globally [9]. It is most commonly found in women who have the mutated BRCA-1 gene. Current research suggests that medullary carcinomas have a more favorable prognosis compared to invasive ductal carcinomas of the breast [6, 8]. Mucinous carcinomas are said to account for approximately 2% of all breast carcinomas globally [10]. They are slow growing tumours, with close to none or very slight lymph infiltration, and usually have a more favorable prognosis compared to other types. Tubular carcinomas of the breast account for

approximately 1% of all breast cancers, globally [11]. This statistic is consistent with the findings of this study. The recurrence rate of this sub-type is very low. Papillary carcinomas of the breast usually does not infiltrate other body parts and normally affect older people [12]. This demonstrates a good prognosis. Papillary carcinoma subtypes were noted in very insignificant proportions in the population of this study.

A recent study carried out to assess breast cancer morbidity in peri-menopausal women found that 42.7% of the cases identified from the population were pre-menopausal [13]. This study shows that the majority of the population with breast cancer were pre-menopausal women. Fifty one percent of the reported cases in the Grenada population were under the age of 50 years. Furthermore, 34% of the reported cases were between the ages of 30-45 years. With reference to an earlier study, the age of menopause is observed to be 50 years [14]. A significantly large proportion of the cases reported were pre-menopausal, and this may suggest the possible existence of a BRCA-1 mutation within the population. BRCA 1 and BRCA 2 mutations are associated with early onset of breast cancer in women [15].

Age is a known risk factor for breast cancer; there is an increased risk with age. However, there is a much poorer prognosis for younger diagnosed cases [16, 17]. This is because younger cases have more aggressive forms of breast cancer with poor prognosis [16]. With a significantly large percentage of cases in the population identified under the age of 50 years, there is a need for the Grenadian government to design health promotion programs that encourage screening for breast cancer with the goal of early diagnosis.

The survival rate from breast cancer is considerably lower in the younger population. It is believed that this is due to the strong association with BRCA gene mutation [18]. In our study population, 19% of all the cases were below the age of 40 years. This is a significant proportion, and preventive measures should be applied to the population to ensure early diagnosis, which increases survival chances and improved quality of life.

Significant spatial distributions (by parish) of breast cancer were described in the findings of the research. Current research is proposing possible associations between geographically distributed environmental toxins and the development of mutations on the BRCA-1 genes [19]. The parish of St David reported the highest incidence rate followed by St. George, and St. Patrick having the lowest incident rate. In Grenada, families are normally clustered by geographical region (in this case, parish). With this, further research needs to be conducted to see if an association exists between the distribution (parish) of incidence and familial history of breast cancer and mutation in the BRCA1 gene.

In conclusion, the Ministry of Health in Grenada needs to make a commitment to develop and establish appropriate surveillance systems for breast cancer. A local cancer registry for breast cancer was commissioned in 2008 but, to date, it still requires much work in order to be considered fully functional. A true estimate of the burden of breast cancer on the population can only be analyzed when proper surveillance systems are put into operation.

Furthermore, in the effort of prevention, the Ministry of Health should promote early breast cancer detection through screening by mammography. The American Cancer Society currently has guidelines for age at mammography to begin at 40. Much research has been carried out to assess the benefits of early detection of breast cancer mainly through screening by mammography. Studies have indicated that early detection substantially decreases mortality rates [20, 21]. One study claimed that mammography screening had been shown to have the greatest effect on breast cancer mortality reduction in the age group of 50-69 years [19]. Another study claimed that early detection through mammography decreases breast

cancer mortality by up to 25% [22]. It is claimed that the promotion of screening by mammography for women between the ages of 40-49 years results in increased low-grade detections, decreased treatments, and decreased recurrence rates [23]. These findings may be applied to the population of this study, which reported an alarming fraction (51%) of the cases as being under the age of 50. In addition to this, continuous awareness campaigns, the promotion of self-breast examinations from age 20, and biennial clinical breast exams should be encouraged.

The limitation of the study was the chosen surveillance medium used to identify the cases of breast cancer in Grenada. The study only reported cases that were identified through breast tissue biopsy and histological examination at the Pathology Department in the General Hospital, Grenada. Consequently, many cases were excluded from participation. Therefore, this would have affected the trend (person/place/time) analysis and resulted in an under-estimation of the true burden of breast cancer in the population.

ACKNOWLEDGMENTS

We are grateful to Dr. Barrymore Mcbarnette, Chief Oncologist at the Grenada General Hospital for all the assistance given to facilitate the data collection process. We would like to acknowledge Dr. Hegamin-Younger for her contribution to the statistical analysis. Finally, we would like to extend our appreciation to Dr. Scarlett Stuart, who offered advice on the basis of her medical expertise and passion for the study of Breast cancer.

ABSTRACT

Prostate cancer is the second most commonly diagnosed cancer in men worldwide, with countries such as the United States showing a higher incidence of prostate cancer in African American men. Studies performed in neighboring Caribbean countries show a high incidence of prostate cancer. Grenada is a small island country in the Caribbean with a population that is predominantly of African descent. Currently, there is limited data regarding the burden of prostate cancer in Grenada. This chapter seeks to determine the incidence, distribution, and mortality rate of prostate cancer in Grenada from 2008-2014. A cross-sectional study was performed utilizing secondary surveillance data available from national registries. Analytical software was used to determine the incidence, mortality, and distribution of cases by parish in Grenada during the period of study. Local incidence rate was as high as 91.03/100,000 (average 70.1/100,000). Mortality rate averaged 83.4/100,000. St. John was the parish with the highest recorded rate of 210/100,000 during the study period, with the parishes St. George and St. John having the highest overall 7-year average. Grenada has incidence levels comparable to Caribbean regional figures. There were higher mortality rates than expected. The geographical

* Corresponding Author's Email: ekeku@sgu.edu.

distribution of cases shows the parish of St. John having the highest individual incidence rate during the period.

INTRODUCTION

Grenada is a tri-island nation consisting of Grenada, Carriacou, and Petite Martinique. It has a population of 105,539 people, 53,008 male, and approximately 89.4% of African ancestry [1]. Since the end of the 18th century, the vast majority of the population in the Caribbean region is of African descent [2]. The ethnic profile of a geographical region is important to consider when examining disease rates. Prostate cancer has an increased incidence in African American men in the United States, and similar trends are seen in the mortality rate trends during the past 15 years [3]. Worldwide, prostate cancer is the second most commonly diagnosed cancer in men in over 12 of the planet's most populated nations [4]. In fact, there were 1.1 million men worldwide who were diagnosed with prostate cancer in 2012 alone [5].

Before the advent of screening using prostate-specific antigen (PSA) testing, prostate cancer often went undiagnosed and, therefore, untreated. When PSA testing became more commonly used, the rate of diagnosed prostate cancer began to spike [6]. This increase in the number of identified cases was seen in the US during the 1980s; it was also corroborated by similar rises in the incidence of many European countries during the 1990s [4].

According to a study done recently in Barbados, the Caribbean region generally has similarly high rates of prostate cancer in its black populations [7]. In fact, Martinique, which is another Caribbean country with similar ethnic profile, had the highest rate of prostate cancer worldwide in 2011 [8]. There are also four other Caribbean countries ranked in the top twenty highest prostate cancer incidence rates worldwide, which include Trinidad and Tobago, Barbados, Guadeloupe, and Puerto Rico [9].

According to the National Vital Statistics System, cancer was the number one cause of death among men and women in 2014. In relation to morbidity, prostate cancer has the highest rates; however, prostate cancer was the third most commonly diagnosed after cervical cancer and breast cancer, respectively [10]. A study conducted by Asulin et al. revealed that between the years 1990-2000, prostate cancer accounted for 61.4% of the male cancer cases and 53.6% of the cases associated with mortality [11].

Studies have shown that men are less likely to visit their doctor than women [12], and as such, it is quite often that cancer has already progressed to an advanced stage by the time it is diagnosed [13]. This would have more of an impact on mortality than an early diagnosis potentially would. The authors of this paper noted a lack of research on prostate cancer in Grenada over the past 15 years. Other cancers, such as cervical and breast cancer, have both been investigated within the past five years [10].

The goal of this chapter is to perform a review of prostate cancer trends in Grenada within the last seven years with the hope of contributing to future interventions to decrease its impact. The specific objectives were to identify the incidence of prostate cancer in Grenada within the last seven years (2008-2014); to identify the mortality of prostate cancer in Grenada during the years (2009-2013) and to determine the distribution, by parish, of prostate cancer incidence and mortality in Grenada (2009-2014).

OUR STUDY

A cross-sectional study was conducted utilizing secondary information derived from the National Cancer Registry, the National Statistics Office, and the Births and Deaths Registry. The analysis of the data was conducted utilizing the software: Microsoft Excel 2016, Epi Info7, and IBM SPSS Statistics 20.

The three existing resources were reviewed for data on prostate cancer during the period extending from 2008-2014. Data from the National Cancer Registry was used to determine the number of prostate cancer cases over that 7-year period among the male population of Grenada. That value was subsequently used to calculate the incidence rate per 100,000 of the male population. A case was defined as a male patient entered into the National Cancer Registry with a diagnosis of prostate cancer with corresponding histopathological confirmation. The age standardization rate was also calculated (ASR).

The National Cancer Registry also provided geographical information permitting the categorization of the cases by parish in Grenada. Grenada has seven parishes: Carriacou, St. Andrew, St. David, St. George, St. John, St. Mark, and St. Patrick. The Grenada Births and Deaths Registry was consulted in order to determine the deaths between the years 2009-2013 due to prostate cancer. The cases in which prostate cancer was the primary cause of death were included in this study.

FINDINGS

The data for prostate cancer incidence was collected from the period between January 2008 and December 2014. During this time period, 263 men were diagnosed with prostate cancer with a histopathological confirmation. The collection period for the data on the mortality rate of prostate cancer was January 2009 to December 2013. During this time period, there were 200 recorded deaths in which prostate cancer was the primary cause. Table 1 reports the distribution of new diagnoses of prostate cancer each year from 2008-2014. The distribution showed that 2014 had the highest frequency, with 50 new cases (19.1%) that year, closely followed by 2008, which had 39 new cases (14.8%). 2013 had the lowest frequency with 23 new cases (8.7%). Table 1 and Figure 1 also show the distribution of prostate cancer cases according to parish in Grenada. The parish of St. George had the greatest proportion of cases with 117 cases (44.5%). It was followed by the parish of St. Andrew with 19.8% of the cases (52). St. Mark and Carriacou had the lowest proportion of cases over the collection period with 4.2% and 4.9%, respectively.

Figure 2 shows the distribution of new prostate cancer cases by age group. The 71-75 year age group has the highest occurrence of new cases over the collection period, with the 61-65 age group having the second highest number of new cases of prostate cancer. The age group with the lowest number of cases was 31-35 years, with just one case in 2014, which was the year with the highest incidence overall. This patient was diagnosed at age 32 years. The average age for diagnosis of prostate cancer in Grenada during this period was 68–72 years, which was also the most commonly occurring age in the data set. Figure 3 and Table 2 present the deaths attributed to prostate cancer in the study period 2009-2013. The number of deaths from prostate cancer showed a progressive increase with age until it peaked and then

declined. The age group, which had the most prostate-related deaths, was 71-75, which is also where we saw most of the new cases. The mean age of death primarily due to prostate cancer is around 76.7 years, with 78 years being the most common age of death; similar trends for prostate cancer mortality appear in the UK [7] as well as in the United States [8].

Table 1. The frequency of new prostate cancer cases by year 2008-2014 and by parish

Figure 4 presents the incidence of prostate cancer per 100,000 as it compares to the mortality rate. Unlike what is seen in the US [8], but similar to the trend in Barbados [9], the mortality rate appears to be relatively high and has surpassed the incidence rate from 2010-

2013. The highest incidence seen was in 2014 (91.03), with the lowest rate noted in 2013(41.87). The highest mortality rate was in 2010 (83.35), which then declined to the lowest rate in 2013 (65.54). Figure 5 shows the age-specific incidence of prostate cancer for the Grenadian male population as it compares to the US population of African American men and the overall incidence in the US. In all cases, the age group of 65-74 years had the highest incidence. The incidence in the US nearly doubled the incidence in Grenada. Of all the cases, the 20-49 year age group has the fewest cases among all the countries whose populations were compared. The population standardized incidence rate of Grenadian men when calculated according to the Surveillance, Epidemiology and End Results (SEER) US 2000 population was 60.47, though, among Grenadian men, it averaged 70.89 and was as high as 91.03 in 2014. The incidence in Grenada is lower than the Barbadian incidence rate over the 2002-2008 study period (158.80) [9].

Figure 4. Prostate cancer in Grenada, incidence (2008-2014) vs. mortality (2009-2013).

*Population standardization was not done to US 2000 population as the other regional and US Black population were seen as sufficiently similar not to warrant it.

Figure 5. Age specific incidence of prostate cancer in Grenada (2008-2014) * Barbados (2002-2008) and US (2006-2012).

Figure 6. Distribution of incidence rates by parish between 2008-2014.

Figure 7. Distribution of prostate cancer incidence rates (2008-2014) and mortality rates (2009-2013) by parish in Grenada.

Figure 6 shows the incidence rate throughout the 7-year study period with respect to the seven parishes in Grenada (per 100,000). The highest recorded incidence during this period was in the parish of St. John in 2010, which was as high as 208.48; this is about three times higher than the national rate during that year. St. John retained the highest incidence rate for three consecutive years (2009-2011) and again in 2014. St. George had the highest rate in 2008 (112.42), Carriacou in 2011 (105.67), and St. Mark in 2013 (132.5) despite having two years without any cases (2010, 2011). Figure 7 shows a graphical representation of the distribution of the cases by parishes over the 7-year period. St. George had the highest number of cases of prostate cancer (117), and St. Andrew had the second highest (52 days). St. Mark had the lowest number of cases [11].

DISCUSSION

A prostate cancer registry was first established in Grenada by Dr. Robert Yearwood, and from 1996-2007 reportedly, it had recorded 300 cases of prostate cancer [8]. Grenadian males, during the seven-year study period from 2008-2014, had a total of 263 incident cases. Grenada's incidence per 100,000 for prostate cancer in its male population had an incidence rate in 2014 was 91.03/100,000. During the 7-year study period, the average incidence was 70.1. According to the World Cancer Research Fund (WCRF), the incidence rate recorded in Grenada in both 2009 and 2014 (91.05 and 91.03 /100,000 respectively), would place Grenada as having the 18th highest incidence of prostate cancer globally [5].

The 2004 study conducted in Grenada by Asulin et al., which was done between 1990-2000, recorded an incidence rate of 61.4 /100,000, which was lower than our currently recorded national 7-year incidence rate. This implies that there has been an increase in the number of new cases over the past 14 years in Grenada. According to the study by Gibson et al. from 1998-2002, the average incidence in Jamaica was 65.6/100,000, which was still lower than the 7-year average in our study in Grenada [11].

The Grenadian incidence rate over the collection period was still lower than that recorded in Barbados by Hennis et al. [7] in 2011, which was 160.4/100,000 for their 7-year study between 2002-2008. This rate ranked Barbados as number 4 by the WCRF [5]. The trend between 2009-2013 showed a decrease in the prostate cancer incidence rates in Grenada from 91.05/100,000 to 41.87/100,000, which was similar to the pattern shown in the US rates according to SEER for that time period (2009-2012). During that period, black Americans showed an incidence rate that was higher at 223.7/100,000 [8]. However, Grenada showed a rise in its incidence rates once again up to 91.03/100,000 in 2014. The mortality rate for prostate cancer between 2009-2013 was 83.4/100,000. This rate was higher than the incidence rate between 2010-2013, a trend that was not seen in the other compared populations in the region or amongst African Americans in the US [11].

The rate in the previous study done in Grenada was lower at 53.6/100,000. This mortality rate was also higher than the 7-year average incidence in Barbados of 63.7/100,000 and in African Americans in the US of 82.7/100,000. It is suspected that this difference may be attributed to the limited screening and treatment options currently available in the country. Additionally, it was observed in a previous study that male patients tend to visit their doctors

less frequently than females resulting in diagnoses occurring at a more advanced stage of cancer [4].

The parishes with the highest individual 7-year average incidence rates were St. George, St. John, St. Mark, and Carriacou, respectively (98.90, 89.35, 69.41 and 69.42 per-100,000). These parishes all share the western coast of the Caribbean Sea. As far as the author of this study is currently aware, there is no comparative study done in the Caribbean, which considers the distribution of prostate cancer incidence rates by location with which this finding can be compared. Strengths in the study are:

- Histopathological confirmation is the most accurate form of definitive prostate cancer diagnosis.
- Use of a functional cancer registry.
- Use of updated census data (2011)
- Regional comparisons to recently conducted studies.

Weaknesses in the study are:

- Loss of data: There is a private urology practice on the island, which occasionally sends patients to external diagnosis labs outside of Grenada. These patients were not included in the data from the hospital pathology laboratory, making the true incidence rates slightly higher than those reported.
- Co-morbidities are not always considered in the cause of death. For our study, the morbidity figures were compiled from prostate cancer being either a definitive or a probable cause of death.
- Undocumented cases may contribute to reduced prostate cancer diagnoses. As discussed in the paper, men tend to neglect visiting their physicians, which may contribute to unreported cases. Along with this, a lack of screening in specific age groups could contribute to the undocumented cases.

In conclusion, prostate cancer incidence rates in Grenada are overall trending high compared to other regional rates. Prostate cancer mortality was higher than expected; in some years, it was higher than the incidence rate. The distribution of prostate cancer by parish shows higher incidences in the parish of St. John and all of the other west coast (Caribbean Sea) parishes. Further studies are needed to formulate and investigate hypotheses to explain and corroborate some of these findings. In addition, major public health concerns have been raised in terms of the high local incidence rates as well as the geographical distribution of the cases. These also need to be addressed.

ABSTRACT

The prevalence of limb amputation related to peripheral arterial disease (PAD) and diabetes has attracted global attention as a major health problem. Recently published studies, however, are virtually absent on diabetes foot and lower limb complications in the Caribbean region. A retrospective descriptive study was conducted in Grenada, a small Caribbean island, with secondary data from January 2010 to December 2017 of patients having amputations at the Grenada General Hospital. Data on demographics, reason for amputation, type of amputation, and comorbidities were also collected in the study. A total of 654 persons were recorded that had an amputation at the General Hospital; 370 (56.6%) males, 284 (43.4%) females, and median age 64 years (<1 to 105 years). The overall annual incidence of amputations ranged from 50.5 to 102.4 per 100,000 per year. Lower limb amputations ranged from 39.0 to 87.8 per 100,000 per year. Diabetes was comorbidity in 51.1% of amputations. Amputations can have negative effects on the quality of life of individuals. With indications of a potential global increase in the number of persons with diabetes, effective and timely diabetes prevention and management programs are of utmost importance in Grenada to address risk factors for amputations. Other Caribbean countries may benefit from this study, which creates awareness of the significance of the issue and the relevance for interventions to improve health outcomes in the region.

INTRODUCTION

The prevalence of limb amputation related to peripheral arterial disease (PAD) and diabetes has attracted global attention as a major health problem [1]. An amputation is the removal of part of, or an entire, limb by surgery or trauma. Diabetes can cause microvascular and macrovascular complications that compromise immune response and blood circulation in the limbs resulting in the need for amputation to preserve life and health [2]. Worldwide, between 40-60 million people are affected by diabetic foot and lower limb complications [3]. Data from 12 countries in Europe and Australasia participating in the VASCUNET collaboration show the prevalence of diabetes among people who had amputations ranged from 25.7% in Finland to 74.3% in Slovakia, while the mean annual incidence of major amputations varied between 7.2/100,000 in New Zealand and 41.4/100 in Hungary [1]. In a study in Canada, 81% of persons who had a lower limb amputated also had diabetic complications [4]. In the United States, the Centers for Disease Control and Prevention (CDC) reported a decline in leg and foot amputations among people with diabetes from 1996-2008 [5]; however, a recent study reported a reverse in the trend between 2009-2015 [6]. The CDC reported that 108,000 diabetes-related amputations were done in 2014 [7]. The likelihood of having an amputation related to diabetes increased 4.9 times among people ≥ 65 years [1].

Overall, the risk for lower limb amputation is 10-fold higher among people with diabetes as compared to non-diabetic people [8], rendering diabetes as a significant cause of amputation and needing interventions for preventing the surgery. Lower limb amputation is the most common type of amputation among people with diabetes, while upper limb amputation related to diabetes is significantly fewer and usually associated with traumatic injury [8]. Limb amputation is associated with emotional disturbances and trauma as well significant decline in the quality of life of the individual, particularly when there is minimal support to provide for basic needs and to access appropriate health care [9]. High mortality rate, comorbidities, and high health care cost are major issues that contribute to poor health outcomes among people who had amputations [8].

This study describes the trends in amputations at the General Hospital in Grenada over eight years, 2010–2017. Grenada is a small island located in the southern part of the Caribbean archipelago, with a population of approximately 111,500 people. Few studies have been published recently on the prevalence and incidence of diabetic foot and limb complications and amputations in Caribbean countries. Older studies show an increasing rate of diabetes and related health problems, including amputations, in some Caribbean countries [10]. In a study published in 2004, Barbados had among the highest rate of lower extremity amputations in the world [10]. This study is, therefore, of value in determining the prevalence and potential impact of amputation in the Grenadian population. Other Caribbean countries may benefit from this study, which creates awareness of the significance of the issue and the relevance for interventions to improve health outcomes in the region.

OUR STUDY

A descriptive retrospective study was conducted using secondary data collected for the surveillance of amputations performed at Grenada General Hospital from the period 1st January 2010 to 31st December 2017. Grenada General Hospital is the main general medical and public surgical hospital in the state. It is the final referral hospital for both the public and private health sectors. It is a 198-bed facility, and the services offered include; accident and emergency, internal medicine, pediatrics, general surgery, obstetrics and gynecology, intensive care, ophthalmology, orthopedics, oncology, radiology, and laboratory services.

The Epidemiology and Information Department of the Ministry of Health routinely collects data on amputation as part of its surveillance of all health events in the country. Data on amputations were gathered from the paper-based operating theatre and surgical ward registers. A descriptive analysis of these data was undertaken to characterize the occurrence of amputations in Grenada.

The data elements selected for analysis included age, sex, parish of residence, dates of admission and discharge, reason for amputation, type of amputation, and comorbidities. The data were entered into a Microsoft Excel spreadsheet and analyzed to identify trends in the occurrence of amputations and the frequency of accompanying comorbidities.

OUR FINDINGS

A total of 654 patients underwent one or more amputations at the General Hospital during the study period. Of that total, 370 (56.6%) were male, and 284 (43.4%) were female. The average age of the patients who had amputations varied by year, ranging from 63.2-65.9 years in 2011-2017. In 2010, the average age was 56.3 years. Table 1 shows the distribution of patients by sex.

The parish with the largest proportion of cases over the eight-year period was St. George (32.1%), followed by St Andrew (17.9%). The years with the highest incidence of amputations were 2012 (91.1/100,00), 2014 (102.4/100,000), and 2016 (90.2/100,000). Tables 2-3 show the parish/residence of the patients having amputations and incidence per year.

Type of Amputation and Diagnosis

Overall, lower limb amputation was the most common type of amputation at the Grenada General Hospital. Below-knee amputation (BKA) was the most frequent procedure (281, 42.8%) followed by removal of toes and above-knee amputation (AKA). Upper limb amputation was more common in males and individuals in younger age groups. Loss of finger(s)/hand was more common than amputation at the forearm or arm. The most common reason for amputations in the upper limbs was injury. Tables 4-6 show the total number of amputations and the type and cause of upper limb amputations.

Cancer	1	1.3	-	-
Other	-	-	1	14.3
Total	79	100.0	7	100.0

A total of 152 toe amputations were recorded, which represented 23.2% of the total. The highest number of toe amputations was in 2015 [23] and 2016 [25].

The number of partial foot (trans metatarsal) amputations was 24 (3.7%) in total. The highest number of these procedures was in 2014 and 2015 with seven [7] and eight [8] cases, respectively. Below-knee amputations were the most common type of lower limb amputation with a total of 281 (42.8%) procedures during the eight-year period. The largest number of below-knee amputations were recorded in 2014 [49] and 2016 [47]. A total of 113 (17.2%) above-knee amputations were recorded during the eight-year period, with the highest number in 2014 [28] and 2016 [24]. Gangrene was listed as the most common reason for toe, below-knee, and above-knee amputations, while infections were the most common reason for partial foot amputations. Tables 7-8 show the number, type, and cause of lower limb amputations.

Comorbidities

Of the 656 amputations, 335 (51.1%) patients had diabetes, 107 (16.3%) had hypertension, and 33 (5.0%) had peripheral vascular disease recorded as comorbidity. The highest proportion of amputations was of the lower extremities among patients with diabetes as a comorbidity. Table 9 shows comorbidities in patients that had amputations by gender. Table 10 shows the number of amputations in patients with diabetes.

DISCUSSION

The rising prevalence of noncommunicable diseases is a global problem that has negative implications for small island states, such as Grenada and the other Caribbean islands, with limited and stretched resources for health care systems. Few recent studies have been published, estimating the prevalence and incidence of diabetes foot and limb complications and amputations in Caribbean countries. In the absence of collecting and analyzing data, a dearth may remain in recognizing and understanding the “true” burden of amputation on the population and the health care system. This study is among the first in Grenada to provide information showing trends in the incidence of all types of amputations in the recent period. Given the scantiness of recently published information, this study may also create awareness of the significance of the issue in the Caribbean region and spur heightened action to address the risk factors, primarily diabetes, and peripheral arterial disease.

The findings in this study were consistent with that of other countries. Among 12 countries in Europe and Australasia, between 25-75% of persons who had amputations also had diabetes [1]. It was found that 50% of the persons in Grenada who had an amputation during the reporting period also had diabetes. This pattern affirms the value of strengthening diabetes prevention and management programs as important interventions towards curbing the number of amputations. The data in Grenada is suggestive of the possibility of having prevented about half of the amputations.

Additionally, as in other international countries, the incidence of lower limb amputation in Grenada was significantly higher than upper limb amputations. Owing to the high incidence, preventive interventions should also be streamlined to address the specific risk factors for lower limb amputation.

Behrendt et al. [5] reported that people above 65 years in the United States were at higher risk for amputation. In Grenada, the average age of the persons who had amputations ranged from 63.2-65.9 years in the latter seven years of reporting. In the first reporting year, the average age was 56.3 years. While older people are more likely to experience poor health, having an amputation can significantly decrease the quality of life for the individual. Given that average life expectancy in Grenada is approximately 71 years, having an amputation translates into prolonged years of disability. The health, economic, and emotional consequences may be more dire after retirement when the individual has less access to financial resources for care and likely to become dependent on others. In 2004, a study was published citing diabetes foot care was a problem in Barbados and that the country had among the highest rate of lower extremity amputations in the world [10]. Limited access to prosthetic devices and rehabilitation services in the region were also deemed to increase hardship for persons who had amputations [10]. These conditions may not have improved much in the Caribbean region, particularly, as data is also lacking to highlight the extent of this problem and the need for redress.

Currently, there is no national or community-based program in Grenada to provide psychosocial and other support for people who had amputations. Additionally, until the National Health Insurance (NHI) is commissioned in Grenada, older people, in particular, may be confronted with a high cost for health services, particularly for services provided at private facilities. Behrendt et al. (2018) found that countries with fee-for-service reimbursement had a lower incidence of major amputations compared to a higher incidence in countries with population-based reimbursement system. This finding shows a potentially important function of the NHI in the management of major amputations. Driven by financial reward, a fee-for-service- system may serve to motivate health care workers to provide high quality care for patients to prevent or to reduce the risk for amputation. Serious consideration should, therefore, be given to ensure the NHI facilitates adequate preventive care for Grenadians.

The results show a higher incidence of upper limb amputation among men in Grenada with injury as the major cause. There was less variability between the number of men and women who had lower limb amputations, highlighting the need for prevention and care equally for both genders. Geiss et al. [5] found the number of persons, particularly aged 18-64 years (young and middle-aged adults), who had amputations in the United States increased between 2009-2015 compared to the CDC's findings for 1996-2008 [5]. The trends in the United States and in Grenada suggest the need for all age groups and genders to be targeted by interventions, rather than selected groups. In Brazil, Santos [11] found that men lived longer following amputation, losing more years of healthy life. Healthy life expectancy must be considered in planning with the aim of improving the quality of life for men who had amputations and ensuring that adequate services are provided, including health education [11].

Global data and projections do not give reassurance for a decrease in amputations. The World Health Organization (WHO) estimates show that about 422 million people were affected by diabetes in 2014, rising from 108 million in 1980 [12]. The number of people with

diabetes worldwide has increased steadily, and the number is expected to continue to rise [8]. PAD, the other main cause of amputation, has affected an increasing number of people, estimated at 202 million [1]. Considering the high and increasing prevalence of noncommunicable diseases in Grenada and other Caribbean countries [13, 14], not only are appropriate measures needed to prevent and manage diabetes, but these measures need to be implemented in a timely manner. While the number of amputations may appear insignificant, the overall social and economic burden is huge, extending to family and community members. Retrofitting physical infrastructure and social adjustments may also incur a significant burden on society.

Based on human rights, deliberate efforts should be made to relieve the trauma and discomfort associated with illness. Traumatic experiences may persist for several months after an amputation. Quite often, persons having amputations, especially those of the lower limbs, are pitied and/or stigmatized and, as such, the individual may withdraw from the society and normal functions. In the absence of adequate rehabilitation services, the level of the disability created by the amputation is magnified. Support groups and networks may serve an important role in rehabilitation and reintegration in the society of people who had amputations. The physical and social infrastructure must also be adequate for use by people with disabilities.

Recent publications on diabetes complications and amputation in the Caribbean are virtually non-existent. In the absence of data, there may not be sufficient understanding of the significance of amputation on the population health outcomes. The need for strengthening current interventions may not be sufficiently highlighted. As such, this study is useful to address the information gap to inform policy and interventions in Grenada. Other Caribbean countries may benefit from this study, which creates awareness of the significance of the issue and the relevance for Caribbean population health outcomes. Amputation can have serious effects on quality of life and may also put a strain on resources to make adjustments to accommodate persons with severe disabilities. These burdens, however, can be managed through the timely implementation of appropriate measures to address risk factors. Finally, Behrendt et al. [1] suggest that countries should also focus on improving data collection and analysis of amputation procedures and results, ensuring standardization of procedural and diagnosis codes with international protocols.

ACKNOWLEDGMENTS

The authors thank the Ministry of Health, Social Security, and International Business for providing access to the data; particularly the staff at the Epidemiology and Information Department. The staff at the General Hospital is also specially thanked for collecting and inputting the data in the registers. Funding was not provided by any institution for this study. The authors declare that they have no conflict of interest. Informed consent was obtained from each individual participant involved in this study. This study was conducted in accordance with the 1964 Declaration of Helsinki and its subsequent amendments.

Chapter 96

HAZARD AND RISK ASSESSMENT OF RAINWATER HARVESTING SYSTEMS IN CARRIACOU, GRENADA

Lindonne Glasgow*, MSPH, DrPH and Jeremy Mendes, BSc

Department of Public Health and Preventive Medicine,
St. George's University, St. George's, Grenada, West Indies

ABSTRACT

The structure and operation of 20 rainwater harvesting systems in households in Carriacou were observed to identify hazards and estimate the risk associated with the systems. A semi-qualitative assessment methodology was adopted from the World Health Organization and International Water Association Water Safety Plan Manual. A matrix was used to calculate risk scores based on the frequency and severity of hazardous events. This study focused on three types of hazards: physical (esthetics), chemical and microbial. The observations were conducted in June, 2019. Of the nine parameters assessed, more than 50% of the 15 concrete tanks received high to very high scores in six areas. More than 50% of the five plastic tanks also received high to very high scores in six areas. When the overall risk score was calculated, three systems received low scores, ten systems received medium scores, and seven systems received high scores. Overall, the findings are indicative of moderate risk associated with rainwater harvesting systems in households in Carriacou. Public health safety can be improved through educating householders, regular monitoring of the systems, and enforcement of safety measures, such as first flush devices and filters. These findings can be applied to develop guidelines for the replication of rainwater harvesting technology on the mainland in Grenada.

INTRODUCTION

Rainwater harvesting is well recognized for obtaining potable water in many countries [1]. The technology is commonly used in dry areas and where surface water is virtually non-

* Corresponding Author's Email: lglasgow@sgu.com.

existent. Harvested rainwater is also used to supplement municipal supplies with the additional benefits of risk substitution, low service and maintenance cost, and quality service [1, 2]. The technology is considered environmentally friendly, reducing runoff that can cause flooding and soil erosion [3].

Rainwater harvesting is significant for public health [4]. Harvested rainwater can become contaminated at several points along the system – catchment, conveyance, storage - up to levels that exceed recommended guidelines. Microbial contamination of the water can result in significant health problems; usually, severe diarrhea and vomiting, leading to other secondary problems and death, particularly in young children [5]. Poor sanitation in the environment is a major factor that contributes to high bacterial concentration in rainwater systems [6, 7]. Failing to treat harvested rainwater, such as by application of chlorine tablets, and improper installation of safety devices, such as for first flush diversion and filtering debris from the water, also make the systems prone to contamination [7]. Contaminants, such as chemicals and microorganisms, can enter stored rainwater from soils through cracks in underground tanks. The materials used to construct the system can also be hazardous, and leached into the water, posing a threat to human health from consumption of the water [8].

Although only a few major outbreaks of gastrointestinal illnesses were reported in Caribbean countries from the consumption of harvested rainwater, there were health challenges in some countries. Salmonella outbreaks were found to be associated with the consumption of rainwater in Trinidad and Jamaica [9]. In some situations, technical issues presented challenges in ensuring the systems were designed for safety and efficiency [10]. Another significant issue was the discovery of elevated levels of pollutants from African origin, including arsenic and pesticides, deposited in cisterns in the Caribbean region [11–13].

This research was conducted as a pilot study to identify hazards and estimate the risk associated with rainwater harvesting systems in Carriacou, a small dependency in the State of Grenada. The structure and operation of the systems were analyzed using a semi-qualitative matrix approach published by the World Health Organization (WHO) and the International Water Association [14]. Risk scores were calculated based on the frequency and severity of hazardous events associated with the location and operation of the systems. To our knowledge, this semi-qualitative matrix methodology has not been applied to conduct risk assessment in previous studies in Carriacou. The results from this study should allow for better streamlining of interventions to improve water safety in Carriacou and on the mainland in Grenada. The information can also be used to inform the designing of future research, with a wide range of variables, to get in-depth knowledge of the significance of rainwater harvesting for public health in Grenada and other Caribbean islands. Financial support for this study was provided by the Windward Island Research Foundation (WINDREF) at St. George's University in Grenada.

OUR STUDY

This research involved observations and assessment of rainwater harvesting systems in Carriacou in the State of Grenada to identify potential hazardous events and evaluate the risk related to those events. Two systems were randomly selected from among households in the larger communities and one system from among households in the smaller communities for

observation and evaluation. A total of 20 systems were included in this study. Four systems were in the communities in the southern part of the island, three systems in communities in the northern part, and 13 systems in communities in the central part of the island. Table 1 shows the community and number of systems included in the study.

Total	20

Observation and Evaluation

The approach for this study was adopted from the WHO and the International Water Association *Water Safety Plan Manual* [14]. Specific parameters were considered in the assessment and a matrix provided for calculating risk scores from potentially hazardous events based on the frequency of events and severity. This study focused on three types of hazards: physical (esthetics), chemical and microbial. The observations were conducted on June 29-30, 2019. Information on frequency and type of maintenance was deduced from a survey conducted in Carriacou in collaboration with the Caribbean Regional Pilot Program for Climate Resilience (PPCR). All other information for the assessment was deduced from the observations of the systems.

Evaluation and Calculation of Risk Scores

Table 2 shows the semi-quantitative matrix from the *WHO Water Safety Plan Manual* (2009). The likelihood/frequency of a hazardous event and the severity were both measured on a scale of 1-5. The likelihood of an event was ranked as rare (1 point), unlikely (2 points), moderate (3 points), likely – once a week (4 points) and almost certain – once a day (5 points). The severity was ranked as insignificant or no impact (1 point), minor compliance impact (2 points), moderate esthetic impact (3 points), major regulatory impact (4 points), catastrophic public health impact (5 points). The risk scores were derived from multiplying the number corresponding to the likely frequency of the event (3 monthly, 4 weekly, and 5

daily) by the hazard severity score for specific likely events (4 mosquito larvae/algae, 4 leaves and debris, 3 fine particulates, 4 light industrial activities, 2 traffic exhaust and dirt, 5 agrochemicals, 5 excreta from rats, bats, etc. dead animals, etc. in the catchment area, 5 excreta, urine from dogs, sheep, chickens, etc. on the compound, 5 sewage from septic tank/pit latrine).

Table 2. Semi-quantitative risk matrix approach for calculation and interpretation of risk score

		Severity or consequence				
		Insignificant or no impact - Rating: 1	Minor compliance impact - Rating: 2	Moderate aesthetic impact - Rating: 3	Major regulatory impact - Rating: 4	Catastrophic public health impact - Rating: 5
Likelihood or frequency	Almost certain / Once a day - Rating: 1	3	6	15	30	25
	Likely / Once a week - Rating: 2	4	8	12	16	20
	Moderate / Once a month - Rating: 3	5	6	9	12	15
	Unlikely / Once a year - Rating: 4	2	4	6	8	10
	Rare / Once every 5 years - Rating: 5	1	2	3	4	5
Risk score		<6	6-9	10-15	>15	
Risk rating		Low	Medium	High	Very high	

Source: WHO Water Safety Plan Manual (2009). Available at http://apps.who.int/iris/bitstream/handle/10665/75141/9789241562638_eng.pdf?sequence=1&isAllowed=y.

A maximum of 25 points was achievable, indicating that the highest level of risk was associated with the specific hazard. In cases where several hazardous events were present, the most regular frequency score was used in the calculation. A risk score <6 reflects low risk, 6-9 reflect medium risk, 10-15 reflect high risk, and >15 reflect very high risk. Table 3 shows the hazardous events and likelihood and severity scores used in calculating the overall risk scores for the systems in Carriacou.

FINDINGS

Of the 20 systems observed, five had plastic storage tanks, and 15 had concrete cisterns for storage, located fully or partially below ground level. Of the nine parameters, more than 50% of the 15 concrete tanks received high to very high risk score, attributable to six events (leaves and debris; fine particulates; chemicals from light industrial activities; chemicals from traffic exhaust; microbes in excreta and dead vectors (catchment area); and microbes from animal excreta and urine (tank area)). Of the nine parameters, more than 50% of the five tanks received high to very high risk score, attributable to seven events (mosquito/algae; leaves and debris; fine particulates; chemicals from light industrial activities; chemicals from traffic; chemical from agricultural activities; and microbes from excreta and dead animals (catchment area)). When the overall risk score was calculated, three systems received low risk scores, ten systems received medium risk scores, and seven systems received high risk scores. Table 4 shows the number of systems deriving specific risk scores for each event.

Table 3. Hazardous event, likelihood and severity scores used for calculating risk scores

Hazard	Severity Score	Events Frequency Score									
		1	2	3	4	5	6	7	8	9	10
		Windy	No filtering device	No first flush device	Crack in underground cistern	Concrete roof	No yearly maintenance of tank/filter/gutter	Mosquito larvae/algae	Animals on compound with cistern	Agriculture/ agrochemical use in vicinity	Catchment/ system close to road

DISCUSSION

For many years, the Caribbean Public Health Agency (CARPHA) and other public health agencies have encouraged the use of rainwater harvesting technology in Caribbean countries to augment municipal supplies and as a measure to mitigate climate change impacts in areas that are prone to water-stress [15–18]. Rainwater harvesting systems are, however, also highly susceptible to pollution from various sources and have implications for public health when the contaminated water is consumed. In the study in Carriacou, there was moderate public health risk associated with consuming water from the systems, which received a mixture of high, very high a low scores attributable to specific hazard and likely frequency of the events. Half of the systems received overall scores in the category of medium risk. A medium-level risk score indicates a moderate presence of environmental factors that have the potential to compromise the quality of harvested rainwater, and that could affect human health. The presence and effect of those factors may vary by season. For example, during the dry season, due to windier conditions and low volume of water in tanks, there may be an elevation in the concentration of pollutants. According to the WHO, weather, chemicals, microorganisms, and organic matter can have mild to significant impacts on the quality of harvested rainwater [1].

A few systems did not have filters to prevent the entry of pollutants into storage tanks. Diversion of the first set of water was also not commonly practiced. In the absence of filters/mesh and first flush devices, debris can be easily transported into tanks and

compromise the physical, chemical, and microbial quality of the water. Organic matter facilitates the growth of microorganisms, protect organisms from the effects of disinfection, and increase the demand for chlorine in water [8]. Concrete roof, which was present in some households in Carriacou, is usually flatter than galvanize roof and favors lodgment and buildup of particulates on the uneven surface. Dissolved solids can increase the turbidity of the water and affect the taste and appearance. Systems that do not contain filters or first flush devices are more prone to changes in the quality of water from weather events. The WHO encouraged the use of effective devices to minimize the entry of organic matter into harvested rainwater, as well as the practice of regular maintenance of systems and disinfection of the water [8].

Fishing is the dominant livelihood in Carriacou. The island is also well known for its boat building trade. Many chemicals that are toxic to humans are used in the construction of boats. Carriacou is windy, and chemicals can be easily transported to water collection surfaces and later washed into the storage tanks. On the small island, applying pesticides in residential areas by spraying also increases the potential for chemical pollution of the water. The concentration of pollutants may be lower in the wet season due to the regular exchange of stored water. In the dry season, however, the concentration of pollutants may be elevated due to the low volume of water present in the tanks. The deposition of chemical pollutants from African origin, carried in dust blows that typically occur in the dry season, and detected in water tanks in the Caribbean [11–13] is proof that large quantities of particulates can be transported in the wind and accumulate to levels that may pose a risk to human health. Health problems such as cancer, neurological and developmental disorders, and irritation may result from exposure to toxic chemicals [19]. Residents should be encouraged to improve safety practices, including the installation of flush diversion valves. Flush systems can be manually operated and require human intervention for effective use in each rainy period. A more practical approach is to install an automated system that also requires low maintenance. An effective flush system can significantly reduce pollutants in stored rainwater. This can eventually reduce the incidence of waterborne disease on the island, although the incidence is generally low in the wet season with an increase in the dry season.

Rearing livestock, poultry, and other domesticated animals such as cats and dogs in close vicinity to cisterns can constitute a biohazard for ingress of polluted groundwater into cracked tanks. Cats and rats can also climb onto catchment areas, such as on roofs, and deposit excreta which can introduce pathogens to rainwater systems. Animal fences were not commonly seen in Carriacou although animals were left untethered. This situation may increase the risk for transmission of disease-causing organisms from animal sources to humans. Salmonella outbreaks were found to be associated with the consumption of rainwater in Trinidad and Jamaica [9]. Zoonotic diseases can cause serious illnesses in humans and even death [20]. Precautions should be taken to prevent animals and animal waste in the immediate vicinity of rainwater harvesting systems.

This pilot study was conducted, including 20 systems in Carriacou. The small sample size is not representative of households in Carriacou, and the results of this study only provide an indication of some environmental factors that may have an impact on public health in Carriacou through the water sector. Further research is needed to understand better the magnitude and extent to which the events, identified in this study, affect the quality of the harvested rainwater. It is important to identify public health risks in the water sector in Caribbean countries for several reasons: water is becoming scarce as a direct consequence of

climate change [15]; rainwater harvesting systems are increasingly used as a source for potable water, globally and in the Caribbean [1, 10]; waterborne diseases account for a significant burden on the health care systems in the region [21, 22]; and the region, comprising mostly of small island states, has limited resources to combat waterborne infectious diseases.

Other countries, such as Antigua, Barbuda, St. Lucia, and Barbados, in which rainwater harvesting is a common practice, may benefit from this pilot study to guide water quality studies. This study can be used as a reference to inform steps to improve water safety in the most precarious situations. Irrespective of the countries in which studies are conducted, it is beneficial to share data and technical resources to strengthen the capacities for monitoring rainwater harvesting systems in the Caribbean region. Finally, agencies such as CARPHA, the Pan American Health Organization (PAHO) and the Caribbean Development Bank (CDB) should collaborate with regional governments and local organizations to mobilize and provide resources for the introduction of new technologies in the region and to improve water safety for the Caribbean people.

ACKNOWLEDGMENTS

The authors are grateful to St George's University, the Windward Island Research Foundation (WINDREF), and the Produce Chemical Laboratory in Grenada for their various support for this study. Funding for this study was provided by the Windward Island Research Foundation (WINDREF), Small Research Grant Initiative (#SRGI 19004). The authors declare that they have no conflict of interest. Informed consent was obtained from each individual participant involved in this study. This study was conducted in accordance with the 1964 Declaration of Helsinki and its subsequent amendments.

KNOWLEDGE, ATTITUDES AND PRACTICES REGARDING RAINWATER HARVESTING IN CARRIACOU, GRENADA

Lindonne Glasgow*, MSPH, DrPH and Jeremy Mendes, BSc

Department of Public Health and Preventive Medicine,
St George's University, St George's, Grenada, West Indies

ABSTRACT

Rainwater harvesting is well established in Carriacou, a small dependency island in the State of Grenada in the Caribbean. Owing to a high dependence on rainwater for domestic purposes, it is essential to regularly monitor practices and the quality of water on the island. This pilot study was conducted to assess the knowledge, attitudes, and practices of residents in 20 households in Carriacou. A survey was administered face to face to the residents in June, 2019. The survey questions led to the collection of information on household water supply, knowledge about and attitudes to rainwater harvesting, rainwater harvesting practices, and the use and treatment of rainwater for domestic purposes. Fifteen respondents stored water in concrete tanks, while five used plastic tanks for storage. The overwhelming majority of respondents stated they used the water for one or more of the following purposes: drinking, bathing, cooking, cleaning, flushing toilet, and washing vehicles. More than half of the respondents stated that water was always available from their household system. Eighteen respondents reported they did maintenance at least once per year. Four respondents did not have a mesh to filter the water entering the tank, and 16 respondents did not practice first flush diversion. Water safety education programs can be beneficial to improve rainwater harvesting practices in Carriacou. Monitoring practices and providing support for improvements may greatly benefit the water sector on the island and minimize the risk of waterborne illnesses.

INTRODUCTION

Rainwater harvesting is becoming more commonplace to augment municipal supplies. The technology is regarded as reliable to mitigate the impacts of climate change and with significant potential to reduce the risk of contracting pathogenic waterborne illnesses, particularly in areas where wastewater recycling is practiced [1, 2]. Rainwater harvesting is a common practice in the Caribbean countries, especially in Trinidad, Antigua and Barbuda, Tortola, Barbados, and the Bahamas. Increasingly, the need to collect and store water to maintain adequate supplies is recognized as the region experiences harsher and extended dry seasons [3–5]. About 500,000 Caribbean residents depend entirely or mostly on harvested rainwater to meet domestic, recreational, and agricultural water needs [6]. Although governments have taken steps to extend the supply of pipe-borne water in some countries, rainwater harvesting is also promoted as an environmentally friendly approach to supplement municipal supplies [7–9].

The points of collection, conveyance, and storage are susceptible to pollution. Wind and water can be vehicles to transport dust, chemicals, and bio-waste from the vicinity into the system. Studies have shown microbial and chemical pollution resulting from poor environmental sanitation and usage of hazardous construction materials for the systems [2, 10–12]. Additionally, discharges from industrial activities are significant sources of pollution from deposition on catchment areas and directly into storage tanks. In addition, studies have shown elevated levels of pollutants in cisterns in the Caribbean from trans-national sources, such as arsenic from dust blows originating from as far as the Sahara desert region in North Africa [13, 14].

Rainwater harvesting is the primary source of water in Carriacou, a small dependency island in the State of Grenada. Grenada is located in the southern part of the Caribbean. Approximately 5,000 persons reside in Carriacou. Surface water is virtually non-existent on the island, and it is not uncommon for most residents to experience a shortage of water during the dry season. The dry season typically lasts from January-June. During the dry season, there is an elevated risk of pollution from wind transportation. At the same time, the concentration of pollutants can build up faster in the small volume of water in storage tanks. Syndromic data from the Ministry of Health in Grenada show a consistent peak in the number of cases of diarrheal illness during the dry season each year [15], which may be indicative of the higher concentration of pollutants in water. The findings from the Burden of Illness (BOI) study in Grenada in 2008-2009 highlighted the need for closer monitoring of water safety practices, both on the mainland and in Carriacou and Petite Martinique.

This pilot study was conducted in partnership with the Caribbean Regional Pilot Program for Climate Resilience (PPCR) with a small sample of residents to investigate knowledge, attitude and practice (KAP) regarding rainwater harvesting in Carriacou. The regional project was designed to provide information on the feasibility and need for replicating rainwater harvesting technologies on the mainland in Grenada. In this study, we collected information on household water supply, knowledge about and attitudes to rainwater harvesting, rainwater harvesting practices, and the use and treatment of rainwater for domestic purposes. The study was conducted in the first month of the rainy season. The results of this study should inform future research with larger samples to obtain a more comprehensive understanding of the quality of water for potable uses. The findings also provide insights on some appropriate

interventions for water safety in Carriacou. Lastly, the findings will complement the PPCR to propose recommendations for safety in adopting rainwater harvesting technologies on the mainland, where communities also experience water shortage from pipe-borne sources during the dry season.

OUR STUDY

This pilot study was conducted with residents in 20 households across 15 communities in Carriacou. Two households were randomly selected in larger communities and one household in smaller communities. A total of four households were selected in the communities in the southern part of the island, three households in the communities in the northern part, and 13 households in communities in the central part of the island. The geographic spread in the sampling was representative of the number of communities and residents in the respective parts of the island. Table 1 shows the communities and number of households included in this pilot study.

Through the PPCR, a 3-day consultation was held in St. Lucia in March, 2019 to develop and test a questionnaire for use in the regional study in three Caribbean islands - Grenada, Jamaica, and St. Lucia. This questionnaire was modified slightly for use in the study in Carriacou. The modified questionnaire was further piloted with a small group, and the recommendations were incorporated to improve comprehension and answer choices suitable for the context on the island.

At the household level, one adult above 18 years, preferably the head of the household, was selected to participate. The survey was administered face to face by trained surveyors on June 29-30, 2019 in the first month of the rain season. Questions were included to collect information about household water supply, knowledge about and attitudes to rainwater harvesting, rainwater harvesting practices, and use and treatment of rainwater for domestic purposes. Participants were required to provide written consent before being interviewed. Responses were recorded on the questionnaire and later entered into a database for analysis.

Table 1. Number of households selected in each community in Carriacou for inclusion in the study

Community	Number of systems assessed

FINDINGS

Of the 20 respondents in the pilot study, 14 (70.0%) were males, and 6 (30.0%) were females. The majority of respondents (15, 75.0%) also identified themselves as the head of the households. Half (10, 50.0%) of the respondents were between 41-65 years, and more than half (12, 60.0%) had lived in the community for more than 26 years. The majority (14, 70.0%) of respondents lived in concrete houses, and 14 (70.0%) also had toilet facilities with a flush to septic tank system. Table 2 shows the demographic characteristics of the respondents.

Household Water Supply

Residents were asked about the main source of water for their households, disruptions, and alternative sources. Fifteen (75.0%) respondents reported a private concrete cistern was the main source of water for the household, while 5 (25.0%) reported a private plastic tank was used. More than half of the respondents (12, 60.0%) reported water was always available from the private supply, 6 (30.0%) stated water was available for most of the year, and 2 (10.0%) reported water was available for about half of the year or less. Nine (45.0%) respondents stated they had the most disruptions during the period of December to May. Of the respondents who experienced shortages during the year, 5 (55.5%) stated they sourced water from friends and neighbors as an alternative. About one-third of the respondents (6, 30.0%) stated their supply was more than adequate throughout the year, 10 (50.0%) stated adequate and 4 (20.0%) stated they experienced scarcity for the household.

Table 2. Demographic characteristics of the respondents

	Number	Percentage		Number	Percentage
Gender			Floor material		
Male	6	30.0	Dirt/Sand	0	0
Female	14	70.0	Wood	6	30.0

11-25	5	25.0	Bucket	0	0
26+	12	60.0	Bush/field	0	0

Rainwater Harvesting Practice

In reporting on the location of the storage facility, 19 respondents stated the facility was underground. Almost half of the respondents (9, 45.0%) reported they did not make preparations to secure their systems during the passage of a hurricane, storm or an earthquake; half (10, 50.0%) did not have a water line indicator in their system, and 4 (20.0%) did not have a mesh to filter the water entering the tank. The majority, 16 (80.0%), did not use a first flush system. A little more than half (12, 60.0%) of the respondents reported they treated the water before consumption; six added bleach, two added chlorine tablets, and three had small fishes to consume mosquitoes and larvae.

Only two (10.0%) respondents reported they used additional filtration or treatment methods after the water left the tank. Half of the respondents also stated they did not have a mesh to stop mosquitoes from going up into the pipes. Eighteen (90.0%) respondents reported they did maintenance or cleaning of the system. Table 3 shows the type and frequency of maintenance by respondents. Six (30.0%) respondents stated they felt they should do more maintenance while 13 (65.0%) felt they did not need to do additional maintenance.

Table 3. Frequency and type of maintenance performed by respondents

	Number	Percentage		Number	Percentage
Maintenance/cleaning			Clean Storage tank		
Yes	18	90.0	Every 5 years	1	5.0
No	2	10.0	Every 2 years	3	15.0
			Yearly	4	20.0
Maintenance			Dry season	6	35.0
Every 4-5 years	1	5.0	Twice yearly	1	5.0
Every 3 years	3	15.0	3-4 months	1	5.0
Every 2 years	2	10.0

Twice yearly	2	10.0	Yes	16	80.0
Occasionally	1	5.0	No	4	20.0
No response	2	10.0			
			Clean roof/gutters		
Clean storage tank			Every 2 years	8	40.0
Yes	18	90.0	Yearly	4	20.0
No	1	5.0	Dry season	1	5.0
			Twice yearly	1	5.0
			Every 3 months	1	5.0

Use and Appearance of Drinking Rainwater

The overwhelming majority of the respondents (19-20, 95.0-100%) reported they used the harvested rainwater for one or more of the following purposes: drinking, bathing, cooking as well as for cleaning, flushing toilet, and washing vehicles. Nine (45.0%) also used the water for lawns/gardens. Eighteen (90.0%) respondents stated the water tasted good, and a similar proportion felt it was safe for drinking. Sixteen (80.0%) respondents stated the water was clear during most of the year.

Knowledge and Attitude to Rainwater Harvesting

Respondents were asked to state their level of agreement with statements that demonstrate their knowledge and attitude to rainwater harvesting. The most variance in the responses was to the question of whether the government was responsible for providing residents in Carriacou with safe water. While six (30.0%) of respondents agree, only two (10.0%) strongly agreed, five (25.0%) neither agreed nor disagreed, and seven (35.0%) disagreed. The responses differed more significantly on the question of the safety of using chlorine to treat drinking water. Five (25.0%) respondents strongly agreed that chlorine was safe to treat the water, seven (35.0%) agreed, three (15.0%) were neutral, and five (25.0%) disagreed. There was also variance in the responses regarding the safety of water after diverting the first set from the tank. Almost half (9, 45.0%) of the respondents neither agreed nor disagreed that the water was safer from using a first flush system, seven (35.0%) disagreed and four (20.0%) respondents, in total, strongly agreed and agreed. Table 4 shows the respondents' agreement with the statements.

Table 4. Respondents level of agreement with statements regarding rainwater harvesting

	Number	Percentage		Number	Percentage
Untreated rainwater is safe to drink			Rainwater treated with bleach is safe to drink		
Strongly agree	3	15.0	Strongly agree	5	25.0
Agree	10	50.0	Agree	7	35.0
Neutral	3	15.0	Neutral	3	15.0
Disagree	4	20.0	Disagree	5	25.0
Strongly disagree	0	0	Strongly disagree	0	0
Diverting the first set or rainwater makes the water safe to drink			Untreated rainwater is safe for bathing		
Strongly agree	2	10.0	Strongly agree	10	50.0
Agree	2	10.0	Agree	7	35.0
Neutral	9	45.0	Neutral	3	15.0
Disagree	7	35.0	Disagree	0	0
Strongly disagree	0	0	Strongly disagree	0	0
Filtered rainwater is safe to drink			Untreated rainwater is safe for cooking		
Strongly agree	9	45.0	Strongly agree	8	40.0
Agree	8	40.0	Agree	12	60.0
Neutral	3	15.0	Neutral	0	0
Disagree	0	0	Disagree	0	0
Strongly disagree	0	0	Strongly disagree	0	0
Boiled rainwater is safe to drink			It is the responsibility of government to supply us with safe water		
Strongly agree	15	75.0	Strongly agree	2	10.0
Agree	4	20.0	Agree	6	30.0
Neutral	1	5.0	Neutral	5	25.0
Disagree	0	0	Disagree	7	35.0
Strongly disagree	0	0	Strongly disagree	0	0

DISCUSSION

Rainwater harvesting is considered a safe alternative to municipal water supplies having a lower risk of contamination from sources such as lead pipes and chemicals and microorganisms in recycled water [1]. Rainwater systems, however, are susceptible to microbial and chemical pollution, in particular [11, 16, 17]. Constant monitoring is necessary to ensure that a consistent and safe supply of water is available in communities that are prone to experience water stress. KAP studies can be beneficial to understand risk and inform appropriate interventions to improve water safety. The findings from the BOI study in 2008-2009 and other studies in Carriacou suggest there is a need for close monitoring of the rainwater harvesting systems.

The results of this study indicate there is some level of efficient management of water supply by residents in Carriacou, with about half of the respondents stating they had a consistent supply of water throughout the year. This study did not focus on the extent and practices related to the management of supply. In the context of climate change mitigation, the issue is important, relating to the efficiency of the technologies that are currently used versus alternative technologies. The results show extremely high dependency on rainwater for drinking, cooking, bathing, laundry, and cleaning. This high dependence on harvested rainwater shows, not only the social impact of the practices but also the public health implications relating to water quality in Carriacou.

While there was a general positive indication about the management of water supplies in households, about half of the respondents also stated their supply was only "adequate" with an additional 20.0% stating they experienced scarcity. Together, these statistics indicate a potentially high risk for water shortage by a significant segment of the Carriacouan population. Climate change exacerbates this challenge, calling to attention the need to monitor and manage the balance between water demand and supply. The size of households, rainfall patterns, and other factors should be given consideration in determining what systems are adequate for households. Currently, pipe-borne water is the main supply on the mainland in Grenada. In promoting the replication of rainwater harvesting on the mainland, it may be best to develop policies that support diligence in water supply and address the gaps found in this pilot study in Carriacou. This approach can ensure that the measure becomes an effective climate change mitigation strategy and attract long term use by a significant segment of the population.

There were notable differences in the responses regarding the government's responsibility for providing safe water for residents in Carriacou. Several factors may account for the differences, including individual perception about the need and influence of laws and policies to direct the management of individual and communal water supplies. In the absence of a structured program by the government that actively directs and monitors rainwater harvesting in Carriacou, residents are left to make choices regarding how they manage household supplies. This autonomy may translate into little understanding and appreciation of the government's responsibility for oversight of public health, which also extends into the water sector. The government's failure to construct a modern water system on the island at the time of the interview may be another reason for the mixed responses.

Governments have ultimate responsibility for public health [18], and their agencies should ensure water safety measures are implemented and maintained within their

jurisdictions. In the BOI study in 2008-2009, the third highest prevalence of acute gastrointestinal illness (AGI) was found in Carriacou and Petite Martinique [15]. Despite a few reports of major issues related to water consumption in the dependency islands, a monitoring system is still prudent to maintain a potable quality of water in all households on the island and to reduce the seasonal increases in AGI cases. Inconsistency in the responses regarding the use of chlorine for sterilization also shows a possible need for education and health promotion to demonstrate best practices in rainwater harvesting including the WHO recommended usage of chlorine tablets for sterilization [10], first flush system and filters or mesh to reduce the potential for pollution of water in storage tanks.

More than half of the residents reported they did not make preparations to prevent disruption of their water supply in the event of a disaster, such as a hurricane or an earthquake. Given the island's close proximity to Kick 'em Jenny, an active submarine volcano, attention should be given to ensure there is a safe and consistent supply of water in the event of an emergency situation. Grenada and its dependencies are also located within the Atlantic Ocean's hurricane track, which could increase vulnerability to catastrophic climatic events. Ensuring a safe supply of water during an emergency reduces the chances of water-and/or food-related mortality and morbidity.

The results indicate most of the respondents performed maintenance of their rainwater system. The extent of maintenance parts of the system (collection surfaces, conveyance, and storage facility) was not investigated in this study. While most of the respondents stated they did yearly maintenance, some also felt they should do more. This may be an indication of the need for training to maintain the systems. Financial constraints may also limit maintenance, especially in households headed by women. The replicating the technology in Grenada, residents should be made aware of associated costs and educated on plans to provide for the maintenance of the system. All parts of a rainwater harvesting system should be systematically maintained as a measure to ensure the water is safe for consumption. The following recommendations may also be appropriate to address gaps and improve rainwater harvesting management in Carriacou as well as for application in replicating the technology on the mainland in Grenada:

- Conduct a follow-up risk assessment study in Carriacou with a representative sample to identify hazards and estimate the risk associated with the conditions. The information from this study should be used in the development or modification of interventions to improve water safety in Carriacou.
- Conduct community-based national education programs on best practices in rainwater harvesting technology. The messages should be communicated through various channels to ensure reach to the widest cross-section of the population.
- Establish a team/unit with responsibility for all activities related to rainwater harvesting at the national level.
- Monitor the condition of rainwater harvesting systems and operations on a regular basis. Ensure systems contain all appropriate safety devices such as first flush devices, rodent-proof, and drain taps in plastic tanks.
- Create policies that promote safety in rainwater harvesting. Address non-compliance with public health policies.

- Conduct a national survey to collect baseline data from residents on the mainland prior to the construction of systems. Post-training and post-adaptation surveys should also be conducted to evaluate differences in knowledge, attitudes, and practices.

Although a small sample was included in this study, useful information was provided on household water supply, knowledge about and attitudes to rainwater harvesting, rainwater harvesting practices, and the use and treatment of rainwater for domestic purposes in Carriacou. Recommendations are made to address gaps and to improve the management of rainwater harvesting systems in Carriacou. The recommendations can be referenced in the regional PPCR initiative to highlight an evidence-based approach in its work. Further studies are needed, however, to validate the situation in Carriacou. Meanwhile, the Government of Grenada, through the Environmental Health Department, can begin to take steps towards replication with improved practices on the mainland while ensuring an appropriate supportive environment for rainwater harvesting practice to thrive. Climate change has significant impacts on water supply and quality. Water security, however, is crucial for public health and to ensure a high quality of life for all the citizens.

ACKNOWLEDGMENTS

The authors are grateful to St. George's University, the Windward Island Research Foundation (WINDREF), and the Produce Chemical Laboratory in Grenada for their various support for this study. Funding for this study was provided by the Windward Island Research Foundation (WINDREF), Small Research Grant Initiative (#SRGI 19004). The authors declare that they have no conflict of interest. Informed consent was obtained from each individual participant involved in this study. This study was conducted in accordance with the 1964 Declaration of Helsinki and its subsequent amendments.

Chapter 98

ASSESSMENT OF RECREATIONAL WATER QUALITY IN THE SOUTHERN COASTAL AREAS OF GRENADA

Sabrina Compton*, BSc, MPH and Martin Forde, ScD, REng

Department of Public Health and Preventive Medicine,
St George's University, St George's, Grenada

ABSTRACT

The microbial quality of recreational coastal waters along the southwestern coast of Grenada was assessed. A total of 120 samples taken from 12 sites were analyzed for enterococcus faecalis, fecal coliform, pH, temperature. Two samples per day from six sites were collected bi-weekly between 8 a.m. and 12 p.m. during the period of November-December 2008. Rainfall data for the sampling period was obtained from the Grenada Meteorological Office. The highest percentage of sampling days exceeding the World Health Organization's (WHO) recommended limits for enterococcus faecalis was recorded at two sites—Beausejour-Bay (70%) and Carenage-Bay ((60)%). The Carenage-Bay sampling site had the highest percentage of sampling days exceeding recommended limits for total fecal coliform ((60)%). Overall, 30% of the samples analyzed showed enterococcus faecalis and total coliform levels above the recommended limits. Other measured variables were inconsistent with increased microbial content. No correlation was observed between rainfall and enterococcus faecalis. This study found that the majority of beaches along the Southwestern coast of Grenada exceeded the recommended limits by WHO for fecal coliform and enterococcus faecalis period.

INTRODUCTION

In 2017, the United Nation World Water Development Report stated that over 80% of all wastewater worldwide, released into the environment, was untreated [1]. On a global level, countries are working towards ensuring good water quality for sustainable growth and

* Corresponding Author's Email: scompton@sgu.edu.

productivity in accordance with the Sustainable Development Goal 6 (SDG 6) [2]. In order to measure the achievement of this sustainable development goal, water quality measures have been established for recreational waters, both freshwater and coastal water bodies. Poor recreational water quality measurements are usually associated with health problems and environmental concerns [3]. On the other hand, high quality recreation water indicators have a concomitantly reduced level of adverse health problems [3]. Many European countries have reported excellent recreational bathing waters in the last 40 years, which they have attributed to robust water quality monitoring systems [4].

In the Caribbean, recreational waters are almost exclusively located on the coasts of small island states. These coastal recreational waters can be contaminated through point and non-point sources such as agricultural and industrial runoffs, sewage discharges, and industrial effluents [5]. Contamination of the coastal environment has been found to be associated with an increase in the incidence of infectious diseases [6]. Some diseases and infections acquired through bathing in contaminated waters include acute febrile respiratory illness, infections of the eye, ear, nose and throat, and serious infections such as meningitis, hepatitis A, typhoid fever and poliomyelitis [7]. Other diseases caused by bathing in contaminated recreational waters or consumption of contaminated seafood include swimmer’s itch, gastroenteritis, dermatitis, viral hepatitis, and dysentery [8].

Figure 1. Sampling sites, river outlets, and sewage outfalls along the West coast of Grenada.

Environmental problems arise when sewage is discharged inappropriately into coastal areas. This can lead to very high nutrient loads from phosphates and nitrates, which cause localized eutrophication, which in turn is associated with toxic algal blooms [7]. The temperature and pH levels can also play a significant role in coastal water quality since both affect the growth and multiplication of aquatic organisms and fecal indicator organisms [5]. Caribbean countries, which depend on coral reefs as a natural defense for coastal areas and for the survival of fish populations, already face social and economic threats as a result of the degradation and loss of reefs [9].

Coastal waters are used for several activities, including transportation, food production, hydroelectricity generation, and for the deposition of sewage and industrial waste [7]. In the Caribbean, many islands market themselves through the promotion of clean, white sandy beaches; safe for swimming, snorkeling, diving, and bathing. Beach recreational activities are largely hosted around holiday activities and festivals. Not many Caribbean countries, however, have given sufficient attention to the importance of monitoring their recreational water quality. Regulations for sewage treatment and other sources of contamination, such as agricultural runoff, are either non-existent or not adequately implemented in the Caribbean countries. In 2012, the Caribbean Regional Fund for Wastewater Management (CREW) estimated that approximately 85% of the wastewater entering the Caribbean Sea was not treated [10]. As a result, many Caribbean coastal water areas are vulnerable to contamination, and those who use these areas are exposed to pathogenic microorganisms that can cause severe infections.

Grenada, approximately 133 square miles, is located 12.07° North and 61.0° West and is home to approximately 110,000 people. The island is divided into seven parishes with the parish of St. George, located in the South West, being the most populated with approximately 37,057 residents [11] (see Figure 1). The capital city, St. George's, is also located in this parish, which is the most developed on the island. One of the areas most visited by tourists is Grand Anse, located in the south of St. George parish and popular for shopping and the Grand Anse Beach. Wastewater, mainly greywater from residential, commercial, and industrial establishments, from the Grand Anse area is channeled through a 15-mile conveyor and discharged to a marine outfall. There is currently no secondary treatment of sewage in Grenada. During the rainy season, because of the island's mountainous topography, there is also severe soil erosion and land degradation [12] which affects the quality of the coastal recreational waters. Due to recent changes in the climate, however, rainfall has become less predictable and there has been a 61% increase in rainfall during the dry season (January to May) over the period 1990-2009 [13]. Coastal dynamics also play an intrinsic role in determining the status of water quality [14]. Closed bays are subjected to higher concentrations of contaminants since they have a low renewal frequency compared to open bays [15].

A study investigating the prevalence of *escherichia coli* and *enterococcus faecalis* in coastal environments located in the Southern parts of Grenada was limited to four coastal sites located on the furthest end of the parish of S. George [16]. In another study conducted in 2006 on the West coast of Grenada near the St John's Bay river, measurements of *enterococcus faecalis* levels were taken and found to be low [17]. A report from the Government of Grenada's Epidemiological Department stated that gastroenteritis was one of

the major acute illnesses affecting infants on the island. Approximately 1067 cases were reported in March 2012 as compared to 319 reported in March 2011 [18].

In recognition of the importance of having adequate monitoring systems in place, the Caribbean Environmental Health Institute (CEHI), subsumed into the Caribbean Public Health Agency (CARPHA) as at January 2012, produced and published guidelines for the region's coastal water quality [7]. The recommended limits for marine waters for *escherichia coli* is 126 CFU/100 ml, for fecal coliform 200 CFU/100 ml, and for *enterococcus faecalis* 35 CFU/100 ml [7]. In assessing water quality, multiple microbial indicators are used to make correlations between the number of microbes and possible contamination. According to the WHO, *enterococcus faecalis* meets all regulatory parameters standards as opposed to total coliform, which is not specific to fecal material [19]. The United States Environmental Protection Agency (EPA) also recommended the use of *enterococcus faecalis* as the best indicator for assessing recreational water health risk [20]. It is expected that by assessing Grenada's coastal waters using WHO and EPA recommended indicators, data can be obtained to provide a better understanding of the quality of the coastal waters of the Southern part of Grenada.

In this study, the quality of recreational waters of Grenada's most populated coastal regions was assessed and compared with WHO and EPA recommended standards. Sources of possible contamination were examined along with possible health-related outcomes to determine whether water quality monitoring is necessary to ensure safe water-related recreational activities in Grenada.

OUR STUDY

A cross-sectional sampling for *enterococcus faecalis* and fecal coliforms in the coastal waters located in the Southwestern regions of Grenada was taken from November 4th to December 3rd, 2008.

Sample Sites

Of the 45 beaches in Grenada, 12 beaches located in the South Western region of the island were selected for this study. The 12 sampled sites were Halifax-Bay ((HA)), Beausejour-Bay ((BA)), Flamingo-Bay ((FB)), Grand-Mal (GM), Carenage-Bay (CA), the Lagoon (LA), Mt-Pandy-Beach (PA), Morne-Rouge-Beach (BBC), Pink-Gin-Beach (PG), and Grand-Anse-Beach (GA) (see Figure 1). The GA site, which is approximately three miles long, was divided into three zones: Grand-Anse-Top (GAT), Grand-Anse-Middle (GAM), and Grand-Anse-Bottom (GAB). Each of these sampling areas is subjected to major exposures to contaminants from various water sources such as rivers, stormwater runoff, and sewage discharge. All of the Grand Anse (GA) sampling sites were heavily patronized by the local residents and tourists. The Grand Mal (GM) area is also a heavily populated zone and subject to runoffs from construction sites. GM site also has a sewer outfall that empties directly into its waters from the Queens Park area. Two of the other sampling sites, the

Lagoon (LA) and the Carenage (CA) sites, are major docking areas for ships, cargo boats, yachts, and barges.

Physical Parameters

To better assess the quality of the recreational waters, physical parameters such as surface temperature, pH, amount of rainfall, and general weather conditions were recorded. Temperature was measured directly after sampling and noted in degrees Celsius.

Rainfall

Rainfall data for the sampling period was obtained from five meteorological stations operated by the Grenada Meteorological Office. These meteorological stations were chosen based on their location and the direction of the runoff water caused by the rainfall. The chosen stations were located in Vendomme, Mardigras, Annandale, Botanical Gardens, and the Maurice Bishop International Airport. Rainfall data, measured in millimeters (mm), was collected to allow for investigation of possible relationships between water quality and land runoff associated with rainfall. For this study, a low level of rainfall was defined as levels < 10 mm, a moderate level of rainfall as 10 > 100 mm, and a high level of rainfall as >100 mm.

Sample Collection

Water samples were collected during the rainy season, between November 4 to December 3, 2008. Samples were collected bi-weekly for five weeks. Six sites were visited each day, and two samples were taken at each site, amounting to 24 samples per week. Samples were collected between 8 a.m. and 12 p.m. so that any variation in the levels of contamination due to downpours, wind direction, and tidal levels could be evaluated. Serial dilution techniques were used to reduce the density of the organisms present in the samples and to improve measurement accuracy.

The equipment and reagents used for collecting water samples were prepared according to protocols specified by the EPA [20]. All equipment was sterilized using detergent and hot water, followed by distilled water. Sampling bottles were autoclaved for 15 minutes up to 121°Celsius and kept closed after sterilization. All samples were taken 5 ft offshore and at a depth of 40 cm below the surface every Monday and Thursday of the week. This sampling protocol was recommended, given the majority of beach users occupy up to this area and where subsurface currents move much slower compared to surface currents [22]. For each sample, 100 ml of water was collected leaving space for the sample to be shaken. Testing was done within one hour of sampling. Samples that were not analyzed within this timeframe were refrigerated at or below 4°Celsius.

FINDINGS

Fecal coliform counts for HA, PB, GAM, BB, and FB were above recommended acceptable limits for 10% of the sampling days. This was the lowest observed percentage compared to all other sampled sites. Both BBC and PG sampling sites exceeded recommended fecal coliform limits 20% and 30% of collected samples, respectively, followed by GM, LA, GAT, and GAB in which 40% of samples at these sites exceeded the recommended acceptable limits. At CA, 60% of sampling days were above the recommended limits and was the highest in comparison to all other sites sampled (see Figure 2).

Figure 2. Fecal coliform levels above recommended limits by sampling sites for November 4 to December 3, 2008.

Enterococci faecalis

The recommended acceptable *Enterococcus faecalis* limits were exceeded at all sampled sites except FB. PA exceeded recommended limits in 20% of sampling days, and GM, LA, GAT, GAM, GAB, and BBC exceeded recommended limits for 40% of the sampling days.

*Black bars indicate percentage of *Enterococcus faecalis* counts > 200 CFU/100 ml samples out of the total that exceeded recommended limits. Example: BB shows percentage of samples exceeding recommended limits (35 CFU/100 ml) in grey (70%) and percentage of samples exceeding 200 CFU/100 ml (40%) of the total in black. NB: This is to emphasize the severity of contamination.

Figure 3. Percentage of *Enterococci faecalis* above recommended limits by sampling site in St. George's Grenada for November 4 to December 3 2008.

Sample sites LA and GAB had counts over 200 CFU/100 ml on 50% of those sampling days and GAT on all of those days. HA and CA showed similar results exceeding recommended limits on 60% of the sampling days, however, CA level reached counts > 200 CFU/100ml on all sampling days, whilst HA remained below 200 CFU/100ml in all samples. BB exceeded recommended limits on 70% of the sampling days, with 57% of those samples reaching counts above > 200CFU/100 ml (see Figure 3).

Temperature

The temperature for all bays ranged 20.4-31.6°C (see Figure 4). The greatest temperature range was recorded for CA, 20.4°C to 30.1°C.

Figure 4. Maximum and minimum temperatures by sampling site for the period November 4 to December 3 ,2008.

pH

Recorded pH readings remained within the acceptable range for all sampling sites throughout November, 2008.

Figure 5. Average rainfall for the month of November in St. Georges, Grenada.

Figure 6. Percentage of enterococcus faecalis above limit and rainfall for the same sampling day.

Rainfall

High levels of rainfall were reported on the following sampling days: November 12, 19, and 20 (see Figure 5). It was observed that the rainfall pattern varied greatly with the corresponding high microbial counts (see Figure 6). Chi square analysis revealed that rainfall and *enterococcus faecalis* were independent as observed throughout the sampling period (χ : 0.63, p : 0.42).

DISCUSSION

Several studies have shown the presence of fecal indicator organisms in coastal waters of Grenada [16, 23, 24]. In 2008, an assessment of samples collected from the HA revealed readings that exceeded recommended fecal coliform levels for 10% of the sampling days when the amount of rainfall was low on the same day and moderate the previous day. This study found that *enterococcus faecalis* counts exceeded recommended acceptable levels for 60% of the samples when rainfall levels were low on the same day and moderate 24-hours before testing. Temperatures in the HA bay ranged from 26.8- 29.8°C.

This level was observed with the lowest temperature and exceeding levels of *enterococcus faecalis* and moderate levels of rainfall on the same day and high on the previous day. Halifax Bay is an enclosed bay and subjected to low water renewal and high accumulation of sediment. The area is in the vicinity of the island's main landfill. Runoff from the landfill most likely also accounted for the increased microbial levels recorded at this location by Garrido-Perez in 2008 [15].

BA samples exceeded recommended fecal coliform levels at a similar rate as HA (10%) when rainfall levels were low on the same day and on the previous day. *Enterococcus faecalis* levels exceeded recommended levels in 70% of the sampling sites which, correlated with low, moderate levels of rainfall on the same day, and low-high levels of rainfall 24 hours before testing. This was the highest recorded percentage amongst all tested sites. Of these samples, 57% were >200.5 CFU/100ml and showed a low correlation with high levels of rainfall.

Studies have shown that high rainfall has been associated with increased microbial counts [24]. The temperatures measured in BA ranged from 28-30.0°C. Further, no strong correlations were noted with temperature, exceeding levels of *Enterococcus faecalis*, and high levels of rainfall, either on the same day and 24 hours before testing. A reason why rainfall correlations may have been weak is that the BA is more open and, therefore, more amenable to the flushing of any contaminants [15]. The *enterococcus faecalis* levels may be high for this location due to continuous contamination by untreated septic tanks that enters the river, as indicated by previous studies [25]. The marine estuary located at the mouth of this bay can also present major problems when contaminated from upland sources [26].

The FB samples exceeded the recommended fecal coliform levels at rates similar to HA and BA (10%) when rainfall levels fell at low levels on the same day and moderate on the previous day. The temperatures measured in this bay ranged from 28.4-29.9°C. Recorded *enterococcus faecalis* levels did not exceed recommended levels at any sampling site. Highest rainfall levels 24 hours before and on the same day resulted in the lowest level of *enterococcus faecalis*, which pattern was also observed in previous studies [27]. This may have been as a result of protective factors such as increased dilution, the absence of potential sources of pollution, such as runoff from drains, and the bay's long distance from residential areas. No observed correlations could be made between either temperature and high levels of *enterococcus faecalis* or high levels of rainfall on the same day and 24-hours before testing.

The GM samples exceeded recommended acceptable fecal coliform limits for 40% of the sampling days when rainfall levels were low on the same day and low to moderate on the previous day. The temperature at this bay ranged from 28.3-30.6°C. *Enterococcus faecalis* levels exceeded recommended limits for 40% of the samples, however, none exceeding 200 CFU/100 ml. This correlated with low levels of rainfall on the same day and low to moderate levels 24-hours before testing. There was no correlation with the lowest temperature and exceeding levels of *enterococcus faecalis* and high levels of rainfall both on the same day and 24-hours before testing. The BM beach is an open area, therefore, frequent flushing of contaminants with high levels of rainfall may be the reason for the low microbial counts occurring with rainfall. Other parameters such as tidal flow and height could have been important factors that help explain the increase in microbial indicators at this sample site [28]. The observed occurrence of a high level of fecal coliform and *enterococcus faecalis* with high temperatures may also be the cause of conflicting results. Temperature is known to affect the rate at which bacteria grow and multiply [5]. Other factors, such as contamination from rivers, may have played a role in the increased microbial counts [7].

The CA samples exceeded recommended fecal coliform levels on 60% of the sampling days when rainfall levels fell to low to moderate levels on the same day and low, moderate, and high levels on the previous day. Temperature at this bay ranged from 20.4-31.0°C. This was the highest range noted for the month at all sites and may have been due to the area being completely surrounded by concrete infrastructure which contributes to a higher rate of runoff and flushing when rainfall occurs. *Enterococcus faecalis* levels exceeded recommended levels in 60% of the sampling sites, exceeding >200.5 CFU/100 ml on all days, and was not observed to occur in conjunction with high levels of rainfall. The high level of *enterococcus faecalis* could be attributed to the densely populated Carenage area which is a docking station for barges, cargo boats, and ships. Runoff from these facilities drains directly into the site. Studies have suggested *enterococcus faecalis* level increase in such areas [7, 19]. Low levels of *enterococcus faecalis* were observed with high levels of rainfall, which may have been due

to dilution of contaminated water. The LA samples exceeded recommended fecal coliform levels 60% of the sampling days when rainfall levels fell to low 1 on the same day and low to moderate on the previous day. Temperature on that bay ranged from 28.2-30.7°C. *Enterococcus faecalis* levels exceeded recommended levels in 40% of the sampling sites, exceeding >200.5 CFU/100 ml on 50% of those days and was not observed to occur in conjunction with high levels of rainfall. High level of *enterococcus faecalis* could be attributed to the highly developed commercial activities in the area as well as a docking station for barges, cargo boats, and ships. Runoff from facilities also drains directly into the site. Construction activities were noted to have occurred during that period [30]. Low levels of *enterococcus faecalis* were observed with high levels of rainfall, which may be due to the dilution of contaminated water, similar to the situation at CA. PA samples exceeded recommended fecal coliform levels 40% of the sampling days when rainfall levels fell at mostly low levels on the same day and low levels the previous day although one day was noted to produce heavy rainfall. Temperature at this bay ranged from 28.2-30.7°C. *Enterococcus faecalis* levels exceeded recommended levels in 20% of the sampling sites and were observed when rainfall levels fell at mostly low to moderate levels on the same day and low levels the previous day. A number of protective factors were present on this beach, including the high amount of flora and absence of drains emptying directly unto to beach.

GA samples (top, middle, and bottom) exceeded recommended fecal coliform levels in 40%, 10%, and 40% samples, respectively, when rainfall levels were at mostly low to high levels on the same day and low the previous day. Temperature at these sites ranged from 28.0-30.8°C (GAT), 28.3-30.4°C (GAM) and 28.2-30.2°C (GAB). *Enterococcus faecalis* counts exceeded recommended levels in 40% of the sampling sites GAB, GAM, and GAT. GAT and GAB, however, reported samples exceeding level >200.5 CFU/100ml in 40% and 20% of all samples, respectively. This was thought to be associated with drains which were observed to empty runoff directly into the swimming area of both sites (GAT and GAB) but were not present at GAM. There are several factors affecting this beach, including being frequently populated with tourists and local residents engaging in recreational activities.

BBC exceeded recommended fecal coliform levels on 20% of the sampling days when rainfall levels fell at mostly low levels on the same day and low levels the previous day, although one day was noted to produce heavy rainfall. The temperatures measured at this bay ranged from 28.2 -30.1°C. *Enterococcus faecalis* levels exceeded recommended levels in 20% of the sampling sites and did not occur in conjunction with high levels of rainfall.

PG exceeded recommended fecal coliform levels 30% of the sampling days, which was in conjunction with low to moderate rainfall the same day and low the previous day. Temperatures measured at this bay ranged from 28.5°-29.7 C. *Enterococcus faecalis* levels did not exceed recommended levels. This may be mostly due to the open bay and high flushing which may have carried contaminants away from the sample site.

Limitations of this study include possible errors in sample collection and preparation. These samples were collected over 12 years ago in 2008 and, therefore, it might be questioned whether the same results would be achieved today if a new batch of samples were collected. It should be noted that most of the factors that likely contributed to the observed high microbial levels, such as high levels of development and anthropogenic activity, have further increased over the years [31]. Additionally, the St. George's sewage outfall still releases untreated sewage and no major improvements in the quality of the water have been found [31, 32].

In conclusion, measurements of two recreational water quality indicators, fecal coliform and *enterococcus faecalis*, at 12 coastal sites located along the southwestern end of Grenada found results that exceed acceptable WHO recommended limits. The sampling site with the highest percentage of samples exceeding recommended levels was BB (70%), which is most likely due to sewage leakages from points along the river leading into this bay. Following BB were HA and CA (60%), LA GAT, GM, GAM, BBC, LA, and GAB (40%). FB (0%) had the best compliance with WHO's recommendations and had no samples that exceeded the recommended limits. The sampling site with the highest levels of fecal coliform was CA (60%), followed by GAT, GAB, GM and LA (40%), PG (30%), BBC (20%), and PB, BB, HA, PB (10%), respectively. The amount of rainfall and *enterococcus faecalis* was shown to have a negative association, possibly due to several factors affecting site flushing and protective mechanisms. Due to inconsistencies in the correlations between rainfall and microbial contamination, it is recommended that water quality monitoring systems be put in place to ensure that persons frequenting the beaches located along the southwestern coast are made aware of the safe days for swimming in these areas. Given that this study was done within an approximate one-month time period, this assessment should be replicated, extending over other months of the year, which can allow for a better assessment of the relationship between rainfall and microbial indicators. Additionally, an extended period of monitoring is necessary so that a comparative analysis can be done between the dry and wet seasons in Grenada. It is also anticipated that the data from this study will provide key information for the Government of Grenada on where best to install proper drainage systems to ameliorate the risk of contaminating coastal sites.

ABSTRACT

Metabolic syndrome is a collection of risk factors that include insulin resistance, dyslipidemia, visceral adiposity, and hypertension. Studies have shown contrasting results regarding its association with anxiety and depressive symptoms. The primary aim of this study was to evaluate the association of metabolic syndrome and the severity of anxiety or depression. Our objectives were to estimate the prevalence of anxiety and depression in Aruba. We conducted a cross-sectional study in Aruba in November 2016. Participants were assessed for metabolic syndrome using the harmonized criteria and were screened for depression and anxiety using the Patient Health Questionnaire-9 and the General Anxiety Disorder-7 questionnaires, respectively. We used the χ^2 test/Fisher's Exact test to compare proportions, and the unpaired t-test to compare continuous variables between groups. Statistical significance was reported at the 0.05 significance level. Our sample included a total of 181 participants, 103 (56.9%) of whom were women. A total of 67 (37.0%) people reported signs of anxiety, while 72 (39.8%) people reported signs of depression. In comparing metabolic syndrome status, there was a statistically significant difference for severity of anxiety ($p = 0.013$) but not for severity of depression ($p = 0.228$). The mean PHQ9 ($p = 0.027$) and the mean GAD7 ($p < 0.001$) scores were both significantly higher in people without metabolic syndrome. Participants with metabolic syndrome had decreased levels of anxiety and depression. There is a high prevalence of anxiety and depression in Aruba.

INTRODUCTION

Metabolic syndrome (MetS) is a collection of risk factors that include insulin resistance, dyslipidemia, visceral adiposity, and hypertension [1]. Studies have shown there is a direct relationship with metabolic syndrome and the development of cardiovascular diseases [2] and type 2 diabetes mellitus [3]. Moreover, the risk of myocardial infarction and cerebrovascular disease triples in those with metabolic syndrome [3]. However, in addition to having an increased risk of cardiovascular diseases, metabolic syndrome has been shown to have an increased association of mood disorders, notably anxiety [4] and depressive symptoms [5]. Those with metabolic syndrome components manifest a low-moderate, chronic inflammatory state [6]. Concurrently, inflammation has been related to the development of some depressive disorders [7]. Other studies suggest that chronic systemic inflammation might explain the link between metabolic syndrome and anxious-depressive syndromes [6].

The relationship between mood disorders and metabolic syndrome has been considerably investigated. However, there are contrasting findings which are likely due to variation in sample demographics. Nonetheless, these investigations have shown to be commonly rooted in the correlation between mood and anxiety disorders with an increased risk of cardiovascular morbidity and mortality [8]. In addition, a study by Ellouze et al. showed that patients with type 2 diabetes and depression displayed poorer glycemic control and less medication compliance as compared to those without concurrent depression [9]. Thus, there may be other clinical implications relating to pharmacological treatment of patients with metabolic syndrome components and mood disorders. Therefore, a better understanding of the relationship between metabolic syndrome and anxiety or depression can potentially target their etiologies and consequently, provide a foundation for the development of novel therapies.

The primary aim of this study was to evaluate the association of metabolic syndrome and the different levels of severity of anxiety or depression in a sample of Aruban adults. Our objectives were to screen participants with the General Anxiety Disorder-7 [10] questionnaire and the Patient Health Questionnaire-9 [11] to estimate the prevalence of anxiety and depression, respectively. We hypothesized that there would be a positive association between metabolic syndrome and increasing levels of severity of anxiety and depression.

OUR STUDY

This study was approved by the institutional review board of Xavier University School of Medicine, Aruba. Written informed consent was obtained from all study participants. A cross-sectional study was conducted at Xavier University School of Medicine, in November 2016, during its Annual Health Fair.

The health fair was held at the campus of Xavier University School of Medicine, from 7 AM to 11 AM. Participants were recruited by announcements on local radio and television, and by flyers posted at popular supermarkets four weeks before the event.

We collected data on sociodemographic variables, health behaviors, depression, anxiety, and metabolic syndrome by using a structured questionnaire. The interviews were conducted in English, Papiamentu, and Spanish. Occupation was based on the International Standard for

Classification of Occupations (ISCO-08) [12] and was grouped as professionals, skilled workers, unemployed, and retired.

Assessment of Depression and Anxiety

We screened participants for depression and anxiety with the Patient Health Questionnaire-9 (PHQ9) [11] and the General Anxiety Disorder-7 (GAD7) [10] questionnaires, respectively. Participants were asked whether they had experienced symptoms of depression or anxiety within the past two weeks. Depression and anxiety were categorized as mild, moderate, or severe, using the cut-off points of 5, 10, and 15, respectively.

Assessment of Metabolic Syndrome

Metabolic syndrome was defined according to the harmonized clinical criteria [1] which require that at least three of the following five criteria have to be met: fasting plasma glucose (≥ 100 mg/dL and or diabetes medication), triglycerides (≥ 150 mg/dL and or drug treatment for elevated triglycerides), HDL cholesterol (< 40 mg/dL in males and < 50 mg/dL in females and or drug treatment for reducing HDL cholesterol), blood pressure (systolic ≥ 130 mm Hg and or diastolic ≥ 85 mm Hg and or use of antihypertensive medication), and waist circumference (ethnicity and country-specific cut-off; we used the International Diabetes Federation [13] cut-offs for Euroid: 94 cm for men and 80 cm for women). If patients had met the criteria for metabolic syndrome, they were contacted by the laboratory with the results and were recommended to visit their health care provider.

Measurements and Biochemical Analyses

Waist circumference was measured with a soft tape, on standing subjects, at the level of the umbilicus. Blood pressure was measured on the right arm using a manual mercury sphygmomanometer after the subject had rested for 10 minutes. Systolic and diastolic blood pressures were recorded as the first and last Korotkoff sounds, respectively.

Venous blood samples were taken from the antecubital vein after an overnight fast (participants were advised to fast overnight) and serum total cholesterol was measured by standard enzymatic assays within 4 hours of collection. Blood glucose level was measured using a glucometer (ACCU-CHEK® Active strips in Accu-Chek® Active test meter, Roche Diagnostics, Germany).

Statistical Analyses

Data were analyzed using SPSS version 24 (IBM Corp., Armonk, NY, USA). Descriptive statistics (mean $\pm$ standard deviation [SD] or percentages) were computed for socio-demographic factors and the prevalence of metabolic syndrome according to the severity of

depression and anxiety. We used the unpaired *t*-test to compare continuous variables and the χ^2 test/ Fisher's Exact test to compare proportions between groups. Statistical significance was reported at the 0.05 significance level.

FINDINGS

Our sample included a total of 181 participants, 103 (56.9%) of whom were women. Most of the participants (38.1%) were between the ages of 51-70 years. Hispanics comprised 51.4% of the sample. Metabolic syndrome was present in 21.5% of the participants. A total of 67 (37.0%) people showed signs of anxiety, of which 13 (7.2%) of them had severe anxiety. Similarly, 72 (39.8%) people showed signs of depression, 11 (6.1%) of whom met the criteria for severe depression. Detailed characteristics of the sample are shown in Table 1.

Participants who were 50 years and older were more likely to have metabolic syndrome. There was no association between metabolic syndrome and sex, race, or education. In comparing metabolic syndrome status, there was a statistically significant difference for age ($p < 0.001$), occupation ($p = 0.004$), and severity of anxiety ($p = 0.013$).

However, there was no statistically significant difference for severity of depression ($p = 0.228$) based on metabolic syndrome status. Of patients who had metabolic syndrome, 30.8% of them had depression, whereas 42.2% of those who did not have metabolic syndrome had depression. Patients who had metabolic syndrome were less likely to have anxiety (15.4%) compared to those who did not have metabolic syndrome (43.0%). Interestingly, as severity of both anxiety and depression increased, participants had a lower likelihood of having metabolic syndrome. In fact, 100% of participants who had severe anxiety or depression were free from metabolic syndrome. In addition, the mean PHQ9 ($p = 0.027$) and the mean GAD7 ($p < 0.001$) scores were both significantly higher for those without metabolic syndrome when compared to those with metabolic syndrome. Results are shown in Table 2, and Figures 1 and 2.

Figure 1. Prevalence of metabolic syndrome according to severity of depression.

Figure 2. Prevalence of metabolic syndrome according to severity of anxiety.

DISCUSSION

To the best of our knowledge, this is the first study in Aruba to investigate the association between metabolic syndrome and anxiety or depression. Our results showed that anxiety and depression were both associated with metabolic syndrome reciprocally, contrary to expectation, wherein we hypothesized that there is a positive association.

In contrast to previous studies [14, 15], we found that anxiety and depression were more prevalent in participants without metabolic syndrome. Our results were similar to those of Glaus et al. [16], Herva et al. [17] and García-Toro et al. [18], even though their study samples were comprised of different demographics. A meta-analysis of eighteen cross-sectional studies showed that there was a slight increase in anxiety in patients with metabolic syndrome, with a pooled odds ratio of 1.07 (95% CI 1.01-1.12) [4]. Of significance, in this study, we screened participants for anxiety with the GAD-7 questionnaire [10] and for depression with the PHQ-9 questionnaire [11]. Both of these scales assess for anxiety or depression within two weeks of presentation. However, most of the studies in the meta-analysis [4] utilized the Spielberger Trait Anxiety Inventory (STAI) [19] and the Hospital Anxiety and Depression Scale (HADS) [20] for assessing anxiety. Nevertheless, there were inconsistent findings with these scales, even though both the STAI and HADS have more items compared to the GAD-7 or PHQ-9.

Our study showed that 37.0% of the participants had some level of anxiety, and 38.9% of participants had some level of depression. These are relatively high rates when compared to other studies on anxiety [21] and depression [22] in Latin America and the Caribbean. Even though our study found no significant association between metabolic syndrome and symptoms of depression, this might be accounted for by the lack of distinction of depression subtypes. Previous research emphasizes the importance of subtyping depression. Specifically, there have been significant findings with atypical depression and substance misuse [16].

The reciprocal association for metabolic syndrome and anxiety or depression in our study is not clearly understood. We suggest conducting large-scale longitudinal studies to investigate these relationships. However, one possible explanation for the positive association of metabolic syndrome and anxiety is the increase in sympathetic firing which, in turn, leads to an increase of metabolic syndrome components, such as hypertension and insulin resistance [23]. In interpreting the contradictory findings between metabolic syndrome and anxiety or depression, we should consider the varying diagnostic criteria for metabolic syndrome, and the different instruments utilized to measure the symptoms of anxiety and depression. Unlike the other studies, we used the Harmonized criteria [1] to establish the presence of metabolic syndrome. Furthermore, the varying demographics of sample populations in the different studies should also be taken into consideration.

An important strength of this study is seen in the reliability and reproducibility through use of the GAD-7 [24] and PHQ-9 [25]. Recruitment of the sample via media announcements and flyers in catchment areas optimized a randomly diverse group. The cross-sectional design eliminated the common obstacle of diminished participant retention. However, our study has constraints due to limitations of statistical power and the possibility of self-selection bias, as our data was collected at a health fair. In addition, the GAD-7 and PHQ-9 are not intended to reflect a diagnosis but were used as screening tools to detect symptoms of anxiety or depression within a narrow window. Moreover, the dynamics of our cross-sectional study

design does not allow for elucidation on cause and outcome for our study variables, notably metabolic syndrome and anxiety or depression.

In conclusion, the prevalence of anxiety and depression in Aruba is relatively high. Participants with metabolic syndrome had decreased levels of anxiety and depression. However, only anxiety and metabolic syndrome showed a significant statistical association. Future research should concentrate on comprehensive measures within large populations, thus allowing for isolation of variables, specifically anxiety/depression comorbidity as well as subtypes for both disorders. Conducting a longitudinal study would prove beneficial to explore the bidirectional association between metabolic syndrome and anxiety or depression. In addition, screening for depression and anxiety disorders is recommended in Aruba, which can lead to improved clinical care and implications for public health.

ABSTRACT

According to global data, the estimated prevalence of metabolic syndrome (MetS) in adults ranges from 11.9% in the Philippines to 43.3% in Puerto Rico. This study investigated the prevalence of MetS and obesity in Aruba. We hypothesized that there would be a relatively high prevalence of MetS and obesity in Aruba. We conducted a cross-sectional study in 2016. Data were collected on adults between the ages of 18 and 91 years during a Free Health Fair. Data collection methods included taking anthropometric measurements, blood pressure, and fasting blood glucose from the participants. Descriptive statistics were computed for socio-demographic variables, clinical characteristics, and the prevalence of MetS and obesity. The independent samples t-test was used to compare continuous variables, and the χ^2 test was used to compare proportions between groups. The overall prevalence rate of MetS in our sample was 21.5%, with men (24.4%) having a slightly higher prevalence rate than women (19.4%). Notably, 40.9% of the participants had pre-obesity (BMI: 25–29.9) and 32.6% were obese (BMI ≥ 30), giving rise to 73.5% of the sample having a BMI ≥ 25 . Our results have shown that metabolic syndrome and obesity are highly prevalent among adults in Aruba. Preventive measures should be taken to curtail these chronic conditions. In addition, patients with a body mass index higher than 25 should be screened for metabolic syndrome.

INTRODUCTION

Metabolic syndrome (MetS) is defined as a cluster of metabolic disorders with features of visceral obesity, elevated blood pressure, hyperglycemia/ insulin resistance, and atherogenic dyslipidemia (elevated triglycerides and decreased high density lipoprotein cholesterol levels [1]. According to global data, the estimated prevalence of metabolic syndrome in adults ranges from 11.9% in the Philippines [2] to 43.3% in Puerto Rico [3].

In the United States (US) the prevalence of MetS in adults has substantially increased in the past decade, averaging approximately 34% between 2007–2012 [4]. In the Caribbean region, the prevalence is estimated to be 21.1% in Jamaican adults [5] and 20.5% in adults of Saint Croix, US Virgin Islands [6]. To date, there is no published data on the prevalence of MetS in Aruba. However, recent studies on the prevalence rates for MetS in cities in nearby countries were reported as 34.8% in Bucaramanga, Colombia [7], and 35.3% in Zulia, Venezuela [8]. The prevalence rates reported above were based on the definition of MetS according to the National Cholesterol Education Program's Adult Treatment Panel III criteria (NCEP ATP III) [9], one of several definitions of MetS.

MetS has become a significant worldwide problem and it is associated with increased risk of cardiovascular disorders and all-cause mortality [10, 11] type 2 diabetes mellitus [12] and the most common types of cancers [13]. Risk factors for developing MetS include obesity, visceral adiposity [14], and insulin resistance [15]. With the increasing pandemic of obesity [16], there is a parallel increase in MetS [17].

The primary aim of this study is to determine the prevalence of MetS and obesity in Aruba. We hypothesized that there will be a high prevalence of MetS and obesity in the country.

OUR STUDY

We conducted a cross-sectional study during a one-day free health fair in Oranjestad, Aruba, in November 2016. The main purpose of this study was to assess the prevalence of metabolic syndrome and obesity among adults in Aruba.

Assessment of Metabolic Syndrome

We used the harmonized clinical criteria [1] to define metabolic syndrome, which requires that at least three of the following five criteria have to be met: fasting plasma glucose (≥ 100 mg/dL and or diabetes medication), triglycerides (≥ 150 mg/dL and or drug treatment for elevated triglycerides), HDL cholesterol (< 40 mg/dL in males and < 50 mg/dL in females and or drug treatment for reducing HDL cholesterol), blood pressure (systolic ≥ 130 mm Hg and or diastolic ≥ 85 mm Hg and or use of antihypertensive medication), and waist circumference (ethnicity and country-specific cut-off; we used the International Diabetes Federation [18] cut-offs for Europid: 94 cm for men and 80 cm for women). Patients who had abnormal laboratory results were contacted by the laboratory and were recommended to visit their health care provider.

Study Population and Setting

The health fair was publicized on local radio and television, and on flyers at popular supermarkets four weeks before the event. The health fair was held at Xavier University School of Medicine from 7 AM to 11 AM. The study was approved by the institutional review board of Xavier University School of Medicine, Aruba, and all participants provided written informed consent.

Adults who attended the health fair were eligible to participate in the study. A structured questionnaire was used to collect data on age, sex, race, occupation, education, marital status, and self-rated health of the participants. Other questions included diagnosis of diabetes, hypertension, and hypercholesterolemia, family history of known metabolic syndrome in at least one first-degree relative (father, mother, or sibling). Interviews were conducted in English, Papiamentu, and Spanish.

Measurements and Biochemical Analyses

The three criteria used for the assessment according to the harmonized clinical criteria [1] were: measurement of waist circumference, measurement of blood pressure, and blood samples.

Waist circumference was measured with a soft tape, on standing subjects, at the level of the umbilicus. Bodyweight and height were measured with subjects in light clothing and without shoes. Body mass index (BMI) was calculated as the weight in kilograms divided by the height in meters squared (kg/m^2) and grouped according to the World Health Organization (WHO) international classification [19].

Blood pressure was measured on the right arm using a manual mercury sphygmomanometer after the subject had rested for 10 minutes. Systolic and diastolic blood pressures were recorded as the first and last Korotkoff sounds, respectively.

Venous blood samples were taken from the antecubital vein after overnight fast, and serum total cholesterol was measured by standard enzymatic assays within four hours of collection. Blood glucose level was measured using a glucometer (ACCU-CHEK® Active strips in Accu-Chek® Active test meter, Roche Diagnostics, Germany).

Statistical Analyses

Due to a small sample size, race was grouped into Hispanic and Other (which included Caucasians, people of African ancestry, mixed-race, and other races).

Occupation was based on the International Standard for Classification of Occupations (ISCO-08) [20] and was grouped as professionals, skilled workers, unemployed, and retired. Professionals included groups 1-4 of ISCO-08 (managers; professionals; technicians and associate professionals; and clerical support workers) and skilled workers included groups 5-9 of ISCO-08 (service and sales workers; skilled agricultural, forestry and fishery workers; craft and related trades workers; plant and machine operators, and assemblers; and elementary occupations).

Descriptive statistics (mean $\pm$ standard deviation [SD] or percentages) were computed for socio-demographic variables, clinical characteristics, and the prevalence of MetS and obesity. We used the independent samples *t*-test to compare continuous variables and the χ^2 test to compare proportions between groups. All variables were reported as statistically significant at the 0.05 significance level. Analyses were performed using SPSS version 24 (IBM Corp, Armonk, NY, US).

FINDINGS

Detailed demographic and clinical characteristics are summarized in Table 1. A total of 181 participants were evaluated, in which there were 78 (43.1%) men and 103 (56.9%) women. There was a statistically significant difference between men and women regarding occupation ($p < 0.001$), exercise ($p = 0.019$), and alcohol consumption ($p = 0.01$). There was also a significant difference ($p = 0.01$) in waist circumference for men (100.1 cm [SD $\pm$ 17.8]) compared to women (93.8 cm [SD $\pm$ 14.4]).

The overall prevalence rate of MetS in our sample was 21.5%, with men (24.4%) having a slightly higher prevalence rate than women (19.4%). Notably, 40.9% of the participants had pre-obesity (BMI 25–29.9) and 32.6% were obese (BMI ≥ 30), giving rise to 73.5% of the sample having a higher than normal body mass index (BMI ≥ 25).

The prevalence of MetS in the different BMI categories according to WHO's classification [19] are presented in Table 2. Our data showed that there was a statistical difference in the prevalence rates of MetS among the different BMI categories regarding age ($p < 0.001$), occupation ($p = 0.008$), and the presence of diabetes ($p < 0.001$) and hypertension ($p < 0.001$).

Figure 1 shows that the prevalence of MetS is higher for both men and women who have a BMI greater than 25. However, even though there is no linear trend with prevalence of MetS and increasing BMI levels, there is an increased prevalence of MetS with increased severity of obesity for men. This pattern was not observed for women. Interestingly though, half of the men and half of the women with moderate obesity (BMI 35.0 – 39.9) had MetS and 100% of the men and 42.9% of the women with severe obesity had MetS.

Figure 1. Prevalence of metabolic syndrome in BMI categories.

DISCUSSION

To our knowledge, this is the first study to assess the prevalence rate of metabolic syndrome (MetS) in Aruba. Results from this study confirmed our hypothesis that Aruba has a high prevalence of MetS and obesity among adults. This high prevalence of MetS in Aruba is supported by data from previous studies with similar demographics [21]. In addition, findings from our study corroborated with the prevalence rates of obesity from global data, especially those of the United States and countries in Latin America [22]. We found that the prevalence of MetS was slightly higher among men. However, among the obese, women had a higher prevalence of MetS. Our results also showed that increasing age was a significant predisposing factor for developing MetS. Individuals over the age of 70 years showed a drastic increase in risk. However, our results differed from a study by Florez et al. [8], which showed that the 50-59 years old age group had the highest proportion of MetS.

The prevalence of MetS was disproportionate among the different occupational groups. Of particular interest, those who were retired and having a BMI greater than 25 were more likely to have MetS. Thus, a sedentary lifestyle may have contributed to having an increased prevalence of both obesity and MetS. However, a study by Browne et al. [23] showed that those who have a sedentary occupation but have met the requirements for physical activity have a reduced risk of developing MetS. However, on closer examination, we did not find a significant association between occupation and exercise.

Our results clearly show that the prevalence of MetS was independently associated with pre-obesity and obesity, hypertension, and diabetes. Thus, these findings suggest the importance of screening patients with diabetes, hypertension, and BMI greater than 25 for metabolic syndrome. Årnlöv et al. showed that insulin resistance, higher BMI levels, and MetS had higher incidence rates of cardiovascular events [24].

The following methodological considerations have to be taken into account when interpreting our findings: firstly, the sampling approach was self-selection and, therefore, may not be representative of the entire population. Thus, the prevalence rate obtained in our study may not reflect the true prevalence rate for MetS in Aruba. However, our study may have underestimated the actual prevalence of MetS in Aruba because of the following reasons: we used the International Diabetes Federation cut-offs of waist circumference for Europid: 94 cm for men, instead of 90 cm, which is the suggested value for Ethnic Central and South American. Our sample comprised of 17.8% Hispanic men. In addition, biological measurements were obtained for fasting total cholesterol only, and not for triglycerides or HDL cholesterol levels. Thus, these criteria were not assessed in our diagnosis of MetS. Moreover, a study by Tull et al. [6] showed that Hispanic ethnicity was associated with an increased risk of MetS, high triglycerides, and low HDL-C. Secondly, our sample size was relatively small and may not have adequate statistical power.

We recommend that a population-based study with a larger sample size should be conducted to confirm our findings and to determine the country-wide prevalence of MetS in Aruba. The 51-70 years and >70 years age categories reported the highest level of MetS. In addition, those who were retired, had diabetes, and hypertension were at increased risk of MetS. Therefore, we suggest that people with these demographics should be screened for MetS. We also recommend having more health fairs and health-outreach programs for the people of Aruba. One of the benefits of health fairs is the increased likelihood of screening for chronic conditions, such as MetS, in individuals who may not otherwise get tested, due to their occupation or socioeconomic status.

CONCLUSION

In conclusion, our results have shown that metabolic syndrome and obesity are highly prevalent in the Aruban adult population. Preventive measures should be taken to curb these chronic and debilitating conditions. In addition, patients with a body mass index higher than 25 should be screened for metabolic syndrome.

ABSTRACT

In this chapter, we examine the prevalence of overweight and obesity among a representative sample of Grenadian adolescents. Recent studies have been equivocal on the degree to which the obesity epidemic has affected Grenada with high rates of overweight and obesity among Grenadian adults. A nationally representative sample of first-year students (i.e., Form 1) (n = 689) aged 11 to 14 years old from the twenty-three secondary schools in Grenada was assessed as part of the Grenada School Nutrition Study (GSNS). Height and weight were objectively assessed using standard measures. Standardized BMI percentile (BMIz score) was calculated using the Centers for Disease Control and Prevention (CDC) criteria. BMIz scores above the 85th percentile were classified as overweight and BMIz scores above the 95th percentile were classified as obese. Overall Grenadian adolescents have low rates of overweight (17.6%) and obesity (7.6%). Girls had nearly twice the rates of overweight compared to boys (i.e., 22.7% versus 12.2%) but similar rates of obesity (i.e., 8.2% versus 6.8%). Grenadian adolescents demonstrate low rates of obesity compared to both Grenadian adults and their

US counterparts. This discrepancy in overweight and obesity between Grenadian adults and adolescents suggest Grenada is undergoing an epidemiologic transition with regard to the obesity epidemic.

INTRODUCTION

The two overarching goals of the Healthy People 2010 initiative are to 1) increase quality and years of healthy life and 2) eliminate health disparities. The rising prevalence of overweight and obesity (OW/OB) represents the primary threat to the achievement of these goals in the coming years [1-4]. Despite the growing awareness of the negative health impact of poor diet, physical inactivity, and excess weight, the prevalence of OW/OB has continued to increase in the United States (US) [2, 5]. During the last three decades, according to national surveys (i.e., NHANES), the US obesity rate has doubled in adults and tripled in children and adolescents and is leading to growing disparities in obesity risk among poor and minority populations [6-9]. The consensus among public health experts is that human genetic changes are not responsible for the rapid rise in obesity, and the explanation must lie in broad social determinants resulting in local environmental exposures that influence diet and physical activity [10-13].

Despite researchers having literally watched the epidemic of obesity unfold over the past three decades, not only in the US but across the globe, identification of the “drivers” of the epidemic remains contentious [14-16]. The effort to characterize the “drivers” of the epidemic involves the identification of the factors responsible for upsetting the balance in the “energy intake/energy expenditure” equation over the past four decades. On the energy intake side, the global food system that provides a “Westernized” diet of cheap, palatable, energy dense-foods is implicated [14, 16, 17]. On the expenditure side, the transition to sedentary occupations with low energy expenditure is implicated [18, 19]. The inability to arrive at a consensus is attributed to the lack of research with designs sufficient to link local obesogenic environments - created by the societal drivers - with individual obesity-related behaviors [20-22].

The chance for characterizing the factors that “drove” the epidemic in the US over the past decades is gone. Even retrospective studies of dietary trends raise more questions than they answer, and they do not get at the role of obesogenic environments [23]. Consequently, research on the drivers of the pandemic of obesity requires a study among a population that has not yet undergone the epidemiologic transition. According to the World Health Organization’s (WHO) “Burden of disease” (GBD) approach, it is projected that non-communicable diseases (NCDs) will represent the greatest disease burden in low- and middle-income countries (LMIC) by 2030 [24, 25]. The onset of NCDs, including cardiovascular disease, diabetes, and cancer represents an epidemiologic transition that is attributed to the emergence of local obesogenic environments [26-28]. In addition, the epidemiologic transition in LMIC is believed to be occurring at a much faster rate due to the globalization of the corporate food infrastructure.

The current study was organized to determine the degree to which the epidemiologic transition with regard to obesity has affected Grenadian adolescents. A recent study by the CDC indicated the obesity epidemic has already impacted Grenadian adults. Consequently, it could be assumed that Grenadian adolescents were already also affected by the epidemic.

OUR STUDY

The current study is part of a project titled the Grenada School Nutrition Study (GSNS). The GSNS goal is to identify behavioral and environmental factors that might be intervened on to prevent the development of obesity among Grenadian adolescents.

Figure 1. Map of Grenada demonstrating location of the 23 GNS schools.

Study Sample

The GSNS was designed to be a representative sample of all first-year secondary students (i.e., Form 1) drawn from the 23 public and private secondary schools across the tri-island nation of Grenada. Form 1 students range in age from 11 to 14 years. Randomization was performed at the classroom level resulting in an eligible sample of 1,004 students in 35 classrooms (i.e., in schools with only one Form 1 class all students were included) making up roughly 55% of all Form 1 students in Grenada. Parental refusals ($n=276$) and students who were absent on the day or did not complete all the assessments or surveys ($n=39$) resulted in an effective sample of 689 students in the cohort. All students were assigned a unique identifier linked to their informed consent signed by their parents. Personal identifiers in the form of parents' names, phone numbers, and school identification were collected for possible followup.

Study Measures

Height, weight, and waist circumference were directly measured for each student in a privatized setting (e.g., trifold blind booth) in normal school clothing. Measurements using a portable stadiometer and electronic scale standardized before each session were repeated three times, and the average score reported.

Body mass index (BMI), calculated by dividing weight in kilograms by their height in meters squared, was used to assess excess body fat. Due to the greater sensitivity of the CDC classification system compared with the International Obesity Task Force (IOTF) classification system for characterizing excess body fat in a Caribbean adolescent population, the CDC age- and sex-specific cutoffs were used to characterize overweight (i.e., BMI≥85th percentile) and obese (i.e., BMI≥95th percentile) adolescents in terms of their standardized percentile [29].

Rural and urban designations were defined at the school level. Students attending school in the two largest towns in Grenada (i.e., St Georges and Grenville) were defined as urban students.

Statistical Analysis

Multilevel models of students nested within schools were developed to characterize the overall and between school prevalence of overweight and obesity across Grenada. For this descriptive analysis, demographic measures including age, and gender were included in the analyses.

The basic multilevel models used a random coefficient for the intercept. Thus, at student level, we have the following model,

$$Y_{ij} = \pi_{0j} + \pi_1(\text{Gender})_{1ij} + \pi_2(\text{Age})_{2ij} + \varepsilon_{ij} \qquad \text{Level 1}$$

where Y_{ij} is the outcome (e.g., obesity related behavior measurements or BMI z-score) for student i in school j . π_{0j} is the intercept, which we allowed to randomly vary across schools, which also is the estimated mean response for school j . We assume fixed effects for a vector of student level risk factors. ε_{ij} is the random effect of student i in school j , which is assumed to have normal distribution mean 0 and constant variance σ^2 for $i = 1, \dots, n_j$ and $j=1, \dots, 23$.

Table 1. BMIz scores for Grenadian adolescents by gender in the GSNS

	BMIz ≥ 95th	BMIz ≥ 85th
All	7.4%	16.6%
Male	6.8%	12.2%
Female	8.1%	21.4%

Note: Bolded prevalences are significantly different at $p < 0.05$.

The intercept π_{0j} , is allowed to randomly vary across all schools. Therefore, at the school level, we have the following model:

$$\pi_{0j} = \beta_{00} + u_{0j} \qquad \text{Level 2 (random intercept)}$$

FINDINGS

The overall rate of overweight and obesity among Grenadian adolescents in the first year of secondary schools was 16.6% and obesity 7.4%, respectively (see Table 1). There was significant sexual dimorphism in the rate of overweight Grenadians with females at greater risk than males (i.e., 21.4% versus 12.2%). The differences in obesity were not significantly different.

With regard to the difference in rates of OW/OB between adolescents attending rural versus urban schools there appeared to be significant differences in obesity rates such that urban students evidenced significantly higher rates of OW/OB compared with rural students (20.44% versus 13.43%) (see Table 2).

Table 2. Descriptive statistics for adolescents in GSNS schools by rural and urban areas

	N	Overall	Rural (N=283)	Urban (N=406)
Demographics				
Age, years	689	12.67	12.81	12.57
Race-Afro Caribbean, %	689	83.31	89.05	79.31
Gender, male%	689	48.91	55.83	44.09
Outcomes				
BMIz > 85 th , %	689	17.56	13.43	20.44

Note: Bolded prevalences are significantly different at $p < 0.05$.

An empty multilevel model (i.e., Model 1, see Table 3) with obesity risk as the outcome yielded an intraclass correlation coefficient of 0.037, indicating that 3.73% of the variance in obesity rates was between schools. Adding age and gender into the model explained most of the school level effect (see Table 3, Model 2). Adding whether or not the school was in an urban or rural area did not significantly predict obesity risk and only explained a small amount of the school level effect (see Table 3, Model 3). Finally, including age and gender in the model explained most of the urban-rural effect suggesting the greater risk of obesity in urban schools was primarily due to the greater number of female students, who are at higher risk for obesity, in urban schools.

Table 3. Parameters estimates from multilevel models predicting obesity risk among 689 students nested within 23 schools

	Model 1	Model 2	Model 3	Model 4
Individual level Measures				
Age		-0.1234		-0.1142
Male		-0.3229		-0.3159
School level Measures				
Urban School			0.1861	0.1168
Random Effects				
School level effect u_{0j}	0.0511	0.0208	0.0475	0.0212
Individual level effect r_{ij}	1.3241	1.3116	1.3237	1.3112
Fit Statistics				
AIC	2172.2	2162.5	2172.5	2164.4

Note: Bolded coefficients are significantly different from 0 at $p < 0.05$.

DISCUSSION

The results document a low risk of overweight (i.e., 16.6%) and obesity among Grenadian adolescents despite significant sexual dimorphism in the rate of overweight Grenadian adolescents. Female adolescents have far greater risk of obesity compared to their male counterparts. Furthermore, it appears that the greater risk of obesity among the urban students is primarily due to the greater presence of female students in urban schools.

Since the study used the same growth curve cutoffs and procedures used for US adolescents in the NHANES, these rates of OW/OB can be compared with US adolescents. US black female and male adolescents of the same age had three (26.1% versus 8.1%) and four (25.4% versus 6.8%) times the rates of obesity (i.e., BMIz > 95th percentile) compared to their Grenadian counterparts, respectively [30]. With regard to overweight (i.e., BMIz > 85th percentile), US females and male adolescents had two (44.7% versus 21.4%) and three (38.8% versus 12.2%) times the rates compared with their Grenadian counterparts, respectively.

These findings are significant in that they seem to contradict a recent study by the CDC indicating the obesity epidemic has already impacted Grenadian adults. In the CDC study, Block and colleagues [31] found that among Grenadian adults, 42% of women and 17% of men were obese, and across all adult age groups the rate of OW/OB reached as high as 72%. These findings suggest that adolescents in Grenada will undergo a dramatic transition in their rates of OW/OB, such that prevalence among the current female adolescent group has the potential to rise from a current rate of OW/OB of 21% to nearly 72% as they transition to adulthood.

ACKNOWLEDGMENT

The project, titled the Grenada school Nutrition Study (GNS), is funded by the International Research Development Center (IRDC) (Grant #106884).

Grenada and School of Medicine, St. George's University,
St. George's, Grenada, West Indies

ABSTRACT

Life expectancy in Grenada is expected to increase by 10% in the coming decade and, with it, a simultaneous increase in the demand on the healthcare system. Supportive environments and services need to be provided for the aging population and those with chronic diseases. In this chapter, we assess the impact of the Windward Island Research and Education Foundation (WINDREF) Sports for Health program on the physical, social, and mental well-being of the aging population in Grenada. A total of 23 participants aged 65 years and older (22 females, 1 male) were included in this cross-sectional study. A survey was administered at baseline in July 2017 and again after being enrolled in the Sports for Health program for a minimum of seven months and at the end of one year in July 2018. An adapted version of the RAND Health Survey was used. A statistically significant correlation was found between the following quality of life scales among participants: health vs. pain ($p = 0.013$), emotion vs. pain ($p = 0.009$), emotion vs. health ($p = 0.008$) and emotion vs. energy ($p = 0.022$). WINDREF's Sports for Health program has demonstrated that the quality of life characteristics for the aging population improved after participating. Although the sample size was small, the results showed important outcomes that indicate a benefit in community-based programs for the aging population. It also demonstrated the need to encourage more men to participate in such community-based programs.

INTRODUCTION

Internationally, average life expectancy at birth in 1960 was about 52 years, and today, it is over 70 years [1]. There are over one billion people aged 60 years and older in low- and middle-income countries around the world [2]. Countries vary in their life expectancies based on many factors, but this is a massive accomplishment. It is evidence of previous decades of success in coordinated research and practice implemented by leading medical, academic, and public health communities. The public health system has been a guiding force in improving health outcomes resulting in prolonged life and reduced disease burden. It has largely been accomplished by enhancing knowledge through research and establishing public health values around the world. But, with this success has come new challenges, including non-communicable or chronic diseases and the increasing incidence of health issues more closely related to human behavior.

Each decade, a broad theme emerges among the international community, which prioritizes specific challenges to populations on a global scale. Setting agendas in this way is important in order to maintain a coordinated and global effort to achieve new population health goals. The World Health Organization (WHO) has declared the decade 2020-2030 as the international decade for healthy aging, which the organization defines as *the process of developing and maintaining the functional ability that enables well-being in older age* [3]. Simply, every person should have an opportunity to live a long life with the ability to participate to the fullest extent in what they value.

Unfortunately, aging is often equated with an increasing burden of disease and a poor quality of life [4, 5]. It is important to better understand this population and its unique needs. Chronic disease and health-related behaviors are only two of the many factors that influence a person's ability to live a full life as they age. These factors greatly affect the quality of life and are important focus of many interventions. Chronic disease also represents a massive portion of health care expenditure and is likely to gain acceptance among a wide range of organizations as an area of focused intervention.

Influencing human behavior is complex and uniquely challenging, particularly in an age where everything that might be considered "unhealthy" is readily accessible. The ecological approach has been applied successfully in public health intervention planning and implementation aimed at health promotion and changing health-related behaviors [6]. This is a broad theory, but many of its principles focus on the influence of the environment on behavior and the importance of social process and collaborative effort [7]. Contemporary models apply the ecological model in more focused ways and have suggested variations in its application, including comprehensive guidelines on program planning [8, 9]. In general, community-based programs for health promotion have been shown to be effective and sustainable approaches in targeting risk factors of chronic disease and improving health education [10]. This framework may also be applied to programs specifically targeting the aging population.

Sports for Health, Grenada

In Grenada, life expectancy was estimated at 73 years between 2003 and 2005. It is estimated that life expectancy will increase by 10% in the coming decade, which will place an increasing demand on the healthcare system [11]. A recent Pan American Health Organization (PAHO) report stated the need for the Grenadian health system to develop supportive environments and appropriate services, specifically for the aging population [11]. Chronic disease is also an important target for health promotion and intervention among all age groups in Grenada. According to the Ministry of Health, in Grenada, 37% of deaths are due to cardiovascular diseases, 21% due to diabetes, and 26% are due to hypertension [11]. An increase in deaths due to complications of diabetes, along with deaths due to complications from cardiovascular diseases, has also been noted.

Access to health care and services plays a central role in health and well-being. In an effort to address health inequalities in the Caribbean, WINDREF recently established the Caribbean Center for Health Equity (CCHE) at St George's University (SGU) in Grenada. The goal of this center is to coordinate regional efforts and establish a network of partners across the Caribbean in support of education, research, and service in health equity. Among the ongoing projects at the CCHE is the Sport for Health program, which focuses on providing health and nutrition education, as well as a place where members of the community can participate in fitness activities and training. The program is available to all Grenadians, having locations across 5 sporting fields in the parishes of St George, St John, St Andrew, and St David. The implementation of the Sports for Health program appears to follow an ecological approach in its focus on community engagement and creating environments for health promotion activities.

Current Study

The purpose of this study is to assess the impact of Sports for Health on participants over the age of 65 years. While the program provides services to all ages among the Grenadian community, this study seeks to better understand its efficacy in the aging population. The information presented reflected the participant's quality of life and their performance in the program. Although multiple studies have been conducted on the positive impact of participation in health promotion activities in the aging population, there is a need for such studies in developing countries.

The study assessed whether the sports for health program improved the physical, mental, and social well-being of the participants after having completed 12 months in the program. This was determined by comparing baseline survey responses with responses gathered after 12 months. The anticipated primary outcome of the study is that the "Sports for Health Program" will have a positive impact on the physical health and quality of life from baseline to the 12-month time point. The outcomes should show, which scales of quality of life, such as physical functioning, energy, pain, social and emotional well-being will be improved by participating in this program.

Study Design

This was a cross-sectional study that collected survey responses from participants at baseline in July 2017 and after being enrolled in the study for one year, who are henceforth referred to as the 12-month point population in July 2018. The WINDREF Sports for Health program is located across five sporting fields in the parishes of St George, St John, St Andrew, and St David.

OUR STUDY

The survey used in this study was a combination of the RAND Health Survey, along with questions regarding demographic characteristics. The RAND Health Survey is a composition of questions from the RAND 36-Item Health Survey (Version 1.0), which targets the overall well-being of an individual. The validity and reliability of the RAND health survey were demonstrated through the usage of the survey in the Wilson, Hutson, and VanStry study comparing the quality of life amongst breast cancer patients.

The survey in this study was administered to the participants that met the inclusion criteria both at baseline and after one year of participation. These same participants that filled out the first set of surveys also completed the same surveys after one year of participating in the study.

Participants were enrolled for seven months to a year for 11 of the participants (43.5%), and over a year for 12 of the participants (56.5%). A total of 20 (87%) of the participants attend 3-5 exercise sections per week.

Inclusion Criteria

Inclusion criteria for the baseline population was having an age of 65 years or more at the time of enrollment in the Sports for Health program. Participants were expected to continuously attend the fitness sessions at least three days per week for a year. There were no exclusion criteria for the baseline information.

Study Population

The sample population was taken from the whole target population. A total of 23 participants, comprising 22 females and one male, met the inclusion criteria and were evaluated in this study. The average age of the participants was 67.6, with a standard deviation of 1.9. The ages of the participants ranged from 65 to 73 years.

Variables

The dependent variables are the scales for well-being from the RAND health survey and current health indicators found on the demographics survey. The independent variables are the rest of the questions in the demographic survey such as age, length of enrollment, attendance rate, and level of education.

Data Analysis

Descriptive narrative characteristics, such as mean, standard deviation, 95% confidence interval for the mean, upper limit, and lower limit for the continuous variables have been and will continue to be assessed by comparing the baseline and 12-month time point, the males and females, and other variables of interest, in order to visualize the distribution. SPSS was utilized to evaluate the results. Results were charted in Excel.

Table 1. RAND health survey

Characteristic	Mean	SD
Physical functioning	91.3	15.9
The following items are about activities you might do during a typical day. Does your health now limit you in these activities? If so, how much?		
Vigorous activities	67.4	35.7
Moderate Activity	95.7	14.4
Lifting or carrying groceries	95.7	14.4
Climbing several flights of stairs	89.1	21.1
Climbing one flight of stairs	100.0	0.0
Bending, kneeling, or stooping	82.6	24.3
Walking more than a mile	97.8	10.4
Walking less than a mile	93.5	22.9
Bathing or dressing yourself	100.0	0.0
Pain	82.2	22.9
How much bodily pain have you had during the past 4 weeks?	70.4	24.0
During the past 4 weeks, how much did the pain interfere with your normal work?	86.9	22.4
During the past 4 weeks, to what extent has your physical health or emotional problems interfered with your normal social activities with family, friends, neighbors, or groups?	89.1	22.3
General health	77.9	18.8
I seem to get sick a little easier than other people	83.7	17.9
I am as healthy as anybody I know	70.7	25.7
I expect my health to get worse	94.6	10.5
In general would you say your health is?	63.0	21.1
Emotional well-being	77.4	13.1
Have you felt calm and peaceful?	75.7	13.4
Have you felt so down that nothing could cheer you up?	74.8	8.98
Have you been a happy person?	81.7	17.0
Energy and fatigue	74.8	12.4
Did you have a lot of energy?	49.6	13.3
Did you feel worn out?	62.2	12.8

Questionnaire Part 2, RAND Health Survey, was analyzed using a two-step scoring method designed by Hays, Shermbourne, and Mazel [11]. Step 1 in scoring the results was to recode the answer. Each answer was scored according to a range of 0 to 100, with 100 being

the most favorable health state. The questions were organized into scales representing the dependent variables of the study. Step 2 was to organize the questions according to their specific scale, and then the scores of the answers in each scale were averaged. The answers that were left blank were not represented in the average score for each scale. Using this method of determining the average (mean), standard deviation, and p-values helped to determine the reliability, central tendency, and variability of the scales. Statistical significance was considered when the p-value was less than 0.05. The null hypothesis can be rejected for the specific statistical test. All the required statistical tests were analyzed according to a 95% confidence interval, with statistical significance noted as a p-value of less than 0.05.

FINDINGS

The mean and standard deviation are depicted for the participant’s answers from the survey in Table 1. The questions are grouped into four categories; physical functioning, pain, general health, emotional well-being, and energy, and fatigue. Answers to the survey questions have been scored according to a range of 0 to 100, with 100 being *the most favorable health state*. The mean and standard deviation are also included.

The participant’s health vs. pain (p = 0.013), emotion vs. pain (p = 0.009), emotion vs. health (p = 0.008), and emotion vs. energy (p = 0.022) are found to be significantly significant, hence, a relationship could exist between these variables. Physical functioning compared to energy and fatigue are not statistically significant.

A Pearson’s correlation test was utilized to determine if age had a statistically significant relationship with the quality of life scales. According to Table 2, there is only one statistically significant relationship that can be assumed, which is age and emotion.

Table 2. Analysis of quality of life scales

Scales	Age	
Physical	Pearson Correlation	-.194
	Sig. (2-tailed)	.375
	N	23
Pain	Pearson Correlation	.248
	Sig. (2-tailed)	.253
	N	23
Health	Pearson Correlation	.426*
	Sig. (2-tailed)	.042
	N	23
Age	Pearson Correlation	1
	Sig. (2-tailed)	
	N	23
Emotion	Pearson Correlation	.543**
	Sig. (2-tailed)	.007
	N	23
Energy	Pearson Correlation	-.004
	Sig. (2-tailed)	.984
	N	23

* Correlation is significant at the p = 0.05 level (2-tailed).

** Correlation is significant at the p = 0.01 level (2-tailed).

Table 3. Analysis of participant's attendance rates and quality of life scales

Spearman's rho	Enrollment Length	
Physical	Correlation Coefficient	.117
	Sig. (2-tailed)	.595
Pain	Correlation Coefficient	.156
	Sig. (2-tailed)	.477
Health	Correlation Coefficient	.245
	Sig. (2-tailed)	.259
Age	Correlation Coefficient	.020
	Sig. (2-tailed)	.926
Emotion	Correlation Coefficient	.172
	Sig. (2-tailed)	.434
Energy	Correlation Coefficient	.117
	Sig. (2-tailed)	.595

A Spearman's correlation test was applied to determine if participant's attendance rates are associated with their quality of life scales and no significant associations were found between these factors; hence, conclusions cannot be made about their relationships (see Table 3). A graph of these results can be seen in figure 1. To confirm that attendance rates do not act as confounding variables for quality of life scales, an ordinal regression test was performed. The test of parallel lines in the ordinal regression test failed to reject the null hypothesis that the slope coefficients are the same across the response categories. An ordinal regression test assumed that pain, physical functioning, health, and emotion are not significantly affected by the participant's attendance rate.

Figure 1. Quality of life scales.

A Spearman's correlation test was also used to determine if the participant's enrollment length had a significant association with their health scales. Conclusions cannot be made about the relationship between quality of life scales and enrollment length.

DISCUSSION

Community-based exercise interventions have become a growing theme for helping elderly persons improve their health. After the completion of this cross-sectional study, there is hope that this study will continue to recruit more male participants and persons aged 65 years and older, in order to form generalizations about the target aging population and improve validity. It is recognized that there are more females in Grenada's aging population than males, but the difference is not as extreme as shown in this study.

The quality of life and well-being of the participants were determined utilizing a RAND health survey, which categorized the responses according to five health scales. The responses to the survey were scored from 0 to 100, with 100 representing the *most favorable health state*. The highest scale was the participant's physical functioning with a mean score of 91.3, and the lowest score was found in the participant's energy and fatigue with a mean score of 74.8. Since the majority of these participants had been active members of the Sports for Health program for over seven months, additional reasoning behind these results could be that the Sports for Health program has quickly improved the participant's physical functioning.

The age of the participants is also an important independent variable, which is why a Pearson's correlation test was conducted to ensure that age did not act as an effective modifier of the health indicators. According to the test, the health scale for emotion can be assumed to have a statistically significant positive association with emotion ($p = 0.007$). Although the participants in the study might have been attending the exercise sessions in different quantities and at different rates, this shows that their participation appeared to be beneficial to their mental well-being when analyzing their health scales.

Increased knowledge about the effectiveness of community-based interventions can promote the expansion of the Sports for Health program as well as the implementation of programs specific to the aging population. It is an important area of research as Grenada's aging population is expected to increase significantly in the coming decade and will require effective health and well-being programs such as Sports for Health. WINDREF's Sports for Health program has demonstrated that quality of life characteristics for the aging population can be improved with a community-based exercise intervention. Lessons learned and best practices will be shared with other countries through publication of the results.

ACKNOWLEDGMENTS

The authors thank the Royal Grenada Police Force for assisting in the implementation of this community-based service, and the participants in this study. The name for the WINDREF Sports for Health Program was changed to the Baroness Howells Sports for Health Program in 2018 in honor of Baroness Howells, the President of WINDREF, who has a great interest in this program and its outcomes. Funding for this program comes from the Baroness Howells Sports for Health Fund.

ABSTRACT

In this chapter, we examine rural and urban differences in exposure to social and environmental factors believed to be social determinants of obesity among Grenadian adolescents. A nationally representative sample of first-year students (i.e., Form 1) (n = 689) from the twenty-three secondary schools in Grenada was assessed as part of the Grenada School Nutrition Study (GSNS). Various measures of social and environmental determinants of obesity were obtained both at the individual and school levels using surveys or field observations, respectively. Urban (n = 13) and rural (n = 10) schools were determined by school location in relation to the two largest towns in Grenada. Exposure to unhealthy food outlets (i.e., shops selling sugar-sweetened beverages, candy, or highly processed foods) was determined by the density of either snack shops (i.e., bakeries, snack shops, markets, vending zones, tuck shops) or franchise fast food outlets (i.e., KFC, Subway) within a .75 km buffer around each school. Rural students were more

* Corresponding Author's Email: rscribne@sgu.edu.

likely to be Afro Caribbean (89.1% versus 79.3%) and male (55.8% versus 44.1%). Significant differences between rural and urban students were noted for car access (40.7% versus 53.3%), computer access (61.6% versus 73.5%), and snacking after school (83.6% versus 90.5%), respectively. Rural students' school environment had a lower mean density of snack shops (1.53 versus 3.39 shops/square km) and mean fast food outlet density (0 versus 1.17 outlets/square km) than urban students' school environment. For a number of measures, rural students in Grenada had significantly lower exposure to social and environmental factors believed to associated with overweight and obesity.

INTRODUCTION

The consensus among public health experts is that human genetic changes are not responsible for the rapid rise in obesity, and the explanation must lie in broad social determinants resulting in local environmental exposures that influence diet and physical activity [1-4]. A consequence of this new understanding is evidenced in a new overarching goal in Healthy People 2020 [5]. In addition to increasing years of healthy life and eliminating health disparities, the goal of – “creating social and physical environments that promote health” - has been added.

Despite the acknowledged importance of “obesogenic” environments in the epidemic there is little consensus on the aspects of the environment that have driven the epidemic as well as the factors that have given rise to the growing disparities in obesity-related outcomes by race and socioeconomic status [6, 7]. Although researchers have watched the epidemic of obesity unfold over the past three decades, not only in the US but across the globe, identification of the “drivers” of the epidemic remains contentious [8-10]. The effort to characterize the “drivers” of the epidemic involves the identification of the factors responsible for upsetting the balance in the “energy intake/energy expenditure” equation over the past four decades. On the energy intake side, the global food system that provides a “Westernized” diet of cheap, palatable, energy-dense foods is implicated [8, 10, 11]. On the expenditure side, the transition to sedentary occupations with low energy expenditure is implicated [12, 13]. The inability to arrive at a consensus is attributed to the lack of research with designs sufficient to link local obesogenic environments - created by the societal drivers - with individual obesity-related behaviors [6, 14, 15].

The current study is designed to begin to identify these drivers of the global epidemic of obesity in a country that has not yet been affected. The study was designed to identify modifiable factors in the school and local environment that were thought to lead to obesity among adolescents. The study targets adolescents entering secondary school because it is a critical developmental stage when adolescents exercise greater autonomy in their decisions regarding diet and physical activity [4]. Consequently, it is a period when the effects of the school and local environments will begin to have an impact on obesity-related behaviors.

OUR STUDY

The current study is part of a project titled the Grenada School Nutrition Study (GSNS). The GSNS goal is to identify behavioral and environmental factors that might be intervened on to prevent the development of obesity among Grenadian adolescents.

Table 1. Descriptive statistics for demographic, outcome, behavioral, and school environment variables by urban school status for GSNS schools

	N	Overall	Rural Schools (N = 283)	Urban Schools (N = 406)
Demographics				
Age, years	689	12.67	12.81	12.57
Race-Afro Caribbean, %	689	83.31	89.05	79.31
Gender, male	689	48.91	55.83	44.09
Outcomes				
BMIz > 85 th , %	689	17.56	13.43	20.44
Behaviors				
Car Access, %	687	47.89	40.07	53.33
TV Access, %	666	79.43	76.84	81.22
Computer, %	664	68.67	61.62	73.54
Snack after school, %	626	87.70	83.59	90.54
Junk snack, %	676	41.86	40.07	43.11
Walk to school, %	687	15.14	17.44	13.55
MVPA, % wear time	126	8.10	8.77	7.62
Sedentary, % wear time	126	58.90	57.86	59.63
School Environment				
Snack Store Density	23	8.24	1.53	3.39
Fast Food Density	23	0.664	0	1.17

Note: Bolded prevalences are significantly different at $p < 0.05$.

Study Sample

The GSNS was designed to be a representative sample of all first-year secondary students (i.e., Form 1) drawn from the 23 public and private secondary schools across the tri-island nation of Grenada. Form 1 students ranged in age from 11 to 14 years. Randomization was performed at the classroom level resulting in an eligible sample of 1,004 students in 35 classrooms (i.e., in schools with only one Form 1 class all students were included) making up roughly 55% of all Form 1 students in Grenada. Parental refusals ($n = 276$) and students who were absent on the day or did not complete all the assessments or surveys ($n = 39$) resulted in an effective sample of 689 students in the cohort. All students were assigned a unique identifier linked to their informed consent signed by their parents. Personal identifiers in the form of parents' names, phone numbers, and school identification were collected for possible follow up.

Data Collection

Throughout the academic school year, one school was assessed each week. Three formal visits were scheduled at each school during the week. The first day (i.e., Tuesday) involved the collection of anthropometric data: height, weight, and waist circumference. On the second day (i.e., Wednesday), the student survey and the principal survey were conducted. On the third day (i.e., Thursday), the students were instructed on the wearing of accelerometers. They were instructed to wear the device for four days from Thursday through Sunday.

The school food environment assessments were coordinated with the aid of a Geographic Information System (GIS) developed for the GSNS. The extent of the school environment was defined by a .75 km buffer around each school. Within each school environment, project field staff visited each food outlet and conducted a Store Assessment. The location of each school and store was recorded using a Garmin GPSMAO 76CSx. The reading was taken at the most central location within the school or store. The accuracy varied by 3 to 7 feet.

Study Measures

Height, weight, and waist circumference were directly measured for each student in a privatized setting (e.g., trifold blind booth) in normal school clothing. Measurements using a portable stadiometer and electronic scale standardized before each session were repeated three times, and the average score reported.

Body Mass Index (BMI), calculated by dividing weight in kilograms by height in meters squared, was used to assess excess body fat. Due to the greater sensitivity of the Centers for Disease Control and Prevention (CDC) classification system compared with the International Obesity Task Force (IOTF) classification system for characterizing excess body fat in a Caribbean adolescent population, the CDC age- and sex-specific cutoffs were used to characterize overweight (i.e., $BMI \geq 85^{\text{th}}$ percentile) and obese (i.e., $BMI \geq 95^{\text{th}}$ percentile) adolescents in terms of their standardized percentile [16]. Rural and urban designations were defined at the school level. Students attending school in the two largest towns in Grenada (i.e., St Georges and Grenville) were defined as urban students.

Percent time in moderate or vigorous physical activity (MVPA) was assessed using Actigraph GT3X+ accelerometers (ActiGraph, Pensacola, FL). A subsample of adolescents wore the accelerometer at their waist on an elasticized belt for two school days and two weekend days. Non-wearing time and cumulative time spent within specific intensity ranges were calculated using SAS (SAS Institute, Inc, Cary, North Carolina) syntax developed by the National Cancer Institute (http://appliedresearch.cancer.gov/nhanes_pam/). Non-wear time was defined as any sequence of at least 60 consecutive minutes of zero activity counts. The cut points of Evenson and Terry [17] for the various physical activity levels were used, as recommended by Trost and colleagues [18]. A valid day was defined as 8 hours or more of wear, and participants had to have a minimum of 2 valid days to be included in the analysis. Total time spent in sedentary and moderate-to-vigorous intensity physical activity was expressed as a percentage of wearing time.

Figure 1. Map demonstrating school environments for the four schools with food stores.

Measures of the school food environment were developed using the GSNS Geographic Information System (GIS). In the GIS, data for each Store Assessment was linked to the location of the respective food outlet georeferenced relative to the school environments. Consequently, measures reflect the density of specific aggregated store conditions from the Store Assessments in the school environment. The measures included: 1) density of fast food outlets, 2) density of unhealthy food outlets (snack shop density), and 3) density of outlets with healthy foods. Density items were based on outlets per square kilometer in the school buffer area (see Figure 1).

Statistical Analysis

Multilevel models of students nested within schools were developed to characterize the overall and between school prevalence of overweight and obesity across Grenada. For this descriptive analysis, demographic measures including age, and gender were included in the

analyses. The basic multilevel models used a random coefficient for the intercept. Thus at student level, we have the following model,

$$Y_{ij} = \pi_{0j} + \pi_1(\text{Gender})_{1ij} + \pi_2(\text{Age})_{2ij} + \varepsilon_{ij} \quad \text{Level 1}$$

where Y_{ij} is the outcome (e.g., obesity related behavior measurements or BMI z-score) for student i in school j . π_{0j} is the intercept, which we allowed to randomly vary across schools, which also is the estimated mean response for school j . We assume fixed effects for a vector of student level risk factors. ε_{ij} is the random effect of student i in school j , which is assumed to have normal distribution mean 0 and constant variance σ^2 for $i = 1, \dots, n_j$ and $j = 1, \dots, 23$.

The intercept π_{0j} , is allowed to randomly vary across all schools. Therefore, at the school level, we have the following model:

$$\pi_{0j} = \beta_{00} + \beta_{01}W(\text{Urban School})_{1j} + u_{0j} \quad \text{Level 2 (random intercept)}$$

FINDINGS

Rural students were more likely to be Afro Caribbean (89.1% versus 79.3%) and male (55.8% versus 44.1%). Rural students were also less likely to be overweight or obese (i.e., BMIz >85th percentile).

With regard to obesity-related behaviors, significant differences between rural and urban students were noted for car access (40.7% versus 53.3%), computer access (61.6% versus 73.5%), and snacking after school (83.6% versus 90.5%), respectively. In addition, the rural students' school environment had a lower mean density of snack shops (1.53 versus 3.39 shops/square km) and mean fast food outlet density (0 versus 1.17 outlets/square km) than urban students' school environment.

Multi-level analyses were run to try and explain the urban-rural differences in obesity rates in terms of either individual or school environment level factors. In multilevel analysis predicting the risk of obesity, none of the individual behaviors or school food environment measures was observed to explain the urban-rural differences in obesity risk (see Table 2). For example, when access to computers was added to the model, the factor did not significantly predict obesity risk, although greater access to computers was positively associated with obesity risk. In addition, the inclusion of computer access to the model slightly reduced the effect of urban school status on obesity risk, but neither factor was significant (see Table 2, Model 3).

DISCUSSION

For several individual behaviors and school environment characteristics, rural students in Grenada had significantly lower exposure to social and environmental factors believed to be associated with overweight and obesity. However, in multilevel modeling controlling for demographic factors, the individual behaviors, and the school environment characteristics, individual behaviors did not explain the effect of urban school status on obesity risk.

While it is clear that students attending schools in rural parishes of Grenada have a lower risk profile with regard to presumed behavioral factors associated with obesity, explaining the rural versus urban differences were not explained by the individual behaviors measured in this study. Of note is the lack of a difference in MVPA level between the two groups. Consequently, it is unclear why the reported measures - computer use and car access - were significantly different between rural and urban students, given they imply differences in physical activity. Furthermore, the results suggest the difference in unmeasured factors associated with junk food consumption may be implicated. While the school level differences in the availability of junk food were not significant, the large difference in effect does appear to represent a trend given the sample size of only seven.

There were several weaknesses in the study. First, the gender difference related to urban and rural schools is an issue. The fact that females were more represented in urban schools may account for the urban-rural difference in overweight students in urban schools. However, higher socioeconomic status (SES) and high SES is related to car, computer, and junk food access in other studies. It may be that there is an interaction between rural versus urban school attendance and SES where overweight urban females attend rural schools and normal weight rural females attend urban schools, which were considered elite, thus biasing the results to the null. In addition, the accelerometer data was not ideal. In the analysis, students that did not complete the entire program were included in the analysis. Consequently, the lack of difference between rural and urban areas could be due to measurement error.

Finally, there appeared to be urban-rural differences in rates of overweight adolescents. While individual behaviors did not explain the differences there appeared to be confounding by individual SES. For example, computer access, the one behavior associated with overweight status, was significant across all schools but controlling for school status resulted in an insignificant finding. Future studies of rural versus urban differences in overweight and obesity should acknowledge the role of SES interaction biasing results to the null.

ACKNOWLEDGMENT

The project, titled the Grenada school Nutrition Study (GNS), is funded by the International Research Development Center (IRDC) (Grant #106884).

ABSTRACT

Antimicrobial resistance (AMR) is a serious global public health problem. Worldwide, annual mortality is half-a-million people from AMR infections. AMR also results in additional healthcare spending for non-fatal cases. In the presence of growing levels of AMR, further use of antibiotics should conform to relevant current empirical findings. A retrospective secondary analysis was performed on data collected from 2018 for catheter and clean void urine specimens collected at the Grenada General Hospital for uropathogens. The data were compared to the average of the preceding three years, as reported in published literature, to determine their susceptibility to different antimicrobials. The data were submitted after the Institutional Review Board (IRB) approval and redaction of identifiable patient information. A total of 9,054 urine collections were tested and reported for 2018. There were 583 catheter specimens and 8,471 clean void specimens. Those microbes that met inclusion criteria for both specimen types were *Klebsiella pneumoniae*, *Proteus mirabilis*, and *Pseudomonas aeruginosa*. *Klebsiella pneumoniae* and *Proteus mirabilis* were shown to have statistically significant differences in resistance patterns between the published average of the preceding three years (2015-2017) and the 2018 collection. This study provides information on bacterial antibiotic susceptibility profiles of isolates from urine specimens from the Grenadian population. The findings of a trend towards increasing resistance emphasize the necessity

* Corresponding Author's Email: mmontal1@sgu.edu.

of continued surveillance as part of the multimodal strategies recommended in infection prevention control programs. The findings in this study can be extremely useful to assist healthcare providers in planning treatment regimes for patients with urinary tract infections (UTI) in Grenada. Further, the Ministry of Health in Grenada can use the evidence from this study to support framing its response to the World Health Organization's (WHO) call to countries to address AMR and to improve antibiotic stewardship.

INTRODUCTION

Modern use of antibiotics began with the development of penicillin by Alexander Fleming (1881-1955) in 1928. Almost immediately, however, there were concerns that the capacity of these drugs to combat infections would not last. By 1946, Fleming said, “the public will demand [penicillin]... then will begin an era...of abuses. The microbes are educated to resist penicillin and a host of penicillin-fast organisms is bred out which can be passed to other individuals... I hope the evil can be averted.” By 1962 methicillin-resistant staphylococcus aureus (MSRA) had developed in the United Kingdom [1]. Now, the WHO claims that, “without urgent action, we are heading for a post-antibiotic era, in which common infections and minor injuries can once again kill” [2].

There is substantial evidence that antimicrobial resistance (AMR) is a serious health issue. There is presently an annual worldwide mortality of half-a-million people from infections due to AMR [3]. If the situation is left unabated, it is estimated that mortality due to AMR will rise to 10 million people annually by the year 2050 [4]. There is also substantial morbidity in non-fatal cases that contribute to the environmental “resistome,” viz. collection of AMR genes that are cultivated and transmitted among pathogenic microbes. In turn, more robust resistomes require longer durations of treatment for infections. In the United States alone, this leads to an additional \$35 billion, or \$18,000 to \$29,000 per patient, per year [1, 3]. In addition, as the world becomes a global community, there is concern that AMR pathogens will spread to more places and in a shorter time. There is now evidence to suggest that even short durations in transit create more robust resistomes in places such as airplane sewage [5].

To control AMR related impacts, antibiotic stewardship is prudent. However, it has been found that the antibiotic choice for treatment is inappropriate in at least 30% of cases [6]. In Trinidad, it has been shown that at least 62% of surgical prescriptions were inappropriate [7]. To counter this problem, an evidence-based approach should be used to increase the effectiveness of antimicrobial interventions. However, information on AMR for the human population in Grenada is limited. Analyzed data for UTI antimicrobial patterns and other types of infections are very limited. Specifically, there are no data publicly available for uropathogens after 2017 either from private institutions or the global reporting systems such as the Global Antimicrobial Resistance Surveillance System (GLASS) of the World Health Organization [2, 8]. This study was performed to provide evidence of uropathogen AMR prevalence in the population of Grenada from 2018. This information can be extremely useful to assist healthcare providers in planning treatment regimes for UTI in Grenada. The Ministry of Health in Grenada can also use the evidence generated in this study to inform its response to the WHO’s call to countries to address AMR and to improve antibiotic stewardship.

OUR STUDY

A retrospective secondary data analysis was performed for urine samples collected over a one-year period, January 2018 to December 2018, at Grenada General Hospital Laboratory. The data received from the Ministry of Health for the analysis was anonymized. The IRB at St. George's University (SGU) granted approval for the study (St. George's University IRB Ref 19030).

The information provided was WHONET compatible antibiogram data including the year of collection, host, number of samples, type of specimen collected, as well as microbial organism cultured, antibiotic(s) used for susceptibility testing, and the results. Urine clean void and urine catheter specimens were included from both inpatients and outpatients. The microbial organisms isolated from the specimens and reported were *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Raoultella terrigena*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterococcus* sp., and *Streptococcus* sp. The antibiotics used for susceptibility testing were amoxicillin/clavulanate i.e., augmentin, ampicillin, trimethoprim/sulfamethoxazole, ciprofloxacin, levofloxacin, norfloxacin, gentamicin, amikacin, cefazolin, cefuroxime, cefoxitin, cefotaxime, ceftazidime, ceftriaxone, imipenem, and vancomycin.

Inclusion criteria consisted of urine specimens from the Grenada General Hospital Laboratory in the year 2018. Data were excluded if they contained incomplete or unclear documentation, or if the total number of samples collected for a category was limited ($n < 30$). Data that did not meet the criteria nor were included in the publication of the selected preceding years were not used in the analysis. A chi-square analysis was done to assess the level of change in AMR as of 2018 in comparison to published average uropathogen findings in Grenada from 2015 to 2017 [8]. The data were extracted into Microsoft Excel and analyzed using Statistical Package for Social Sciences (SPSS) software.

FINDINGS

A total of 9,054 urine collections were tested, reported, and met minimum inclusion criteria over the 2018 period. Out of the total, there were 583 catheter specimens and 8,471 clean void specimens. Microbes meeting criteria for both specimen types were *Klebsiella pneumoniae*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, and streptococci (see Table 1, Table 2). Of these microbial specimens, a chi-square analysis was performed of the 2018 antibiotic profiles that were of sufficient size ($n > 30$) and had existing data for comparison from the three years prior in the published literature [8, 9]. After implementing these criteria, *Klebsiella pneumoniae* with ampicillin, *Proteus mirabilis* with augmentin, as well as *Proteus mirabilis* with cefuroxime were available for statistical analysis. *Klebsiella pneumoniae* isolates showed a statistically significant increase in resistance against ampicillin, $X^2(1, N = 152) = 11.52$, $p < .05$. *Proteus mirabilis* isolates showed a statistically significant increase against augmentin, $X^2(1, N = 280) = 188.45$, $p < .05$. *Proteus mirabilis* isolates also showed a statistically significant increase against cefuroxime, $X^2(1, N = 146) = 100.03$, $p < .05$.

Table 1. Uropathogens and select resistances (2015-2017)

	Total number from all urine samples (as reported by [8])	Resistant to Augmentin	Resistant to Ampicillin	Resistant to Cefuroxime
<i>Klebsiella pneumoniae</i>	186	36%	80%	27%
<i>Proteus mirabilis</i>	96	36%	48%	24%

Table 2. Uropathogens and select resistances (2018)

	Total number from all urine samples	Resistant to Augmentin	Resistant to Ampicillin	Resistant to Cefuroxime
<i>Klebsiella pneumoniae</i>	271	55%	3%	54%
<i>Proteus mirabilis</i>	4321	92%	40%	84%

DISCUSSION

The data collected in this study show *Klebsiella pneumoniae* resistant to augmentin and cefuroxime, which is the same as reported in a prior analysis of uropathogens in Grenada analyzed from 2015 to 2017 [8]. The current findings shows that since then there has also been a statistically significant increase in *Klebsiella pneumoniae* against ampicillin. Additionally, the current analysis show a statistically significant increase in *Proteus mirabilis* resistance against augmentin and cefuroxime.

There were several limiting factors in this study. It is possible that high levels of AMR over the short time period of analysis were due to low statistical power for certain subsets of specimens. However, the period under investigation may have been of sufficient duration as it has been documented that up to 70% of *Staphylococcus aureus* strains can become resistant to antibiotics, such as erythromycin, within six months of exposure onset [3, 10]. Additionally, as this study used secondary data, there was no way to control factors such as whether there was a lack of refrigeration of the samples, broth contamination, use of a non-sterile container for collection, and less than the minimum recommended volume of urine being submitted for analysis. While the current study had a higher number of total samples, there was also no ability to remove repeated specimen testing or polymicrobial samples. Prior studies from the same population with more stringent criteria of non-repeat monobacterial clinical isolates have yielded fewer samples [11]. Future analyses can better parse patient information by accounting for subsections and collecting demographic data, such as age and gender. This would allow for comparisons to other Caribbean countries for prevalence rates of UTI as well as reported cases of AMR genes such as metallo-beta-lactamases [12].

Findings from this investigation, and similar studies, can support evidence-based prescribing of antibiotics. Constant exposure to antibiotics at low levels promotes virulence through hormesis since the factors that contribute to pathogenicity also act as chemical communication with other microbes when present at concentrations below the threshold of

inhibition [13]. Imipenem at sub-inhibitory concentration levels induces beta-lactamase production in pseudomonas strains, ampicillin at sub-inhibitory concentration levels induce pathogenicity in *Escherichia coli*, and ciprofloxacin at sub-inhibitory concentration levels increase the transfer of pathogenicity factors to *Staphylococcus aureus* [6]. Due to hormesis, it would be ideal to reduce the amount of constant low-level exposure to antimicrobials [1]. With sufficient recent AMR data, there can be shorter courses of antibiotic treatment that do not negatively affect mortality can be encouraged [14].

Novel, more cost-effective search methods, are on the horizon for discovering new antimicrobials. However, they are not yet fully integrated into business models and the effects are not fully understood [15]. Alternative treatment methods are pending but are not yet proven to be clinically or financially effective [16, 17]. The use of biomarkers, such as procalcitonin, and non-antibiotics that demonstrate antimicrobial activity, such as ticagrelor, have not been shown to work independently of antibiotics, rather than augment them [18, 19]. It has thus become increasingly ineffective to financially subsidize private industry as compared to enhancing public health measures, directly [20]. As such, it is more prudent for small island states like Grenada to apply intermediate steps to protect and prolong health through antibiotic stewardship and associated public health interventions.

The data on AMR collected here can work in tandem with extending antibiotic stewardship into agricultural use as well. In the United States, 80% of antibiotics sold are for agricultural and farm use and up to 70% of administered antibiotics exit the body unmetabolized through urine, leading to at least 10% of pharmacologically active compounds being retained even after conventional water treatment [21, 22, 23]. In Grenada, specifically, antibiotic stewardship for poultry farmers can be an important point of intervention [24]. Additionally, effective public health measures, such as vaccinations, should be extended as well. AMR of *Streptococcus pneumoniae* serotype 19A, which is prevalent after introduction of the seven valent vaccine, is decreasing in children under five years in the Latin American and Caribbean region [25]. Implementing vaccinations in aquaculture would not only prevent AMR in water sources but also produce greater yield for farmers [23]. Public health policies should support these measures to protect the health of Grenadian citizens.

In conclusion, AMR is a growing problem and the solution lies in a multidisciplinary approach to intervention as well as generating strong evidence on which to premise actions. The use of data can support the development of measures to promote the physical and fiscal wellbeing of the public, through infection control that reduces the cost and morbidity of infections. This study documents antimicrobial resistance profiles from uropathogens in Grenada collected in 2018. In comparison to published data for the three years prior, 2018 uropathogens showed statistically significant increases in AMR among *Klebsiella pneumoniae* to ampicillin, and *Proteus mirabilis* to augmentin as well as cefuroxime. Although the conclusions of this study should be taken with some caution until further confirmatory studies are performed, other studies have shown there is an overall trend towards increased AMR. This trend highlights the need for continued surveillance in order to adjust future antimicrobial guidelines. With other reported findings, the results from this study can be stored in a database that can be used for AMR reporting and to inform education campaigns for medical professionals and the public, and promoting evidence-based clinical guidelines as well as antibiotic stewardship in Grenada and, more widely, in the Caribbean.

ABSTRACT

Lower respiratory infection is a leading cause of morbidity and mortality worldwide. Pneumonia is an acute form of lower respiratory infection that is characterized by inflammation of the lung parenchyma and ranks as the 4th leading cause of death in Grenada. Pneumonia is categorized either as community-acquired pneumonia or as hospital-acquired pneumonia and can be caused by many pathogens, including streptococcus pneumoniae, hemophilus influenzae, mycoplasma pneumoniae, chlamydophila pneumoniae, influenza virus, coronavirus, and respiratory syncytial virus. The main objective of this study was to describe patterns of morbidity and mortality for community-acquired pneumonia in Grenada during 2015-2019. We retrospectively analyzed the morbidity and mortality of community-acquired pneumonia in Grenada during 2015-2019. Extracted data included the total number of admissions for each month and year; demographic data, including age, and sex; and patient outcomes (survived/died) for those admitted with community-acquired pneumonia. A total of 1,165 patients with community-acquired pneumonia were admitted during 2015-2019. There were 606 (52.0%) women, 557 (47.8%) men, and 2 (0.2%) of unknown gender. The number of cases of community-acquired pneumonia admitted increased significantly over the 5-year period, with 2019 reporting the highest number of cases. The overall case fatality ratio for the 5-year period was 20.5%, with 2015 reporting the highest proportion (29.1%). The proportion of hospital admissions for community-acquired pneumonia

* Corresponding Author's Email: lglasgow@sgu.com.

increased significantly during 2015-2019 in Grenada. There is an exceedingly high case fatality ratio for community-acquired pneumonia.

INTRODUCTION

Lower respiratory infection is a leading cause of morbidity and mortality worldwide [1]. Pneumonia is an acute form of lower respiratory infection that is characterized by inflammation of the lung parenchyma. Pneumonia can be caused by many pathogens, including streptococcus pneumoniae, hemophilus influenzae, staphylococcus aureus, klebsiella pneumoniae, pseudomonas aeruginosa, mycoplasma pneumoniae, chlamydophila pneumoniae, rhinovirus, influenza, parainfluenza virus, coronavirus, and respiratory syncytial virus [2]. Pneumonia is categorized either as community-acquired pneumonia (CAP), in which infection is acquired outside of the hospital setting, or as hospital-acquired pneumonia (HAP), in which infection is acquired after 48 hours of being admitted to the hospital [3].

Data shows that lower respiratory infection is the 4th leading cause of death worldwide [4]. This statistic is mirrored by reported mortality data for Grenada [5]. However, recent data shows that the global mortality rate of pneumonia is on the decline, despite more people above age 70 years dying from pneumonia [6]. Healthcare utilization and cost of hospitalization relating to the treatment of pneumonia is also substantial [7].

The main objective of this study was to describe patterns of morbidity and mortality for community-acquired pneumonia in Grenada during 2015-2019. Our primary hypothesis was that there would be an observable decline in hospital admissions for community-acquired pneumonia in Grenada during this 5-year period.

OUR STUDY

We retrospectively analyzed the morbidity and mortality of community-acquired pneumonia in Grenada during 2015-2019. Data for this analysis were obtained from the Grenada General Hospital medical records department. Grenada General Hospital is the main referral hospital for all public and private health care providers in Grenada. It is a 198-bed secondary/tertiary hospital that includes the only intensive care unit (ICU) on the island and several specialist services. In this study, data were extracted from January 1, 2015 to December 31, 2019. All data obtained from the medical records were de-identified and uploaded in an Excel[®] sheet. Extracted data included the total number of admissions for each month and year; demographic data, including age and sex; and patient outcomes (survived/died) for those admitted with community-acquired pneumonia. The International Classification of Diseases 10th revision (ICD10) [8] coding system was used to categorize acute respiratory infections. Specifically, we analyzed data for Code J18 (pneumonia, unspecified organism). We compared the admission rates of pneumonia regarding age, sex, and month of admission, and examined the trends over the 5-year period. The case fatality ratio for pneumonia was compared for this time period.

Table 1. Number of cases of pneumonia admitted by year and sex

Year	Women	Men	Unknown	Total
2015	76 (51.4)	72 (48.6)	0 (0.0)	148
2016	127 (53.8)	108 (45.8)	1 (0.4)	236
2017	105 (52.8)	93 (46.7)	1 (0.5)	199
2018	147 (52.9)	131 (47.1)	0 (0.0)	278
2019	151 (49.7)	153 (50.3)	0 (0.0)	304
Total	606 (52.0)	557 (47.8)	2 (0.2)	1165

OUR FINDINGS

A total of 1,165 cases of community-acquired pneumonia were admitted during 2015-2019. There were 606 (52.0%) women, 557 (47.8%) men, and 2 (0.2%) of unknown gender. Details are shown in Table 1. The number of cases of community-acquired pneumonia admitted increased significantly over the 5-year period, with 2019 reporting the highest number of cases. In 2019 the number of admissions for community-acquired pneumonia doubled that for 2015. With the exception of 2019, more women were admitted for community-acquired pneumonia during the 5-year period.

Figure 1. Number of cases of pneumonia admitted by year and monthly average.

There was a seasonal variation of hospital admissions for community-acquired pneumonia, with higher numbers being reported during the period of December to March. The annual total and average monthly number of admissions of community-acquired pneumonia cases are shown in Figure 1. The number of admissions for community-acquired pneumonia recorded in 2019 was 9.4% higher than in 2018. The average monthly number of cases has also increased over the same period. Additionally, the number of cases in December 2019 was 61.5% higher than the average over the previous three years (see Figure 2).

Figure 2. Number of cases of pneumonia admitted by year and month.

Figure 3. Number of cases of pneumonia admitted by year and age.

The 65-years and older age group consistently had the most hospitalizations for community-acquired pneumonia during 2015-2019 (with an average of 48.6% over this period). In 2019, 54.6% of all admissions for pneumonia were 65 years and older. The 45-to-64-years age group reported the second highest proportion of hospitalization for community-acquired pneumonia, averaging 24.8% over the 5-year period. An increasing trend in hospitalizations was also observed in this age group (see Figure 3).

The distribution of patients who died from according to year and age is shown in Figure 4. The total number of deaths recorded for the 5-year period was 239, with a yearly average of 48. The highest number of fatalities, 58, was recorded in 2019, in which 20.3% of the deaths were recorded occurred in December. Most of the patients who died from community-acquired pneumonia were 65 years or older, contributing to an average of 70.6% of deaths. The proportion of deaths in this age group ranged from 62.8% in 2015 to 74.6% in 2019.

Figure 4. Number of cases died from pneumonia by year and age.

Table 2. Case fatality ratio for pneumonia during 2015-2019

Year	# Cases (% deaths)		Total
	Women	Men	
2015	76 (31.6)	72 (26.4)	148 (29.1)
2016	127 (22.8)	108 (19.4)	235 (21.3)
2017	105 (13.3)	93 (20.4)	198 (16.7)
2018	147 (16.3)	131 (22.7)	278 (19.9)
2019	151 (14.6)	153 (23.5)	304 (19.1)
Total	606 (18.6%)	557 (22.6)	1163 (20.5)

The case fatality ratio for community-acquired pneumonia during 2015-2019 is shown in Table 2. The overall case fatality ratio for the 5-year period was 20.5%, with 2015 reporting the highest proportion (29.1%). With the exception of 2015 and 2016, men had a higher case fatality rate compared to women. The case fatality rate for each year hovered around 20%, with the exception of 2015.

DISCUSSION

Over the study period, the frequency of community-acquired pneumonia increased significantly, rejecting our hypothesis that there would be an observable decline in hospital admissions in Grenada. Our results are in contrast to global data, which shows that there is a decreasing trend in the incidence of lower respiratory infections [1]. The reasons for this upward trend in incidence are unclear. One possible reason may be the underutilization of vaccination for streptococcus pneumoniae, hemophilus influenzae and the influenza virus. However, a recent report shows that Grenada has 95% immunization coverage [9], but the data did not specify for which diseases. Currently, pneumococcal vaccine is not included in Grenada's national vaccination program. Thus, the immunization data should be closely

examined to decipher whether this is a contributory factor for the increased incidence of community-acquired pneumonia.

Another possible reason for the increased incidence of community-acquired pneumonia may be as a result of increased infection by atypical pathogens [10]. However, our report lacks data regarding the specific pathogens causing community-acquired pneumonia in Grenada. This is because there is minimal testing for the causative agent of community-acquired pneumonia. Grenada has one state-owned clinical laboratory that performs public health functions. This laboratory does not have the capacity to test for and identify viral respiratory pathogens.

Similar to other data [11], our results showed that elderly persons were more likely to be diagnosed with community-acquired pneumonia. Thus, this demographic should be the target of interventions aimed at preventing the disease and its complications. Our results also showed a seasonal variation in the hospitalizations of community-acquired pneumonia, mirroring other studies [6, 12]. Grenada depends heavily on tourism as a pillar of its economy and increasing numbers of tourists visit the island each year. Moreover, the “flu season” in North America coincides with the winter tourist season and thousands of visitors travel to Grenada by air and sea. Thus, this increases the risk of importation of respiratory pathogens into Grenada, which can even initiate an epidemic. In addition, our report had similar findings to a study by Choi et al. [13] regarding gender differences in hospitalized for community-acquired pneumonia, in which men had increased risk.

Our results showed that pneumonia has a high fatality rate, particularly in the elderly. On average, about a fifth of patients admitted for pneumonia during 2015-2019 has died. The Ministry of Health, being the custodian of the healthcare system in Grenada, should consider the lessons of 2019 in preparing for future “flu seasons”. It is imperative that The Ministry of Health intensify its preventive efforts in order to curb the incidence of respiratory infections. Public service announcements should be released in the media outlining measures that can be taken to prevent the disease. Currently, hand hygiene and cough hygiene are being recommended as preventive measures. The influenza vaccine should also be promoted, targeting the groups at increased risk. There is also a need for effective surveillance at ports of entry so that respiratory infections can be rapidly and easily identified, and persons quarantined, if necessary. In this “flu season” and with the advent of COVID-19, surveillance has dramatically increased in Grenada and around the world. However, this initiative should continue in the years to come.

Even though there are challenges in detecting the cause-specific pathogen for pneumonia, with comprehensive molecular testing, pathogen detection can be significantly improved. However, adequate and appropriate treatment should be readily available for patients diagnosed with lower respiratory infections. Presently, there is no antiviral treatment available to treat patients requiring medication. Additionally, no antiviral influenza medication was available in Grenada in 2019, both in the private and public sectors. Seasonal influenza vaccines are usually made available to groups at risk.

This study had several limitations. Firstly, this study was conducted using secondary data from Grenada’s main public hospital. The study only represents cases with severe enough disease to require hospitalization and does not include cases treated ambulatorily. As such, morbidity and mortality due to community-acquired pneumonia in the state of Grenada cannot be generalized from these results. Secondly, data on comorbidities, laboratory confirmation information on cases and, apart from age and sex, data on other risk factors were

not available for this study. Underlying health issues and the pathogen causing disease may have had a great impact on the outcomes observed in the study. Lastly, information on the adequacy of the treatment regimens was not analyzed; this too may have provided further insight into the outcomes observed. Further research is therefore suggested to identify the factors associated with admission and mortality due to community-acquired pneumonia in Grenada.

In conclusion, the proportion of hospital admissions for community-acquired pneumonia increased significantly during 2015-2019 in Grenada, and the case fatality rate of community-acquired pneumonia is exceedingly high. Measures have to be taken to improve vaccination in order to prevent lower respiratory infections. In addition, comprehensive molecular testing should be done to accurately identify causative pathogens of lower respiratory infections. Finally, there is a dire need for medications to treat lower respiratory infections caused by viruses.

ABSTRACT

In this chapter, we examine the effectiveness of the flood early warning system utilized by Trinidad and assess the multisectoral response to mitigate the health impact of flooding. The work consisted of two components. Firstly, a qualitative, key informant interview process was conducted, examining factors related to timeliness of early warning alerts, multisectoral impact including health, emergency response efforts, and recommended mitigation actions. Interviewees sampled were purposively selected from different sectors and were directly involved in the flood response. Consent was obtained before proceeding with interviews and transcriptions were analyzed using thematic analysis. The second component, targeted at assessing health impacts of flooding, collected and descriptively analyzed syndromic disease surveillance data from health centers serving flood-affected areas. Seven key informants in total were recruited from three organizations, including two local government regional corporations, the Ministry of Health, and a local Non-Governmental Organization. Major factors that led to the flooding included a combination of poor urban planning and development and unusually heavy precipitation within a short period of time that led to severe riverine flooding in

* Corresponding Author's Email: boodrala@carpha.org.

North Central Trinidad. Households, entire communities, businesses, schools, and the agricultural and health sector were impacted. Syndromic surveillance conducted at health centers in the north-central area described a post-flooding rise in respiratory and gastrointestinal disease cases. The October 2018, Trinidad flooding event tested several organizational emergency response systems within the country. Climate resilience must be considered in health sector planning to strengthen surveillance systems and appropriately respond to health disasters.

INTRODUCTION

The Caribbean Region is particularly vulnerable to natural disasters, such as hurricanes, flooding, and drought. Climate change, which influences hydrometeorological events, is driven by global warming and is of major concern for Small Island Developing States (SIDS) in the Caribbean. The Intergovernmental Panel on Climate Change (IPCC) 2007 report details an observed 0.2°C increase per decade in the Caribbean region over the last 30 years [1].

The period June 1 to November 30 each year marks the Atlantic Hurricane season [2]. Over the past few years, the region has seen a rise in the frequency and severity of storms, including three Category 5 storms within the last two years [2], which heavily impacted human life and island economies. Over the last 30 years, climate variability, regional warming, and modifications in rainfall patterns have been recorded by Caribbean islands, however, climate change is responsible for a shift in the range and pattern of this variability [3].

Rainfall in Trinidad and Tobago varies across the two islands and within each island. Local and remote climate influencers such as El Niño and La Niña phases of the El Niño Southern Oscillation (ENSO) play important roles with respect to rainfall patterns. There also exists a strong relationship between local rainfall variability and the Inter Tropical Convergence Zone (ITCZ), which is linked to prolonged rainfall periods in Trinidad and Tobago [4].

On October 16, 2018 the Trinidad and Tobago Meteorological Service (TTMS) issued its first early warning message of a potential major flooding event in Trinidad, approximately 72 hours before the start of the event. This was followed by a yellow alert Common Alert Protocol (CAP) during the 17th – 19th October, which detailed an active ITCZ that would lead to flash flooding. On October 18, 2019 the TTMS upgraded their alert to the orange level, which was further escalated to the red level, projecting extensive riverine flooding along the Caroni River, and advising citizens to protect life, livelihood, and property (K. Kerr pers. comm. 11 February 2019).

Following this, a major flooding event occurred across the north-central and eastern parts of Trinidad, which resulted in the Trinidad and Tobago Government declaring a natural disaster and engaged all levels of response from national to local government, as well as civil society and community relief efforts. Communities along the Caroni flood basin were heavily impacted, with evacuations being necessary in some cases. Reports from the Trinidad Office of Disaster Preparedness and Management (ODPM) and the Caribbean Disaster Management Agency (CDEMA) indicated that flooding impacted 100,000 to 150,000 people, with 800 people being evacuated and 300 seeking shelter support [5].

This report aims to examine the effectiveness of the early warning system utilized by the Trinidadian authorities, assess the multisectoral response that evolved to mitigate the impacts of flooding, inclusive of the health outcomes, and make recommendations for future mitigation efforts.

OUR STUDY

This study consisted of two components; the first utilized information gained through semi-structured, key informant interviews. The interview protocol sought information on various factors, including timelines of alerts issued by the relevant authorities, factors that contributed to the flooding event, impact on various sectors including health, success of the response efforts, and recommendations for future mitigation actions. Interviewees sampled were purposively selected, held key positions within their organizations, and were directly involved in the flood response process. Interviewees were selected from different sectors, including emergency and disaster response, public health, and civil society. Consent was obtained before recording and assurances were given that anonymity would be preserved. No personal identifying information was collected. Notes and audio transcriptions were manually reviewed and categorized using thematic analysis. The results were summarized and are presented in the section below.

The second component, targeted at assessing health impacts of the flooding, was based on collecting and analyzing syndromic disease surveillance data from health centers serving flood-affected areas. Syndromes/disease classifications examined included respiratory infections, acute viral illness, and gastroenteritis.

FINDINGS

A total of seven key informant interviews were conducted, inclusive of four personnel from the local government regional corporations, two from the Ministry of Health, and one from a non-governmental organization (NGO). The local government corporations directly serviced the flood-affected areas.

Timeliness of Alerts

Official warnings from the Office of Disaster Preparedness and Management, as well as the Meteorological Office were dispatched, however, the reach and timeliness of the messages were not consistent throughout the response community. In one instance, the local government office acted independently of these alerts based on community reports received. Other response offices indicated satisfaction with timely alerts. Messages to the general Trinidadian population were disseminated on local television, radio channels, the TTMS website, and social media beginning three days prior to the start of the flooding event.

Factors Contributing to Flooding

The main contributors to the major flood event of October 2018 were proposed to be a combination of poor urban planning and drainage development, as well as the timing of hydrometeorological events. Main areas affected included North Central Trinidad (primarily the Caroni river flood basin) and Sangre Grande on the Eastern side of the island and Mayaro in the south. Communities built close to the river flood zone were impacted first. Between 17-19 October 2018, Trinidad experienced one month's worth of rainfall. Some meteorological weather sub-stations reported between 6-10 inches of rainfall over the three days, with areas such as Sangre Grande, North Oropouche, San Rafael, Carapo, Talparo and Guaico Tamana receiving 12-14 inches. This unusually large amount of rainfall in such a short space of time, coupled with high tides, prevented riverine and land runoff, resulted in the Caroni River overflowing its banks at several points, leading to inundation of surrounding communities and farms. Other factors included blockage of riverine systems due to improper solid waste disposal practices by local communities living near the river.

Impact of Flooding Event

Within the private sector, several whole communities in the north-central area, including St. Helena, Kelly, Las Lomas, Greenvale, as well as Sangre Grande in the east, and Mayaro in the south of the island were inundated with floodwaters. Levels reached greater than four feet high in the community of Greenvale, which required evacuation. Personal items such as clothing, household items, and appliances, furniture, and electronics were lost. Homes and buildings suffered infrastructural damages, and vehicles were also damaged by floodwaters. In the agricultural sector, crops and livestock were lost, and many local businesses suffered losses. Major transportation routes, such as the Uriah Butler Highway, were impassable to regular traffic for two days, and roads in and around the aforementioned communities were also impassable. The main commercial airport, Piarco, was also closed due to runway flooding. Schools in affected communities were closed.

Due to the impassable roads, some health facilities could not service the local population due to persons' inability to get to and from the health centers, more so in the Eastern region. Some of the facilities that were directly impacted were the Sangre Grande General Hospital, the Mayaro Emergency Health Services, and the St. Helena Health Centre. Health care staff servicing facilities were unable to commute and assist in response efforts.

Response Efforts

As reports were received about the severity of flooding, response teams from the Trinidad and Tobago Regiment, the Trinidad and Tobago Police Service, the National Fire Service, and staff members of the Regional Corporations and NGOs, were mobilized to help communities. The ODPM, under the Ministry of National Security, coordinated the national level response, whereas, the Regional Corporations, which have local emergency and disaster response units, coordinated the community-level response. Areas first affected were Sangre

Grande and Greenvale. Shelters were opened to accommodate those whose homes would have been affected by the floods. Rescue teams went out using boats and trucks to help rescue trapped persons in order to take them to the aforementioned shelters and health centers, where they could be assessed and treated as necessary. Some of the affected persons included vulnerable groups such as pregnant women, the disabled, and the elderly.

Mental health professionals were also deployed to shelters and health centers to provide counseling for persons who were traumatized by the event, however, the uptake of this service was limited, with affected persons focusing on accessing medical treatment services for illness and injuries. On the national level, citizens, faith-based organizations, businesses, schools, and NGOs mobilized resources from the population and supplied toiletries, food household items, and clothes to affected communities. The government of Trinidad and Tobago supplied monetary compensation to flood-affected victims to assist in the purchasing of clothing, furniture, and aid for small home repairs.

Syndromic Disease Surveillance

The flooding event occurred during epidemiological week 42. Limited syndromic surveillance data were available from health centers serving affected communities in the north-central area. Primarily respiratory and gastroenteritis data were collected. Health centers recorded no data recorded for undifferentiated fever syndrome. Increases were seen in acute respiratory infection in both the < and > 5-year age groups in the eight weeks following the flooding event (see Figures 1 and 2). A similar pattern was seen with gastroenteritis data in both the < and > 5-year age groups (see Figures 3 and 4). The local surveillance system also captures acute viral illness with the number of cases recorded higher during the eight weeks post-flooding (see Figure 5). No baseline or epidemic threshold data were obtained for the reviewed weeks.

Figure 1. Cases of acute respiratory infection <5 years by epidemiological week, 2018, in North Central Trinidad Health Centres.

Figure 2. Cases of acute respiratory infection >5 years by epidemiological week, 2018, in North Central Trinidad Health Centres.

Figure 3. Cases of gastroenteritis <5 years by epidemiological week, 2018, in North Central Trinidad Health Centres.

Figure 4. Cases of gastroenteritis >5 years by epidemiological week, 2018, in North Central Trinidad Health Centres.

Figure 5. Cases of acute viral illness by epidemiological week, 2018, in North Central Trinidad Health Centres.

DISCUSSION

In Trinidad and Tobago, the highest rainfall and flood associated events are typically observed during November, however, over the last few years, a potential shift may be seen towards October [3, 4]. Above-average rainfall during three days in October 2018 precipitated what has been termed as an unprecedented flooding event in Trinidad, which impacted on a large scale communities, transportation routes, the agriculture, business, education, and health sectors. Additionally, the destruction of vegetation through bush fires/farming activities along the Northern and Central range of Trinidad, impacts on watersheds, further worsening flood events.

The early warning alerts issued by the TTMS were provided to the public and response agencies allowed most communities to prepare for the potential flooding event. The color-coded nature of these alerts targeted attention to the gravity of the developing situation, allowing response agencies and citizens time for some level of preparation. Social media was

noted as being heavily used in the dissemination of messages. In terms of the effectiveness of the response, a noted disparity was a certain degree of disconnect between the emergency/disaster response units of the Regional Corporations and the ODPM. The Corporations largely acted independently within their areas of responsibility with limited communication and coordination between the local and national level response systems.

Floodwaters pose immediate dangers to human health, and long-term effects result from displacement and worsened living conditions. Of particular concerns following flooding is the rise in communicable diseases, such as food and water-borne diseases, respiratory disease, and arboviral/mosquito-borne diseases [7]. While mosquito breeding sites may be washed away during flooding events, residual pooling post-flooding creates new breeding sites, increasing the transmission potential of viruses, such as Dengue, Chikungunya, and Zika [7]. Injuries during flood incidents are quite common, and the stress levels and trauma experienced by both flood victims, as well as relief and aid workers, are well documented [8]. Where flooding impacts transportation routes, this limits access to health services and medicinal supplies, which will also affect persons with chronic disease. In the October Trinidad flooding, access to health care was largely available, with the limitation more being seen in the inability of health care staff from flood-affected areas to commute and provide services at facilities. Future emergency response plans should describe mechanisms to mitigate the effects of major routes impacted by flooding.

Interpretation of the limited syndromic surveillance data available from health centers servicing affected communities was difficult. Baseline/threshold levels are not calculated at the local levels of the surveillance system and as records are paper-based, access to data to generate baselines is often not feasible. Data from local levels are aggregated and forwarded to the national level. Hence, for the weeks investigated, a determination cannot be made as to whether the rise in cases of acute respiratory infection and gastroenteritis was unusual for the period observed. The majority of health centers did not collect disease-specific data, either due to lack of human resources, limited coordination among sentinel physicians, lack of training, or limited collection of specimens to facilitate diagnostic testing confirmation. Of note, is that the St. Helena health center reported the highest number of cases across all syndromes (see Figures 1-5), however, a determination cannot be made about the reliability of this data or whether the pattern seen is an artifact due to a higher level of focus on reporting in this center.

In Trinidad, the classification of disease under acute viral illness is broad/nonspecific. In many instances, if regional syndromic classification guidelines are adhered to, the majority of viral cases would be reallocated under respiratory or undifferentiated fever syndromes [9]. This points to the need for continuous training and sensitization of physicians and surveillance personnel. Although no deaths resulted from the flooding event, the lack of continued post-disaster surveillance in the weeks/months that followed as services and lives were disrupted does not allow for an effective assessment of health impact. Post-disaster surveillance should also include shelter surveillance encompassing areas such as environmental health, food safety, water quality, and even pet/companion wellness. Syndromic, disease-specific surveillance, and mortality surveillance are critical.

Within the Caribbean, health systems need to rapidly increase their transition to climate resiliency to manage projected reductions in food quality and security, increases in water stress, increases in the magnitude and frequency of extreme weather and climate events, increases in the geographic range of mosquito-borne diseases, and changes in the burdens of

other climate-sensitive health outcomes. Resilience strategies can include improvements in emergency flood notifications; improvements to infrastructure that accommodate river flow; community education and outreach campaigns; restoration of watersheds and stricter enforcement of urbanization and development. The October 2018 Trinidad flooding event tested several response systems within the country. While the efforts at the local and national governmental levels are to be commended, improvements are required in terms of having coordinated, integrated responses. There is also a strong need to improve disease surveillance capacity at the local health center/sentinel site level to generate accurate, detailed data for timely public health action and response.

Key informant interviews were conducted with persons from the Regional Corporations, the Ministry of Health and NGOs/Civil Society. Groups such as the ODPM, Ministry of Social Development, faith-based organizations, and schools were unable to be included during the project time allotted for the interview process. Also, as baseline and threshold health data were unavailable for the weeks investigated, it is unknown if the rise in cases of acute respiratory infection and gastroenteritis was unusual for the period of time observed.

ACKNOWLEDGEMENTS

This work was supported through a grant from the National Oceanic and Atmospheric Administration International Research and Applications Project (NA18OAR4310338).

consideration of the inner qualities (i.e., being) of leaders. While skills are important, leaders with skills are just technicians or technocrats who are driven by their basic motives of acquiring fame or earning more money. However, true leaders are motivated by caring concern and moral values. Eight universities funded by a private foundation worked together to develop service leadership education. In this book we wish to document the achievements in different institutions and highlight the specific projects with different foci. We earnestly hope that through the publication of this book, service leadership education can flourish in different service economies.

INTRODUCTION

Leadership education is an important business for many sectors, particularly the business sector. Many leadership programs have been developed to nurture business leaders who can maximize the profits of the companies. There are also many elitist leadership training programs, which attempt to promote the leadership abilities of professionals in different disciplines. In the business world, leadership development programs are expensive. Meanwhile, there is a strong need to promote leadership development among students before they enter the workplace.

While it is good to see there are many leadership programs in the market in different parts of the world, there are several limitations of the existing leadership programs. Primarily, most of the programs focus on skills (i.e., doing) of leaders without much consideration of the inner qualities (i.e., being) of leaders. While skills are important, leaders with skills are just technicians or technocrats who are driven by their basic motives of acquiring fame or earning more money. However, true leaders are motivated by caring concern and moral values. Besides, with the change of the global economies shifting from the manufacturing mode to the service mode, the requirements for successful leadership under the service economies have changed [1]. For example, while leaders are expected to be authoritarian and top-down in the traditional manufacturing economies, desired leadership qualities include distributed leadership where bottom-up decisions are valued [2, 3].

Another important leadership quality that differentiates manufacturing economy and service economy is the role of moral character. While leaders emphasize “doing things right” in the manufacturing economies, the focus is shifted to “doing the right things” in the service economies. Finally, knowing how to care about other people is an important service leadership quality. As service providers, service leaders must care about the customers not simply because of maintaining good “PR” with the potential customers. In fact, genuine concern about people is intrinsic to service leadership. Furthermore, a successful service leader is one who shows concern about the followers [2, 4]. As Habecker remarked, “true leaders are motivated by loving concern rather than a desire for personal glory” [5].

The final observation of the leadership literature is that there are few validated leadership programs in the field. There are two main reasons why systematic and validated service leadership programs are important. First, with the emergence of service economies, university students should develop more “soft skills,” such as communication skills, ability to cope with adversity, and ethics, which are not systematically covered in the formal curriculum. Hence, when we talk about helping university students to develop in a holistic manner, service leadership education that emphasizes competencies, caring disposition and moral character is

indispensable. Second, service leadership education can help to enhance the employability of university graduates. In fact, many employers are complaining that university graduates do not really suit the job demands within service economies. There still remains a gap between what the employers want from their employees and what the graduates possess [6]. Service leadership education that is designed to meet the demands of service economies would help to fill this gap.

With reference to the above considerations, it is argued that there is a strong demand for service leadership in service economies. This is particularly the case for Hong Kong because service constitutes roughly 93% of the GDP of Hong Kong [7]. With the support of the Victor and William Fung Foundation, an initiative entitled “Fung Service Leadership Initiative” was launched in 2012 to support eight universities funded by the University Grants Committee (UGC) of the Government of the Hong Kong Special Administrative Region to develop service leadership education. In the past years, colleagues in the eight UGC-funded institutions have worked very hard to develop service leadership curriculum in Hong Kong with several major components. First, credit-bearing service leadership subjects covering the basic tenets, core beliefs and subject matters of service leadership have been developed. To illustrate this point, colleagues have developed a credit-bearing subject entitled “Service leadership” and symmetrically evaluated its effectiveness [8, 9]. Besides, credit-bearing subjects related to service leadership, such as social entrepreneurship, service learning, and general education have been designed. Second, non-credit-bearing service leadership programs have been developed. In particular, service learning programs have been developed and implemented to promote service leadership qualities in university students. Third, curriculum materials such as videos, exercises, experiential learning activities have been developed.

Finally, research projects have been carried out to expand the knowledge base of service leadership education in Hong Kong. For example, colleagues have done work to assess service leadership qualities. Effort has been made to examine the views of major business leaders on desired service leadership qualities. Most importantly, studies have been carried out to evaluate different service leadership initiatives and to examine the impact of different service leadership initiatives on the development of service leadership qualities in the students.

To document the achievement of the Fung Service Leadership Initiative, an international conference was held in May 2014. The keynote speeches and presentations are documented in a book [10]. To wrap up the Fung Service Leadership Initiative, a wrap-up conference was held in January 2016. Again, through this book, we wish to document the achievements in different institutions and highlight the specific projects with different foci. Same as the last book, we earnestly hope that through the publication of this book, service leadership education can flourish in different service economies.

ACKNOWLEDGMENTS

The Fung Service Leadership Education Initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

ABSTRACT

At the City University of Hong Kong (CityU), quality professional education and whole-person development go hand in hand. With the advent of the four year curriculum and CityU's emphasis on Discovery-Enriched Curriculum, new opportunities exist for innovative teaching, knowledge transfer, and student service leadership education. In particular, a major development was the development of a 'Social Entrepreneurship Initiative' in 2011 that evolved rapidly into a broad interdisciplinary platform of 30 faculty members that is now branded as Project Flame, Social Innovation and Entrepreneurship@CityU (Project Flame). With generous sponsorship from the Victor and William Fung Foundation, and building upon the curriculum framework developed by the Hong Kong Institute of Service Leadership and Management, Project Flame is committed to improving Service Leadership in Hong Kong. Based on these inputs, with additional funding provided by CityU, Project Flame delivers a vibrant range of cross-disciplinary and sectoral programs to foster the emergence of a new generation whose members possess the service values and leadership skills required to become the service leaders in our region. This chapter introduces briefly Project Flame's key program areas - Professional and Academic Education; Social Innovation Incubation; Research and Knowledge Transfer; and - the focus of this paper - Student Service Leadership. With its multi-disciplinary and community-focused approach, Project Flame's social innovation and entrepreneurial activities enable students and staff to enhance their knowledge, skills

* Corresponding Author's Email: ychandra@cityu.edu.hk.

and experience in service leadership. The chapter outlines Project Flame's unique approach, key activities, and concludes with brief reflections and a look at the future direction ahead.

INTRODUCTION

As a higher education institution, the City University of Hong Kong (CityU) is committed to fostering the growth of a new generation of leaders in various professional fields and sectors. With its wide range of taught, experiential courses; its hosting of international conferences on social innovation, social enterprise start-up and scale-up; and its research activities that include the development of the Hong Kong Social Enterprise Endorsement Mark, CityU is widely recognized as a leading player in promoting social innovation and entrepreneurship in Hong Kong. Supported by the generous sponsorship of the Victor and William Fung Foundation and building upon the curriculum framework developed by the Hong Kong Institute of Service Leadership & Management Ltd., CityU is determined to promote quality Service Leadership Education in Hong Kong. It is achieving this goal through a series of curricular and extracurricular programs designed to foster and sustain younger generations in becoming service leaders in the region.

In the fall of 2011, an informal 'Social entrepreneurship initiative' was established on a voluntary basis by a group of like-minded staff. This has since evolved into a broad interdisciplinary platform of 30 faculty members from 18 academic and support units. Now branded as Project Flame, Social Innovation and Entrepreneurship@CityU (Project Flame), Project Flame's vision and agenda encompass programs that directly address the core beliefs, ethics and concerns of Service Leadership and Management (SLAM) education. Keys amongst these are the beliefs in the importance of character, that everyone is a leader, that leadership is a service for satisfying the needs of others and oneself, that the server is the service, and that values relating to trust, respect and fairness are essential ingredients for leadership effectiveness [1, 2]. The synergies between SLAM Education and our social entrepreneurship initiatives distinguish Project Flame's and CityU's approach to Service Learning education from those of other institutions.

APPROACH AND ACHIEVEMENTS

From the start, Project Flame applied and adapted the original SLAM intellectual framework to its integrated framework of social innovation, entrepreneurship and student service leadership. The grant from the Li and Fung Foundation and the government matching scheme, augmented by internal funding for course and program developments, provided Project Flame with the resources required to build up a strong support team to carry out its programs.

Project Flame's approach to SLAM is infused with the values and programs of social innovation and entrepreneurship, and is implemented via four program areas, namely: *professional and academic education; student service leadership; innovation incubation; and research and knowledge transfer*. Our achievements thus far are outlined below.

Professional and Academic Education

The academic educational program provides a sustainable platform to deliver SLAM education. We have designed a coterie of Gateway Education (GE) courses and also Hong Kong's first Minor in Social Entrepreneurship. Our initiatives in undergraduate teaching of social entrepreneurship compares very favorably with universities abroad, most of which concentrate on postgraduate programs. In our pedagogical approach, our innovative teaching methods include experiential learning, practical orientation, student engagement, design thinking and practitioner sharing. Rich experiences of co-curricular learning are provided through student internships, study tours, competitions, service learning activities, seminars and media interviews on student projects.

Initial GE courses included: Enhancing Your Service Leadership for the 21st Century; Make a Difference: The Challenge of Social Entrepreneurship in a Globalized World; Changing Our Society: Turning Social Problems into Business Opportunities; Social Innovation and Entrepreneurial Venture Exploration; and Professions in Hong Kong: Critical Insights and Issues. Between them, these courses expose students critically to key knowledge, skills and values of effective service leadership that includes the characteristics and dimensions of quality service leadership as developed by Chung [1, 2]. They encourage deep learning through a combination of classroom teaching, experiences, reflection and application. They provide opportunities for practical training in service leadership through, for example, discussions of the roles of social innovation, entrepreneurship, civic engagement, and leadership in solving community problems. Guest lectures by local and international leaders in the fields of social innovation and enterprise, together with class visits to local social enterprises or service organizations, provide students with opportunities to identify role models and to learn from such individuals' and organizations' experiences, successes and failures. Students become engaged in social problems identification and social innovation incubation through participation in various team-based projects that require them to develop their own innovative solutions. Their ideas and plans are presented to panels of expert practitioners for their objective analysis and critical appraisal. The course entitled Professions in Hong Kong, Critical Insights and Issues broadens discussion of service leadership to the requirements of various service professions as well as to the career development of the students. The cumulated total enrolment in all our GE courses since the first offerings in 2012/2013, has already exceeded well over 1,000.

A milestone in curriculum development is the introduction of our interdisciplinary Minor in Social Entrepreneurship. This consists of a core course, Fundamentals of Social Entrepreneurship, and four elective courses that students select from a wide range of courses offered by the Departments of Public Policy, Applied Social Sciences, Management, Marketing, and the College of Business. One noteworthy elective course is Meeting Social Needs through Business Approach. This enhances the service leadership learning of the students and is also offered as a free elective to all other undergraduate students in the university.

Student Service Leadership

Our Student Service Leadership program aims to create direct experiences for students to participate, observe, and reflect on leadership qualities and challenges in various service settings. Particular attention is given to key aspects of service leadership and SLAM core beliefs, such as the importance of the concepts that leadership is a service and that everyone holds a position as a leader - whether in leading their own lives or been dealing with others and with complex situations. As such, there is always room for improving leadership effectiveness and this means that aspects of character, service commitment and various role and task competencies can and should be improved continuously.

Our student service leadership activities place an emphasis both on developing competencies and on learning from others who have proved successful in improving their own competencies and in serving the needs of others effectively and ethically. Agency visits for students have included those such as to the Hong Kong Observatory, North Point Police Station, New Life Psychiatric Rehabilitation Association, New Life Restaurant, Tung Wah Group of Hospitals, Dialogue in the Dark, Senior Citizens Home Safety Association, Green Ladies, Jockey Training School, Chef's Noodles, i-Bakery, Hong Kong Fair Trade Power, Microforest, and many more. Many social entrepreneurs have joined our classes to share their personal experiences and observations on leadership. For example, to kick-start the launch of our Minor, Professor Andreas Heinecke, the Founder of Dialogue in the Dark, gave guest lectures for three weeks with overwhelming response from the students such that he has since returned to hold even more classes for us.

Our international Internship Programs reflect the SLAM framework's recognition of the impact of globalization and the new opportunities this raises for caring, ethical service leadership. Internships provide the students with opportunities both to learn from those they are attached to, and to make a meaningful contribution to their activities. The first internships took place offered in Zhongshan City, Guangdong, with eight students working alongside interns from Beijing to undertake planning and promotion work for social innovation projects. In 2014, eight students took part in an internship program in Shanghai and, in June 2015, twelve students, selected from well over 100 applicants, undertook internships in a variety of social innovation and enterprise organizations in Singapore. In summer 2016, seven students were placed as interns with the Hondao Senior Citizens Welfare Foundation in Taiwan.

International study tours have included fifteen students going to study social enterprises in Singapore, fourteen students joining other students from Taipei, Shanghai and Hong Kong in a social enterprise exchange tour to Shanghai, and another fourteen students taking part in a study tour to social enterprises in Taipei. In January 2016, 14 students visited Social Enterprises in Shanghai and Suzhou where they gained exposure to social innovation ideas, issues and welfare practices in China.

In 2015, Project Flame was invited for the first time to take part in Project WeCan, a service project to provide leadership training and to meet needs of under-privileged secondary schools in Hong Kong. Initially, over 100 students were recruited to serve two schools in Kowloon East, and we are now serving three schools. Our students gain opportunities to serve and develop their leadership competencies while supporting the underprivileged or ethnic minority students from our partnering secondary schools. Activities have included holding experiential workshops to help school pupils to understand some of the practical issues facing

the elderly and to enhance their communication skills. Our students have led school pupils to visit an elderly center and a care and attention home, have facilitated English oral practice workshops, have led pupils on various outings, and have also hosted pupils from the schools for an experiential day visiting the CityU campus and learning about life as a university student. A particularly challenging activity has been holding an overnight student leadership camp that was designed and executed by Project Flame's student leaders together with one of our staff members. The first such camp served 20 pupils, the next, however, will be combining 60 pupils from three schools and will provide many opportunities for our students to gain valuable service learning experiences.

Perhaps the most significant highlight of our Service Leadership activities has been the partnering with the Junior Chamber International (JCI) to arrange three O! Love Tours in 2014, 2015 and 2016. Each tour matched twenty CityU students with twenty poor single elderly persons in Hong Kong to visit Taipei for a holiday. The students learn about communicating with and supporting the elderly and the tours provide excellent opportunities for them, not only to enrich their service learning and leadership experiences, but also to really understand the fundamental SLAM belief that the 'server is the service'. Both the elderly and student participants have found the tours to be truly life enriching experiences, and the O! Love Tour won the Best Social Service Project and also the Best of the Best of the 2015 JCI Outstanding Projects Awards.

Social Innovation Incubation

The ability to innovate is a very important leadership attribute. Our endeavors in innovation incubation have exposed students and faculty to key ideas and practices in social innovation and entrepreneurship. Activities have included: taking part in the Diamond Sedan Competition (winning third place), co-sponsoring the Social Enterprise Summit, and holding a 'Photo with a Message' Competition. We held a Mini-MaD (Make a Difference) Workshop on Zero Food Waste for 80 students in 2013-2014, with students working on implementable proposals to solve the chosen problem.

Our student volunteers operate 'Hand2Spot', which is our innovative campus second-hand shop, the first of its kind in Hong Kong. The students receive intensive training to run and lead the service and to innovate new marketing and service delivery strategies. For example, in 2015 student leaders initiated a book auction in addition to the more routine on-line and counter sales. Many of Hand2Spot student leaders have engaged also in activities such as our three Green Fashion Shows in which student models, with the support of a local fashion coordinator, make-up artists and sound engineers, wear donated second-hand clothing to highlight the needs for environmental consciousness and a new culture of re-use. In addition to the above activities, students taking the GE course, *Make a Difference: The Challenge of Social Entrepreneurship in a Globalized World*, work together in teams to identify social or environmental problems of their own choice. They then develop ideas to tackle their chosen problem. The students' innovations are required to be implementable and two projects have won particular praise. The first, "Transfriendly", developed a walking stick that can vibrate and help the elderly to navigate their way onto incoming buses. This won the

My Own Discovery Award 2014 in CityU. The second is called “Sonus” and entails a device that translates finger motion into speech. This won the Project Flame Social Innovation Award 2014 and has since been submitted for a patent application by CityU’s Knowledge Transfer Office.

In 2013 and 2014 we organized two international symposia that included pitching competitions with prizes to encourage young people to imagine, develop or implement their own social innovations and enterprises. Leading social entrepreneurs from the UK, Australia, Indonesia, USA, Malaysia, China, Taiwan and Hong Kong provided insights into how they identified the particular problems they wished to address. They then discussed the challenges, successes and failures encountered as they started or scaled up their enterprises. The speakers not only provided role models for exemplary service leadership and successful entrepreneurship, but also provided master classes for participants that included giving free advice to those starting or seeking to scale up their own social enterprises.

Research and Knowledge Transfer

Initial knowledge transfer activities included the Social Entrepreneur in Residence Program, a Community Forum on Social Innovation, a Workshop on Medicine Management Systems in Institutional Settings, and a visit to Social Innovation Parks in the cities of Shunde and Zhongshan that resulted in a student internship for eight students in Shunde in June 2013.

The above mentioned International Symposia in Discovery, Idea Incubation and Scalable Social Impact were co-organized with serial social entrepreneur and author Michael Norton OBE, the co-founder of UnLtd in the UK, India and South Africa, and also the co-founder of the International Centre for Social Franchising. By bringing together an impressive array of prize-winning international social innovators and service leaders to share their experiences and lessons with our students, staff and community participants, these symposia provided focused opportunities for knowledge transfer which, together with research, forms a key part of the core mission of the university. The social enterprises founded or managed by the speakers—for example Spark Inside, Buffed, Alternative Indigenous Development Foundation (AIDFI), Bike Works, Senior Citizens Home Safety Association, 18 Chefs, Diamond cab, Green Monday and many others, have all proved successful at providing new services or fresh opportunities for the socially disadvantaged – such as for the elderly, ex-offenders, ethnic minorities, rural poor, children and, together, have already served hundreds of thousands of people. Notably, all of these organizations possess mission statements in which the values of service and leadership are stated very clearly and thus provided excellent exemplars for our students.

In November 2013, Project Flame began a key applied research activity when it was awarded a contract by the Hong Kong General Chamber of Social Enterprises (HKGCSE) to develop a Social Enterprise Endorsement System for Hong Kong, which has now been known as the Social Enterprise Endorsement Mark (SEE Mark). The project was co-funded by Standard Chartered 150th Anniversary Community Foundation and by City University. Project Flame was responsible for developing the certification tool and for refining it through pilot-testing with 30 social enterprises to match the needs of the local social enterprise ecology. The SEE Mark is not only creating wide community impact and is also helping to enhance many aspects of service leadership in action. The scheme has been designed

specifically to cater for all social enterprises at different stages of development ranging from incubation through to advanced level. For every category, a particular emphasis is given to capacity building and to steps for enhancing both service and governance. One side benefit of the research has been the building up of new knowledge about social enterprise leadership and service - much of which is now being used in our classes with students. Another applied research activity is a new annual impact evaluation undertaken for the HUB Hong Kong, a local NGO that serves the poorest children and families in Sham Shui Po. The project engages students to help conduct interviews with children, their family members as well as with staff and volunteers in the HUB. This again enables the students to gain fresh insights into the nature of service and service leadership.

IMPACTS

We have no doubt that Project Flame has been successful in bringing forth positive impacts on its participants. In particular we emphasize: –

Proactive Engagement

Our programs, courses, internships, knowledge transfer and research activities provide excellent opportunities for both students and staff to reflect upon the many ways in which service leadership embraces the challenges of satisfying others' and one's own needs ethically, effectively and with prosocial values. Our initiatives in service leadership and social entrepreneurship have gone well beyond our pioneering classroom teaching and learning. In particular, we have sought to enhance students' learning and character development through a wide range of intra- and extra-curricular related activities such as inspirational guest talks, field trips, study tours, international internships and more. Such activities create positive impacts for students and for those they serve. They also reaffirm our belief in importance of adding value through proactive engagement between the university, students and members of the local and international communities.

Personal Growth

Student projects have shown excellent promise in social innovation and service design. A few projects have won prizes and have potential for patent development and production. The students participating in Project Flame activities have received highly complementary feedback from outside organizations. For example, several employers of students in the summer service leadership internships in Zhongshan, Shanghai and Singapore have stated their willingness to employ the interns once they are graduated. Feedback from the schools served by Project Flame's students under Project WeCan has also been very positive with our being asked to serve an additional school as a result. Students' own feedback and reflections on their learning continuously stress how their participation in our activities has added considerably to their personal growth and social awareness, with many students reporting that it has enhanced their commitment to serving the community in their later lives.

FUTURE DIRECTION

Our road down the service leadership and social entrepreneurship journey has been a rich and exciting experience. With the generous support from the Victor and William Fung Foundation we have built up an excellent foundation for Project Flame and our Service Leadership Initiative. We are now entering a new phase. New courses have been introduced including *Changing Our Society; Turning Social Problems into Services/Business Opportunities; Critical and Cultural Issues in Hong Kong's Service Economy; Writing Apps for Social Innovation; and Social Innovation and Entrepreneurial Venture Exploration*. Our study tours and internships are continuing with our most recent activities in 2016 being held in Shanghai and Taipei.

With the ending of the Li and Fung funding, we are taking steps both to enlarge collaboration and to create synergy between Project Flame and other units or organizations within or outside the university. Such bodies include, for example, CityU's Innovation Commons (IC) and the Hong Kong Jockey Club CarbonCare InnoLab (COIL), with whom we are organizing sustainability events. Study tours, internships, knowledge transfer workshops, applied research with local social enterprises and our service with Project WeCan are continuing, thus further enhancing the opportunities for students to develop their values, character and service leadership knowledge and skills.

In conclusion, through Project Flame's four broad programme areas, CityU has been able to enrich not only the learning experiences of its students, but also our service to the university and the wider community as well.

ACKNOWLEDGMENTS

The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

Chapter 109

SERVICE LEADERSHIP AT HONG KONG BAPTIST UNIVERSITY: A NEW CONCEPT IN GENERAL EDUCATION

A. Reza Hoshmand*, PhD

General Education Office, Hong Kong Baptist University,
Hong Kong, PR China

ABSTRACT

Amid the substantial increase in the role that the service sector plays in the economy of many countries, it is imperative to prepare graduates to provide service with care, and the ethical behavior that is a critical component of service. Institutions of higher learning have been instrumental in developing curriculum that is responsive to societal needs. In the case of service leadership, the Hong Kong Institute of Service Leadership and Management suggested that the Hong Kong tertiary institutions consider developing curriculum that will be responsive to the needs of the service industry and at the same time enhance leadership capabilities of the student-learners. In response to this suggestion, Hong Kong Baptist University (HKBU) initiated this project by designing General Education (GE) courses that addressed service leadership in a variety of disciplines and environments. In the last few years, HKBU has developed ten courses as part of the requirements in its General Education programme. Assessment of the effectiveness of the offerings shows that the students are valuing their exposure to the philosophy of service leadership, and have developed the valued characteristics of effective leaders, including empathy, openness in mind, being creative, socially responsible and reflective citizens.

INTRODUCTION

* Corresponding Author's Email: hoshmand@hkbu.edu.hk.

Institutions of higher learning have been instrumental in developing curriculum that is responsive to societal needs. In the case of service leadership, the Hong Kong Institute of Service Leadership and Management started the Li and Fung Service Leadership Initiative, which suggested that the Hong Kong tertiary institutions consider the possibility of developing curriculum that will be responsive to the needs of the service industry and at the same time enhance leadership capabilities of the student-learners.

With the financial support from the Victor and William Fung Foundation, Hong Kong Baptist University initiated this project by incorporating service leadership courses in its General Education (GE) offerings. This meant giving the faculty from the different disciplines a chance to design and develop interdisciplinary courses that addressed service leadership in a variety of environments. GE provides a perfect platform for this type of curriculum as it exposes a large number of students to the concept of service leadership, and encourages integration of knowledge across the curriculum.

The aim of GE is to instill in students the ability to develop a broad knowledge, and intellectual skills necessary for lifelong learning as stated by Cuevas, Matveev, and Miller [1]. Specifically, our graduates today enter the world of work facing many complexities that are part of the realities of today. To be prepared to deal with these complexities, students need to be able to integrate knowledge from different disciplines. Xing and Ng [2] regarded professional competence, critical thinking, effective communication, innovative problem solving, and ethical leadership among the given and desired key attributes for the GE curriculum. GE hence becomes the bridge between the discipline specific majors and the values that university education espouses. One of those values is the ethical leadership that must go hand and hand with the increasing emphasis in providing services.

Figure 1. Service sector’s value added to the GDP of economies.

With increasing emphasis throughout the world on services and the contribution of the service sector to the GDP of economies as shown in Figure 1, it is imperative that the future graduates become familiar with the elements of services and the leadership needed to continue its growth path.

Aside from the significant contribution of the service sector to the GDP of countries, the most crucial aspect of the service sector's ascendance is thorough integration of services with virtually every other aspect of the present-day world economy. Service sector has become a critical source of new local jobs, as well as an essential ingredient in creating a commercial

environment conducive to entrepreneurship, and a vital link to the wider world economies. On a global scale, the service sector is growing rapidly. It does not matter whether it is Hong Kong or New York, the employment generated by the service sector as compared with the manufacturing sector is unprecedented. According to Economy Watch [3] as of 2008, 87.7% of the workforce in Hong Kong is employed by the service sector. Similarly, if we were to look at the employment generated by the service sector in the U.S. between 1965 and 2013 [4], we observe an increasing growth over the decades as shown in Figure 2.

Source: Bureau of Labor Statistics, Employment, Hours, and Earnings from Current Employment Statistics survey (National), <http://data.bls.gov/cgi-bin/surveymost?ce> (Accessed on 03/03/2016).

Figure 2. Employment contribution of the service and manufacturing sectors.

According to Hong Kong Monetary Authority [5], stronger growth in employment relative to the labour force has driven down the unemployment rate from the peak of 8.5% in mid-2003 to a nine-year low of 4.2% in the second quarter of 2007. Distribution of employment by economic sector shows that growing labour demand in the service sector has been the key driver of employment growth over the past few years as shown in Figure 3.

Source: Hong Kong Monetary Authority Quarterly Bulletin, September 2007.

Figure 3. Employment by economic sector.

In view of such contributions to the welfare of an economy, it is essential for the graduates of institutions of higher learning to become familiar with the concept of service leadership and what role they can play in maintaining high quality service in their chosen disciplines.

Service-driven leadership begins with a fundamental shift in attitudes and actions. How to develop a curriculum that addresses a shift in attitude and action was an important element to be addressed. Our courses attempted to bring theory and practice to surface. We aimed at creating a number of courses so as to provide greater opportunities for the students to be exposed to the concept of service leadership. Besides the curriculum, we offered various kinds of co-curricular activities outside of the classroom, so that students can learn how to be good service leaders.

The ultimate goal of developing Service Leadership Education (SLE) courses at HKBU under the GE curriculum is to allow our students to experience service leadership in their university study and to cultivate in them the leadership capabilities for providing excellent services with care. The GE Programme is an ideal platform to initiate the SLE project because while students are broadening the scope of knowledge as foundation by taking courses from a wide variety of disciplines, they can also experience leadership through dynamic interactions with peers who are studying in different majors.

Course Development and Delivery

A total of ten SLE GE courses (see Table 1) were developed and over 400 students were enrolled in the courses offered in the past years. These GE courses incorporating the ideals of service leadership were purposely designed and delivered to build leadership competencies in our students. Ethical practices and the importance of positive social relationships are deeply emphasized in those SLE courses to equip students to be good service leaders. It is hoped that they can develop the valued characteristics of effective leaders, including empathy, openness in mind, being creative, socially responsible and reflective. All of the SLE courses developed aim at engaging the students in various kinds of teaching and learning activities, so that they can understand how service leadership is influenced by social perceptions.

In these holistic and interdisciplinary SLE courses, we have incorporated content and pedagogical strategies that help students to improve their ability to recognize the importance of trust and respect in social contexts, and how to deliver service with competence, and care. We believe that theories, research, and practices from a wide variety of academic disciplines and a wide range of scholar-practitioner experiences inform, support, and enhance service leadership curriculum and extra-curricular activities. We have achieved this goal in our courses which were well received by the students. The features of our SLE courses are shown in Figure 4 and the details of our SLE courses as well as the related publications can be viewed at <http://ge.hkbu.edu.hk/ge-programme/sle/>.

The approach taken by HKBU in offering GE courses with service leadership elements to our students is distinctive. From a programmatic perspective, we looked at two salient means through which our university could support service leadership: (a) curricular, and (b) extracurricular. Much of the work currently done in most universities relate to the extracurricular activities such as service learning. Our emphasis has been on the curricular

approaches to engage students in the community. We view service leadership as an integral part of a course that emphasizes the role of leadership in providing services to the community at large. Educational experiences in which students participate in an organized service activity that meets identified community needs (whether it is a business or a social organization) and reflect on the service activity in such a way as to gain further understanding of the course content, a broader appreciation of the discipline, and an enhanced sense of civic responsibility have been the hallmark of these courses.

Table 1. Courses

No.	Course title	Areas covered	Offering departments/offices
1	Leadership in Sustainability	Business, Science	Department of Management
2	Service Leadership in Action (Health Services)	Chinese Medicine, Social Sciences	School of Chinese Medicine & Department of Social Work
3	Service Leadership and Emotional Intelligence	Arts, Social Sciences	Department of Social Work & Office of Student Affairs
4	Paths to Service Leadership in Health Services	Arts, Chinese Medicine	Department of Religion and Philosophy & School of Chinese Medicine
5	Language and Service Leadership	Arts, Social Sciences	Department of English Language and Literature
6	From Responsible Citizenship to Service Leadership	Arts, Social Sciences	Department of Religion and Philosophy
7	Service Leadership and Meaning of Life and Death	Arts, Social Sciences	Department of Religion and Philosophy
8	Sharing Values: Interreligious Dialogue on Real Issues in the Real World	Arts, Social Sciences	Department of Religion and Philosophy
9	Service leadership in Learning Communities	Arts, Social Sciences	Department of Education
10	Service Leadership Practicum	Business, Social Sciences	Department of Marketing

Figure 4. Features of SLE courses at HKBU.

Developing service leadership at the institutional level required us to pay special attention to the following elements: awareness, planning, support, expansion, and evaluation. Research conducted at 44 institutions in the United States (US) that participated in a three-year study of integrating service with academic studies identified four constituencies that a service learning/leadership programme should focus its attention: institution, faculty, student, and community.

In the last three years, we have effectively engaged all parties in constructing courses that will have a significant impact on the lives of our graduates for years to come. The lessons learned from this project have been numerous. The success of the project needs proper planning, providing workshops to faculty, and supporting the extra-curricular activities that were a part of these courses. Assessment of the SLE courses all point to the positive impact these courses have on the lives of our students.

Faculty Activities on SLE

For faculty, we organized workshops on the design of SLE courses. Participating colleagues had an opportunity to discuss with their co-workers and identify potential partners for designing and delivering new courses. In addition, they had a chance to explore how they could facilitate student learning effectively inside and outside of the classroom in the SLE courses. Also, guest speakers from different backgrounds were invited to conduct seminars on the topic. Dr. Lu Yu, Assistant Professor in the Department of Applied Social Sciences, The Hong Kong Polytechnic University, was invited to deliver a seminar on “Character Strengths in Chinese Culture: Confucian Virtues and Service Leadership” in October 2013. Seminar on “General Education, Service Leadership and Management” was conducted in October 2014 by Mr. Po Chung, who shared his latest thoughts on the philosophy of service leadership and how GE makes an impact on the management in the real business world.

As a way to encourage more open dialogues on the teaching and learning in GE courses, we organized a retreat at the end of each semester. Colleagues teaching SLE courses were invited to share their experience and good teaching practices with other faculty. Through different kinds of training and workshops, faculty can become more effective facilitators in student learning. Successful strategies are also identified to develop sustainable service leadership curricula and activities at the university.

Student Co-Curricular and Extra-Curricular Activities on SLE

In addition to the SLE curriculum, various kinds of co-curricular activities were organized for the students so that they can learn how to be a good service leader outside the classroom. We provided abundant opportunities for the students to broaden their horizons on the concept of service leadership. We initiated the “Be eager to learn, to care, to lead” series in relation to the SLE project, which aims at providing opportunities for students to experience and learn how to be a leader in serving the people in need. The activities we organized over the years are shown in Table 2.

Table 2. Events

Date	Event
May 2016	Outing to New Life Social Enterprise
March 2016	Oxfam x Eldpathy Sociology Game on HK Elderly Poverty
January 2016	Theatre in the Dark: "The Choice of Hamlet"
November 2015	Guest talk on Service Holiday Co-organized with Department of Management, School of Business
October 2015	"Be eager to learn, to care, to lead" Series: GE x DiD Night (co-organized with Dialogue in the Dark for the 2 nd time)
October 2015 – March 2016	Youth Ambassadors for Social Inclusion Co-organized with Dialogue in the Dark
March 2015	"Be eager to learn, to care, to lead" Series: Breaking the Boundary! - Dialogue with Ricky Wong cum GE Outstanding Students Award Ceremony
February 2015	"Be eager to learn, to care, to lead" Series: GE x DiD Night (co-organized with Dialogue in the Dark)
November 2014	"Be eager to learn, to care, to lead" Series: Extraordinary 2 hours (Co-organized with i-dArt)
November 2014	Seminar on Service Leadership: Going Green in the Office Dr. William Yu, CEO of World Green Organization

We promoted the concept of Service Leadership among students through different channels and initiatives, such as cooperating with other offices or units to organize various kinds of activities for our students. The GE Office cooperated with the Office of Student Affairs to organize a global summit on "Explore the Unexplored" on 28 and 29 March 2015. Nearly 100 local and international students joined the event to discuss a couple of global and local issues. Through the implementation of the concept of "Act locally, Think globally," participants' awareness of global issues and understanding of what global citizenship means were enhanced.

Last year, the GE Office sponsored the Public Speaking Contest of the School of Business by giving a prize to the winner who delivered a speech on service leadership. Our office also sponsored a student to participate in the Change-Makers Programme of the Office of Student Affairs in which she conducted research on the theme of "Hunger and Poverty" in an 8-day service trip to Nepal. Through the above activities, we hope that students can be equipped with the qualities and capabilities of being good leaders while delivering excellent services.

Assessment of SLE Courses

To evaluate student learning in the SLE courses, we conducted focus groups to collect feedback from students who took those courses. Generally, they had very positive feedback on the course especially on the special teaching and learning methods used to stimulate their reflections on being service leaders. It is found that students who took our SLE courses show good indication on ways to improve their leadership capabilities and they have got more extensive understanding of different leadership models. Some of them reflected that they are now more caring and sensitive to others' needs. They understand deeper the essence of delivering excellent services to people as well.

For SLE co-curricular activities, post-event survey was distributed after each event and the average score of satisfaction of overall experience was over 8 out of 10. It shows that the SLE courses and activities gave students new perspectives on leadership and they are provided with the opportunities to apply what they have learnt in class to real situations.

CONCLUSION

The SLE project at HKBU is successful and is regarded as a significant step to further enrich the curriculum of HKBU's GE Programme. The SLE courses and co-curricular activities offered multiple opportunities and varied experiences for students to develop skills in service leadership. At the individual level, students can learn about their strengths and weaknesses as leaders and followers, experiencing leadership through action and reflections. At the community level, students are more willing to contribute their talents and knowledge through providing services to the people in need and bring positive impact to the community. They are better prepared to be more effective leaders in their career and in community life after graduation.

As for our future plans, HKBU will continue to develop courses on SLE under the GE Programme. We shall encourage more interdisciplinary collaboration between faculty members from different departments and across disciplines. Besides the co-curricular activities inside and outside of campus, we shall try to explore internships locally and overseas as a way of developing the competencies needed to be good service leaders. Overall speaking, the Li & Fung Service Leadership Initiative has added new and important elements of service leadership to our GE Programme that supports the ethos of "Whole Person Education" of HKBU.

ACKNOWLEDGMENTS

The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

Chapter 110

EDUCATING STUDENTS AS THE LEADERS OF THEIR LIVES

Kin-Man Chan^{1,*}, PhD and Hugh Thomas², PhD

¹Department of Sociology and

²Department of Finance,

The Chinese University of Hong Kong, Hong Kong, PR China

ABSTRACT

The Service Leadership Initiative (SLI) at the Chinese University of Hong Kong involved 1) a general education course “Service Leadership in an Uncertain Era,” 2) producing video assisted cases, 3) delivering modules on service learning through CUHK’s I-CARE program, and 4) a social website for the service leadership and learning community. The course was only a modest success, owing to the intense competition for students from many offerings in the Self and Humanity area and the course’s academic rigor. The video assisted cases showed far greater promise in the flipped classroom and discipline specific young service professional leaders than in the traditional long form case, even when videos augment cases. The service learning in Chinese and Taiwan NGOs increased mindfulness, soul-searching and communication skills. The social website had good initial frequency of usage but its social dimension has been lacking, suggesting a need for far greater focus in user groups.

INTRODUCTION

The Service Leadership Initiative (SLI) provided The Chinese University of Hong Kong (CUHK) in general and the writers in particular an opportunity to deepen and develop applied theory, teaching and student service learning. In line with the SLI’s philosophy [1], we encourage students to see themselves as leaders in their own lives and understand leadership as a process – how to engage stakeholders to make progress by facing “adaptive problems”

* Corresponding Author’s Email: kmchan@cuhk.edu.hk.

together [2]. Competence in terms of educating the followers, providing stakeholders sufficient information, and skills in deliberation is important, but character and caring attitude are more fundamental in creating trust during this process. In view of this, we worked with leaders in companies and the community to provide students opportunities not only in practicing leadership skills, but also in building their characters and caring attitude. This chapter will discuss our achievements, impacts, and lessons learned. To understand SLI's impact, one must appreciate the CUHK background to SLI related activities: the context provides a lens through which to assess our successes or failures. SLI at CUHK involved

- [1] a general education course "Service Leadership in an Uncertain Era"
- [2] producing video assisted cases
- [3] delivering modules on service learning through CUHK's I-CARE
- [4] a social website for the service leadership and learning community.

For all but [4], CUHK has solid precedents in courses, programs and faculty and staff activities. We will discuss each of the four activities, SLI's impact and, drawing on lessons learned, how we can continue our student development of service leadership.

THE GENERAL EDUCATION COURSE: UGED 1250 SERVICE LEADERSHIP IN AN UNCERTAIN ERA

The Memorandum of Understanding stated that the main purpose of SLI was "...promoting a new model of leadership, service, and service leadership for the post-industrial age capable of being taught in universities" At CUHK we joined that promotion by developing and offering a general education (GE) elective course *UGED 1250 Service Leadership in an Uncertain Era*.

CUHK GE courses are offered by the GE Office, departments and colleges, of which CUHK has nine. CUHK's colleges, Chung Chi, New Asia, United, Shaw, Morningside, S.H. Ho, C.W. Chu, Wu Yee Sun and Lee Woo Sing College, are primarily responsible for student housing, extra-curricular life and pastoral care. The only for credit courses they offer are GE courses. Colleges have considerable discretion concerning the structure, content and rigor of their GE course. The GE Office offers a very few cross-disciplinary, rigorous courses. The GE Office's greatest task is teaching to the entire student body the required courses *UGFH 1000 In Dialogue with Humanity* and *UGFN 1000 In Dialogue with Nature*. With 363 GE courses already on the books at CUHK, the GE Office does not wish to offer new university-wide GE courses. They leave the task of launching new GE courses to departments and colleges.

We applied to the GE Office to launch UGED 1250, even though it required a lengthy application and vetting process, so that UGED1250 would meet the academic standards of the university, would not be restricted to only a single college, and would be perceived as a truly cross-disciplinary offering. We discuss elsewhere our GE course structure, and how it draws on sociological, business, political, and psychological classics works in leadership, uses case studies and brings in prominent business, third sector and political leaders [3]. Here we only summarize, report on impact and suggest lessons for future action to promote the SLI.

UGED1250 is team-taught by the authors, with several guest lecturers. The course is composed of five parts: 1) Theories of leadership; 2) Leadership in business; 3) Leadership in politics; 4) Leadership in non-profits; 5) Cross-sectorial leadership. Students are required to participate in group discussion in class, write reflection notes, and analyze a leader in a term paper. In the course offered in 2015-16, students are also required to work on a service design group project. In terms of quality, the course has been a success, at least judging from the excellent scores received from course evaluations. However, in terms of student enrollment, it has not been very impressive, drawing a total of 44 students in the three classes offered from 2013 to 2016. What lessons do we draw?

To answer this question, one needs to understand the competition among courses for student registration. All students at CUHK must take 21 credits (i.e., seven standard 3-credit courses) of GE. Six credits are taken up by *In Dialogue with Humanity* and *In Dialogue with Nature*. Each student must take at least three credits at his or her college, leaving 12 credits, which must be distributed among the four areas of GE as follows

- A. China Cultural Heritage
- B. Nature, Science and Technology
- C. Society and Culture and
- D. Self and Humanity

As one can see from the UGED1250 code, *Service Leadership in an Uncertain Era* is in *Area D: Self and Humanity*. Within *Area D: Self and Humanity*, 70 different courses (some with multiple sections) compete for students. Students may choose from *Area D* courses offered by departments, by colleges and by the GE Office, with UGED1250 being the only UGED course offered by the GE Office. In general, students perceive GE Office courses as more rigorous than department GE courses which are more rigorous than college GE courses. We require two written assignments and we actively mark class participation, so students perceive UGED1250 to have a moderately heavy workload. Students tend to prefer Cantonese but we give a substantial percent of the class in English. The grade a student receives does not reflect the rigor of the class – all classes are subject to the same proportions of As, A-s, B+s etc. So students rationally may choose a “softer” class than UGED1250 to fulfil their *Area D* requirement.

Furthermore, within *Area D*, UGED1250 is not the only course in the service leadership space. Not including UGED1250, nine UGED courses involve service learning or service to society and three involve leadership (inferred from course titles). These 12 courses do not include the GE College Senior Seminar offered by most colleges, which typically involve service learning projects and leadership issues.

Many students are hesitant to take our course because it appears to be very theoretical and demanding in terms of multiple assessments. A better promotion may help students understand the importance of learning service leadership in a service economy like Hong Kong. But it is more fundamental to restructure the course by reducing the amount of theories and adding elements of experiential learning such as practice in mindfulness.

Considerable promise exists for converting UGED1250 and other SLI content course offerings throughout Hong Kong into flipped classrooms [4]. The flipped classroom substitutes videos to be viewed at home by students for lectures and uses instructor-student contact hours that used to be occupied with lectures for discussions and other student-

centered learning. Promoting GE course with fully public video materials can make clear the content of the class to students before they enter the classroom. And a flipped classroom can present an attractive format whereby students use class time to explore service leadership in the context of human society's rich leadership tradition. But since requiring students to watch a video before attending each GE class can be seen by students as over-demanding, the advisability of using flipped classrooms should be carefully considered.

Since there is no hope for the course to become a required course in GE, we will have to face the keen competition from other GE courses in the year to come. The CUHK Department of Sociology is now considering hosting this course so that a stronger social dimension of leadership can be introduced. Their track records in providing quality GE course may also help branding the course. In order to spread more effectively the message of SLI, we believe that we need to go beyond the existing structure by developing SLI flipped classroom materials and introducing SLI teaching materials and modules into existing courses. This is an avenue we wish to pursue.

PRODUCING VIDEO ASSISTED CASES

CUHK's SLI team developed teaching materials and modules and produced video assisted cases. We discuss the effectiveness and challenges of the case method, our approach to supplementing traditional cases with YouTube videos of the protagonists, our methodology in developing case sets and our results up to May 2014 in our conference paper [5]. In this section, we report on progress since 2014 and the potential for further development.

To date, we have completed nine traditional Service Leadership Initiative cases with videos and are in the process of completing an additional three for a total of 12. We intend to continue producing cases at this rate for at least another year. In addition, we broadened the scope of video case development. We have completed 14 click-through videos that describe the service leadership of young Hong Kong financial professionals [6] and have completed 30 videos in a flipped classroom for introductory corporate finance. These two additional initiatives together have received up to 500 views per week (including views through CUHK's and CUHK Shenzhen's Moodle platforms). And we believe that they offer considerable promise, broadening service leadership pedagogy to specific industries, one discipline at a time.

In our work, we continue to face two major challenges: inability to motivate effectively professors to coauthor SLI cases and failure to promote completed cases effectively. The two problems are interconnected. Even though the interaction between academics and practicing leaders is absolutely critical to developing sound service leadership theory and practical knowledge, very few academics are willing to devote enough time to interact and subsequently develop usable teaching case materials. At CUHK, we relied on working with less than 10 instructors with a history of case development. No SLI colleague from outside of CUHK approached us about jointly developing cases, although we frequently requested the Action Research Team (ART) and approached several individual members directly.

The unique viewer numbers of the six videos developed for traditional teaching case use that have been on public YouTube display for over one year range from 108 to 398 per video. These low numbers lead us to believe that no class outside CUHK has directly used any of the

videos. The reason, we believe, is two-fold: 1) the SLI curricula developed by other ART members relies largely on non-business leaders, rendering our materials not useful, and 2) there is a preference for using materials that each instructor has already developed, or using globally prestigious materials rather than using materials from competitor schools within Hong Kong. We offer no solution to this reluctant uptake on traditional case development and use. We remain hopeful, however that we can contribute to critical mass development in the Hong Kong and Greater China. Commitment to build the service leadership community will result, in the long run, in world recognition.

DELIVERING MODULES ON SERVICE LEARNING THROUGH CUHK'S I-CARE

Soon after Professor Joseph J.Y. Sung became vice chancellor and president of CUHK, he launched in 2012, the I-CARE Framework for whole-person development of students:

- I: Integrity and Moral Development
- C: Creativity and Intellectual Development
- A: Appreciation of Life and Aesthetic Development
- R: Relationships and Social Development
- E: Energy and Wellness [7]

The student development goals of I-CARE are fully compatible with SLI. I-CARE uses civic engagement programs – service learning, social research projects, social enterprises and corporate social responsibility – to achieve this development.

We used SLI resources to support the I-Care NGO Internship Program. The program is highly popular with many more student applicants than allocated spots, so every year we select a small number of students from a large applicant pool. The program aims to develop students' sensitivity, resilience and leadership through serving in communities that challenge their adaptive power. Around 40 students are selected every year to serve in NGOs and social enterprises for eight weeks in Mainland China and Taiwan. The NGOs are mainly located in rural areas and they address poverty alleviation, environmental protection, cultural heritage preservation, and other social issues. SLI support for I-CARE was centered on pre-service training sessions on civil society, mindfulness and communication skills, and on post-service experience sharing and reflections. Students appreciated their exposures to very different social and economic conditions from Hong Kong: this culture shock enhanced mindfulness and promoted soul-searching.

Drawbacks of the program included the limited number of students enrolled and constraints not only from financial resources but also the limited number of qualified mentors. CUHK remains committed to continue the program, with funding permitting.

A SOCIAL WEBSITE FOR THE SERVICE LEADERSHIP AND LEARNING COMMUNITY

Since the launch of SLI, sponsors have voiced the need for an SLI internet presence and various ART members have suggested a need for a social SLI platform. In 2014 ART meetings, discussions of the difficulties of creating an academic journal for SLI research turned towards creating a research platform for placing of pre-submission papers as a first step. In the September 2014 ART meeting, we proposed to set up a digital platform. ART members warmly supported our proposal. Based on interviews with the teams of each ART member, we designed the platform.

The design was simple. Posting members would specify the title, identifying tags, whether the files may be downloadable with the click of an icon, whether the posting allows forum discussion, whether the posting member's email is given for contacting and the duration of the post. Each post would display the title, author, date and tags and (if appropriate) summary, download icon and email contact. Copyright of and control over posts would belong to posting member. The post could be edited or pulled off the platform by the posting member at any time. The administrator could also pull a post deemed insulting, obscene, infringing intellectual property or highly antagonistic to the philosophy of the platform. Only members could discuss posts by posting to a forum. The ultimate goal of the platform was to operate as a social media community centered on ART.

On August 1st 2015, after six months of development, the Fung Service Leadership Initiative Platform www.service-leadership.hk went public. After launch, we actively solicited postings from three groups over the next month:

- 1) Former UGED1251 students
- 2) Former student participants in the CUHK Vice Chancellor's Cup of Student Entrepreneurship and the Hong Kong Social Enterprise Challenge
- 3) Members of ART

From launch to October 6, 2015, there were 65 postings as follows: instructors: 32, students: 31, researchers: 1; community partners; 1. The website has attracted approximately 80 site visits per week since from late September 2015 to January 2016. Those who visited the website spent an average of just over six minutes there. So on the face of it, the website has enjoyed a modest success.

However, our attempt to build a *social* website has failed so far. *Social* websites have social interactions. Ours does not. We have solicited or made the posts ourselves. Not a single non-CUHK member of SLI has made a single posting to the platform. With the exception of one CUHK SLI team member, nobody has commented on anyone else's post although many have read them. Non-members can see most of what is on the site without going through the bother of signing up for membership. To the extent that some posts are for members only (this is within the power of the posting member to decide), non-members do not know what, if anything, they are missing.

We have attracted 54 members, but we personally invited all 54. We conclude that membership is not attractive. It confers the rights to post, to comment and to invite new members, but we have not developed a community that wishes to post, comment or invite

new members. To our knowledge, nobody has applied, unsolicited, for membership, even though such application is automatically accepted if it comes from one of the 20 some emails that had the suffix of a Hong Kong institute of higher learning. Our impact, during the first two months of the “social” website is disappointing.

A social website’s success is based on the 3 Cs: community, content and commerce [8]. What lessons can we draw from the preliminary usage of the site concerning our community, the content and the potential for commerce (i.e., high usage)? First, SLI itself is not a community with sufficient definition to give any of the corners of our website a critical mass. Asking ART members what they want, as we did in late 2014, was not enough. ART members’ responses suggested that SLI had four distinct communities leading us to design the four corners: a researchers’ corner for pre-publications drafts of service leadership research, a community partners’ corner for NGOs and companies in service learning, an instructors’ corner for the exchange of relevant teaching materials and a students’ corner for our primary community – the students whom we wish to instruct. However, each of those potential communities is very diverse and has a wealth of platforms to choose from. The question, “why should I post to www.service-leadership.hk?” does not even occur to members of these communities, unless they were asked to post by members of our team. So far, each has posted only as a favor to us.

There is some good news. Two constituencies offer glimmers of hope for the platform. First, in the instructors’ corner, we have used posting as a convenient way of sharing videos with students in the Mainland. The platform is not blocked by the Great Firewall. Over half of the platform’s usage comes from the Mainland. Hong Kong social enterprise startup planners form the second promising community. Twenty-two of the 31 student posts on the platform are business plans posted by or on behalf of former competitors in the Hong Kong Social Venture Challenge [9]. This Hong Kong-wide competition has been run annually by the CUHK Center for Entrepreneurship, since 2007. The organizers of the competition support our approach in two ways. They have asked past years’ teams to post their plans and they are asking the current year’s teams to read the posted plans to make their own plans better. From this interaction, we have discussed plans to build a targeted Hong Kong community that wishes to interact about social ventures. We anticipate that there may emerge a social element in the website. Following that, we will discuss with the HKSEC director about steps for tailoring the platform to meet their needs better.

We believe that the principle of an SLI platform remains good, notwithstanding the problems discussed above. If however, the digital needs of SLI can be satisfied by existing platforms, we must ask the question, “why develop our own?” Our students in Hong Kong and the Mainland have indicated that they are happy using, respectively, YouTube and Youku as video platforms and WhatsApp and WeChat for mobile social interaction. What advantage exists in building rather than using existing platforms? The answers lie in greatly sharpening focus onto specific communities whose needs can be met by our resources more efficiently.

CONCLUSION

SLI has provided CUHK in general and us in particular with a unique opportunity to teach our students about service leadership. The general education course on service

leadership is seen by students as a high quality course but one that is too rigorous in its student assessments. Without taking the course, students cannot differentiate the idea of service leadership from serve learning and are unable to appreciate the value of service leadership versus leadership in general. Further promotion of the importance of specific attributes of leadership in the service economy should be helpful in boosting enrollment. The flipped classroom as a new mode of teaching should also be explored. The production of video assisted cases provides researchers and teachers tools to study and disseminate knowledge of service leadership in the local context. Since each case is produced to illuminate specific academic themes, it is important to collaborate with scholars in diverse fields that interact with service leadership. Unfortunately, the number of scholars paying attention to service leadership (let alone studying it) is scanty even in a service economy like Hong Kong. The NGO internship has been remarkably successful as students can reflect on the meaning of service and leadership through experiential learning. The problems of this program include lacking resources and quality staff who can coach students in their services (in different professions) and help them in the soul-searching process so necessary to develop leadership. The website for service leadership and learning community is in an experimental stage. It could become a useful platform – for example for students in Hong Kong Social Enterprise Challenge – but to do so will require greater focus and promotion of a service leadership community in university education as well as in industry. We sincerely hope that the programs initiated and broadened by SLI will continue to prosper at CUHK and that our modest successes and our failures will provide valuable lessons to instructors, researchers, community partners and students, improving the quality of service leadership in Hong Kong.

Chapter 111

GROOMING SERVICE LEADERS THROUGH DYNAMIC TEACHING

Hugh Thomas^{*}, PhD

Department of Finance, The Chinese University of Hong Kong,
Hong Kong, PR China

ABSTRACT

The Service Leadership Initiative at CUHK involved producing locally sourced, globally applicable, teaching materials usable both in a general education SLI course and in modules concerning service leadership in other courses. This chapter reviews the production of nine video enhanced Harvard-style cases and 30 videos for the flipped classroom and discusses at greater length the 55 videos for the young financial professional videos.

INTRODUCTION

The Service Leadership Initiative (SLI) at CUHK, entitled “*Grooming Service Leaders through Dynamic Teaching*,” involved producing locally sourced, globally applicable, teaching materials usable both in a general education SLI course and in modules concerning service leadership in other courses. Other papers discuss CUHK’s achievements, impacts and lessons within SLI [1] and their use in CUHK’s general education course [2]. In this chapter, we discuss the production of teaching materials with special emphasis on videos concerning the young financial professional (YFP).

* Corresponding Author’s Email: hugh-thomas@cuhk.edu.hk.

VIDEO ASSISTED CASES AND THE FLIPPED CLASSROOM

If, as research indicates, recorded lectures are no worse than live lectures as tools for conveying information to students, one can legitimately question the efficiency of the traditional lecture system of post-secondary education [3]. Students can view, on their own, case-based videos, pre-recorded lectures, and other materials. Consequently, valuable instructor-student contact time can be used for student-centered learning. Video viewing can occur before or after class, before relevant assignments are due and examinations are held, and even after the completion of the course. Digital references can be easily shared among students and, subject to platform accessibility, to the wider learning community. In the flipped classroom, student-lecturer contact hours are devoted to student questions arising from video viewing, interactive discussions, exercises, problem solving, games, presentations, etc. Over the last decade, research has accumulated showing the effectiveness of the flipped classroom [3, 4].

CUHK sought to stimulate dynamic teaching in SLI partly through the production and distribution of video assisted cases of three types: *firstly*, the traditional Harvard-style case with a video, *secondly*, the recording and editing of video-lectures, and *thirdly*, the production of taping of YFP videos. Although this article primarily concerns the YFP videos, we will begin by introducing the traditional Harvard-style cases and video-lectures.

Harvard-style cases have been used to teach business in universities for over a century; that is for as long as business has been taught in the university. They are useful to develop students' discipline-specific skills and conceptual abilities [5] and are effective if student contributions to class analysis are assessed [6]. As I discussed in a precious article, a key part of SLI at CUHK was developing videos to enhance local cases that not only illuminated management theory but do so in the context of service leadership [7]. Each SLI video-enhanced case set consists of a Harvard-style written case, a 10 to 20-page instructor's note and 15 to 25-minute video posted to YouTube. As of the date of this article, we have produced nine written cases sets, have published all of the videos on *YouTube*, have six written cases in publication and another two accepted. Of those in or accepted for publication, seven are or will be cross-sold in *Harvard Business Publishing for Educators Network*. Notwithstanding the challenges we discussed in the earlier article, including the slightly less than even chance that a case begun will be successfully completed, we are currently working on another three cases and intend to continue working on new cases. See Table 1.

The flipped classroom involves two steps, first placing lectures on line and second, conducting a student-centric rather than a lecture-based class. We placed the lectures in two locations, publically on YouTube and privately on CUHK's course-specific Moodle e-learning website. Students were informed of both locations. Table 2 shows the lectures and the number of times they were viewed: in all there were 416 views of YouTube-posted lectures and 11,853 views of the same lectures on Moodle. Clearly, without the incentive of learning in order to gain course credit from passing a specific course, and with no separate promotion of the YouTube site, only a relatively small number of people seek out the flipped lectures that are publicly available.

Table 1. Video cases completed at CUHK under SLI[illegible]

RATIONALE FOR MAKING THE YFP VIDEOS

The YFP videos comprised CUHK's third set of SLI dynamic video teaching materials. SLI was initiated partly to promote ethical leadership among Hong Kong students about to embark on careers within services industries. Finance is one of Hong Kong's four Pillar Industries along with tourism, trading and logistics, and professional and producer services. Finance accounts for 16.6% of Hong Kong's GDP, less than the 23.4% of trading and

logistics. Finance accounts for 6.3% of the Hong Kong workforce, considerably below trade and logistics’ 20.4%. But these two facts combine to give finance a workforce per capita annual output of \$1.546 million versus trade and logistics’ \$0.673 million, a fact reflected in the high wages in finance [8]. Not surprisingly, students in Hong Kong consider a career in finance desirable.

Table 2. Videos in the flipped classroom

Number	Title	Length (min)	YouTube URL	Location	Public Views	Moodle Views

The column Public Vides shows the numbers of unique viewer of videos posted publically on YouTube. If a single computer, smart phone, notepad, etc. views a video multiple times, it counts as a single view. The column Moodle Views shows the number of total views privately on the CUHK Moodle website, so if a single computer, notepad, smartphone, etc. views the video more than once, the site counts the total number of times that device views the video.

^The Moodle column understates the number of views because an amended video was posted part way through the term, erasing the exiting log of views.

*The Moodle column understates the number of views because for videos placed in a single root directory the number of entrants into the root directory were divided by the number of items in the root directory, assuming that the entrant did not view more than one video for each entry into the root directory.

Yet as an instructor with over two decades of experience in teaching finance, I have been struck by how little undergraduate students actually know about the work of finance service professionals. This lack of understanding, both before and after taking the course in financial management required to graduate with a bachelor of business administration, is especially worrying in the light of the public perception, strengthened after the global financial crisis, that the finance industry in particular and multinational corporations in general are cursed by “...a systemic breakdown in accountability and ethics...” [9, 10]. My casual observations as a former banker in Hong Kong together with current financial academic research leads me to believe that, in fact, financial professionals’ moral standards are insignificantly different from the general population and that progressing to a leadership position in finance is *facilitated*, not hindered by self-transcendence [11]. This observation and research is consistent with the emphasis on competence, character and care promoted by SLI [1]. We produced the YFP

videos to inform students of what careers in finance entail from not only a technical, but also a moral point of view.

Although CUHK's Office of Student Affairs, the CUHK School of Business Undergraduate Office's Student Career Planning and Development Division, each of CUHK's nine colleges, each specialized program and many of student societies bring senior financial professionals onto campus to speak with students about career prospects, we reasoned that students could learn more from *young* service professionals. Not only are they closer to our students' ages, not only is their work more like that which our students can expect to do upon graduation, but also they can illustrate our premise that every service employee is, by nature of the service industry, a leader at some time during each day [12].

THE PROCESS

We interviewed 15 alumni who had graduated within the last 10 years (i.e., no earlier than 2002). Each interviewee worked either in a financial service company or as a financial professional (involved in treasury or control) in a non-financial firm. Our interviews involved asking the open-ended questions shown in Table 3. We followed up interviewee answers with further unstructured questions. We asked questions largely in English but followed up in Cantonese, so that we could present the YFP as a global financial service provider with a local Hong Kong cultural base. We video recorded each interview, with each interview lasting from 45 minutes to 1.5 hours. We edited 15 sets of four, two to 10 minutes videos in which the interviewees discussed four aspects of their work *i. Work Content*, *ii. Theory and Practice*, *iii. Success*, and *iv. Improving Service*, giving us 60 videos. All but one YFP allowed us to use at least some part of the materials we had edited. Four YFPs required major editing of their videos and gave their permission on the basis that their companies' names should not be mentioned, or said that, if their companies' names were used, they would have to clear the videos through their corporate compliance departments. Our experience with corporate compliance departments led us to volunteer editing out of company names, a proposal that led all but one YFP to accept publication. The YFP who refused to give permission said that the editing quality of our work was not sufficiently high to warrant release and consequent lowering the reputation of CUHK. One YFP who allowed us to use his interview requested that we remove all of aspect *iv. Improving service* giving us 55 videos at the end of our work. Table 4 gives the names and titles of the 14 YFPs.

We placed all videos on the Instructors' Corner of the Service Leadership Website [13] discussed in our day one paper in this volume [1], rather than YouTube because in our approach to the YFPs we said that publication would be public but targeted towards the SLI community. We did not track visits to individual videos on the Service Leadership Website.

SUCCESS FACTORS

The YFP videos have so far been used in the Fina2010 *Financial Management* flipped classroom outlined in Table 2 from September to December 2015. Aspects *i. Work Content* and *ii. Theory and Practice* were used in classroom exercises to increase practical

understanding of material covered in the flipped lectures 1. *What is Finance*, 2. *Jobs in Finance*, 12. *Pro-forma forecasting*, 13. *Banks*, 14. *The Perspective of the Lender*, 19. *Bond and Stock Valuation*, 20. *Capital Budgeting*, 23. *Cost of Capital: WACC*, and 26. *The Weighted Average Cost of Capital: Equity – CAPM*. Materials from aspects iii. *Success* and iv. *Improving Service* were used in the first and the final class to place finance in a moral context. Students expressed interest in seeing their near-peers discussing important aspects of the work of financial professionals.

Table 3. Interview questions for young financial professionals

1.	Work Content
a.	How does your division of the company make money? i.e., what is the business model?
b.	Describe your job.
c.	How do you help your company's customers?
d.	Describe the percent of your time used on
	i. Meeting with customers
	ii. Meeting with colleagues
	iii. Researching and analyzing
	iv. Writing reports
	v. Other activities (specify if over 10%)
2.	Measuring Success
a.	Describe a highly successful incident at work
b.	Describe a failure at work. How do you find out how to improve your service?
c.	How is your success or failure in your job assessed?
3.	Improving Service
a.	What personal characteristics are most important to your continued success? [follow up with one of the following]
	i. How is empathy important to your success or failure?
	ii. How is self-control important to your success or failure?
	iii. How do you deal with inertia in your company?
	iv. In working with colleagues, do you primarily use authority or persuasion?
b.	One leader commented, "Everyone is a leader for at least 15 minutes each day." How true is this true in your organization?
4.	Theory and Practice
a.	Which concepts from introductory financial management are most important to you in your work and why?
b.	How do you use the following concepts in your work [Choose one, avoiding that covered in a. If the interviewee does not use your chosen topic, go on to the next one and so on until you come to one the interviewee uses. In subsequent interviews, start with the ones that were not chosen.]
	i. Financial Statement Analysis
	ii. Risk and return
	iii. Discounted cash flow analysis
	iv. Capital budgeting
	v. Correlation and diversification
	vi. Market efficiency
	vii. Cost of capital
	viii. Capital structure
	ix. Dividend Policy
	x. Cash and Liquidity Management
	xi. Options Valuation
	xii. Agency conflicts
5.	How have you improved your knowledge of finance since graduation?
6.	Would you be willing to appear in class on a Skype call?
7.	Can we release your email address to our students for them to directly contact you?

Table 4. Young financial professional interviewees

Surname	Given Name	Company	Job title	Customers	Work Content
Commercial Bankers					
Chan	Leo	JPMorgan	Investment Consultant Analyst	HNW Individuals	Private Banking
Yan	Elaine	a leading bank	Senior Direct Channels Manager	Retail	Web and Mobile
Hung	Raymond	Industrial Bank	AVP Financial Markets	Corporate	FX Options / Treasury
Tam	David	a leading bank	Manager of Regulatory Reporting	Corporates	Derivatives trading compliance
Investment Bankers and Asset Managers					
Ngai	Anthony	JP Morgan	Credit Trading Department	Asset Managers	Trading and advice
Cheng	Ben	BofA Merrill Lynch	Associate Investment Banking Dept	Financial Institutions, Large Corps	Sales
Chan	Michael	a leading bank	ECM Practitioner	Financial Institutions, Large Corps	Execution
Tang	Benson	Investco Hong Kong	Senior Analyst, Investment Risk & Performance	Institutional and Retail investors --	Fund Management
Insurance Professionals					
Chan	Herman	Manulife	Financial Planning Officer	Individuals buying Life Insurance	Sales
Wong	Ken	a leading insurance brokerage	Financial Analyst	Corporations buying P&C Insurance	Control budgeting, forecasting; reconciling
Financial Professionals in Non-Financial Institutions					
Leung	Fanny	HYVA Holdings	Senior Financial Analyst	Buyers of Construction Equipment	Control: budgeting, forecasting; reconciling
Tam	Carine	Pacific Plywood Holdings	Company Secretary and Controller	Investors and consulting clients	Filings, Listing compliance
Chau	Terence	Deloitte	Senior Consultant	Financial Institutions	Regulatory Advice, compliance
Li	Angela	McKinsey	Business Analyst	Financial Institutions, Large Corps	Strategic Advice

Here, I summarize the major success factors as reported by YFPs in the videos. I invite the readers to go to the videos to confirm my summaries, to share the videos with their students and to use the videos in their classes. Among the bankers, Leo Chan, private banker at JP Morgan saw good performance in the banker-client relationship as the key. Elaine Yen, Direct Channel Sales Manager at a leading bank, in charge of website interfaces for internet identified "... design for customer experience ..." as the key. Raymond Hung, AVP, Financial Markets at Industrial Bank saw the profit and loss statement – making money – as the number one success factor while David Tam, Manager of Regulatory Performance at a leading bank advised, "...be timely, precise and accurate." We interviewed four professionals in the field of investment banking and asset management: Anthony Ngai of JP Morgan Credit Trading, Ben Cheng of Corporate Sales at BofA Merrill Lynch, Michael Chan, equity markets execution at a leading investment bank and Benson Tang, Senior Analyst (quant modelling) at Investco. Their comments emphasized the necessity of preserving the franchises of their financial institutions through improving their institutional reputations. The clients' interests must come first. Communication with clients has to be timely, of high quality, accurate and good. Pricing (in IPOs) must be fair to clients on both the sell and the buy sides of each transaction. And the models designed for use by colleagues must not only work well but must be understood by colleagues so that colleagues are confident to use them to enhance

performance. Among all four answers, a strong commitment to service was evident. Our two insurance professionals, Ben Chan at Manulife and Ken Wong at a leading property and casualty brokerage, identified two key factors of success: winning and keeping the trust of customers and accuracy in work. Financial practitioners in non-financial corporations also identified key SLI factors. Fanny Leung, Senior Financial Analyst in regional control at HYVA Holdings, said that two factors were paramount: understanding her company's needs and meeting deadlines. Carine Tam, Company Secretary and Controller of Pacific Plywood Holdings said that her two key success factors were multi-tasking and staying calm. Two financial consultants rounded out our 14 YFPs: Terence Chau, Senior Consultant at Deloitte's financial intermediary compliance advisory practice and Angela Li, Business Analyst at McKinsey, came to identical conclusions using different words. The former said that the key was to "... make our customer happy..." while the latter said "...our customer's success is our success."

CONCLUSION

Using a dynamic approach helps link theory with practice in demonstrating to students the importance of SLI concepts. At CUHK we have achieved minor successes in adding a dynamic component to the teaching of service leadership: we have produced and tested 94 videos clips and 11 written cases. We are confident that the flipped classroom presents a medium for effective instruction. The YFP series demonstrates that students can be brought closer to their chosen finance careers before they leave school. The classroom can both inform them and instruct them concerning the moral dimension of a service industry career. Expansion of the YFP approach to other service disciplines beyond finance, including trade, logistics, business services, hospitality, healthcare, education etc., is viable. Tremendous potential exists for further applied research into service leadership in Hong Kong and the improvement of delivery of service leadership knowledge. To realize this potential, however, coordinated involvement of researchers and instructors at universities with practitioners' service industries is critical to create a truly Hong Kong-wide platform that is content-rich, useful, current, relevant and accessible.

ACKNOWLEDGMENTS

The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

ABSTRACT

In this chapter, we elucidate the experiences of service leadership development at The Education University of Hong Kong (EdUHK). Adopting the vision and missions of Fung Service Leadership Initiative, EdUHK launched the “Achiever” project in September 2012. The project aimed to develop service leadership qualities in students. In September 2015, this “Achiever” project was completed but the learning achievements generated from it will sustain. “Achiever” was developed in a co-curricular context and its development was based on three core beliefs of service leadership as well as a road map which comprised a three-phase training framework and a five-level student leadership development model. In the three-year duration of project development, over 1,000 students from different disciplines accumulated 73,698 learning hours in 13 designated co-curricular activities. Over 90% of the participating students reported that through “Achiever”, they enhanced their self-understanding, goal-setting skills and their abilities to appreciate others. Meanwhile, over 70% of students believed that caring and compassion were essential personal qualities of a service leader. We believe that the recognition of such qualities by our young generation will be beneficial to societal development as this shows their compassion to serve. The project aimed to be student-oriented by nature. EdUHK built a peer learning environment and an active sharing platform so that students could share their thoughts and experiences openly and freely. The development of supportive learning environment encouraged students to actively

¹ The Hong Kong Institute of Education (HKIEd) was retitled The Education University of Hong Kong (EdUHK) on 27 May 2016.

apply newly-acquired service leadership knowledge and skills to community development when they engaged in community service projects.

INTRODUCTION

With the sponsorship of Victor and William Fung Foundation and the support of the Hong Kong Institute of Service Leadership and Management (HKI-SLAM), The Education University of Hong Kong (EdUHK) conducted a three-year co-curricular learning project named “Prospective Service Leaders Enhancement Project” (hereafter called “Achiever”) from September 2012 to September 2015.

A number of scholars have been developing concepts of service leadership [1-3]. Following their footsteps, the “Achiever” aimed at grooming prospective students to become quality and committed service leaders through the provisions of different training activities and experiential learning opportunities. It was operated by the Student Affairs Office (SAO) in EdUHK. EdUHK emphasized providing practice opportunities for students with diversified learning needs and active reflections on learning achievements.

In particular, through the construction of a systematic student leadership development model and a three-phase training structure, EdUHK intended to develop a student-oriented service leadership development process. In this chapter, EdUHK shares the experiences with reference to the achievements, impacts and lessons learned from this “Achiever”. Students’ feedback is included to illustrate their learning.

SUMMARY OF ACHIEVEMENTS

“Achiever” was developed in a co-curricular context based on three core beliefs (see Figure 1): (a) everyone is a leader; (b) quality service leadership is built on three critical people factors: competency, character and care; and (c) the server is the service. These three core beliefs, found in *Service Reborn* [1], formed the backbone of students’ service leadership development in EdUHK. Kouzes and Posner [4] also posit that leadership is everyone’s business. They tend to inform that this “everyone” should include university students who are future leaders in the community. Posner [5] remarks that leadership development is an integral part of the educational programme of college students. His views are especially true for EdUHK as it nurtures teachers-to-be. Through “Achiever”, EdUHK communicated, encouraged, empowered and equipped students with the three core beliefs in a variety of student activities and prepared them to be service leaders.

Figure 1. Three core beliefs of service leadership.

Consolidation of a Three-Phase Training Structure

Komives [6] and her colleagues argue that leadership needs to be learnt and practiced. A three-phase training structure was thus established in “Achiever” (see Figure 2) which adopted experiential learning methods and also emphasized the importance of practice.

Phase One Foundation	Phase Two Self-Advancement	Phase Three Integration
Objective: - To help students build up fundamental knowledge on Service Leadership - To enhance self-understanding	Objective: To help students identify personal qualities that contribute to the nurture of a successful service leader	Objective: To apply and practise skills and knowledge acquired in real-life situations through experiential learning activities (<i>See Appendix 1 for experiential learning activities developed in EdUHK from 2012 to 2015</i>)

Figure 2. The three-phase training structure of “Achiever”.

Following this systematic training structure, programmes in the SAO were developed in which the participating students would go through a progressive learning process of acquiring fundamental knowledge and concepts of service leadership, setting their own learning goals (Phase One-Foundation), identifying their service leadership qualities through interviewing role models or joining adventure-based activities (Phase Two-Self-Advancement), and applying their newly-learnt service leadership knowledge and skills through various experiential learning activities in real-life context (Phase Three-Integration). Through this learning process, EdUHK nurtured students’ serving mindset as well as enhanced their capability in serving others when they led and engaged in activities that helped community development both locally and overseas. This training structure has also provided a good direction for SAO when designing learning activities for nurturing service leaders.

The Leadership Enhancement and Development (LEAD) Programme (Appendix 1) helps to illustrate how this structure was applied. In 2014/15, 205 selected students attended a talk on service leadership and two workshops on enhancing self-understanding and setting goals (Phase One). They then conducted interviews with role models, who were service leaders, to identify important service leadership qualities and explored areas for self-improvement in adventure-based training (Phase Two). In Phase Three, they applied and practised skills and knowledge acquired to serve overseas communities in developing countries such as Bangladesh, Cambodia or Vietnam. Upon their return to the campus, they took up mentors’ role and helped new participants of the programme.

Construction of a Student Leadership Development Model

To cope with the diversified developmental needs of students, EdUHK constructed a five-level student leadership development model. This model functioned as a road map guiding students to build up their leadership capacity through different leadership engagement levels in a variety of programmes.

Figure 3. Five-level student leadership development model.

In a case study of a university conducted by Smith and Rodgers [7, p.479], they found that active student involvement in meaningful experiences was implemented through a multi-phase development model. Going through these phases, students would 1) act as participants, 2) have significant involvement and responsibility, 3) take up leadership role, and 4) assume a peer mentoring or training role. The EdUHK student leadership development model covered similar levels but a “Transforming” level was added. At this uppermost level, students continue to take initiative to serve the community after graduation and act as role models to undergraduate students in EdUHK. An alumni network will be developed and community development can be done with concerted efforts.

By participating in programmes that required different leadership engagement levels, students were expected to enhance their leadership competencies and commitment to serve others and to build a caring community. The following illustrates students’ learning achievements in different development levels.

1. Participating (Level One)

At “Participating” level, students acquired knowledge and skills through active participation in programmes and activities organized for them. Through active participation, students were expected to enhance their confidence and awareness of being service leaders. They were guided to form positive values towards community contribution. The following are

some students' feedback on positive experiences as a participant in an experiential learning programme:

"The goal setting workshop was beneficial to me on planning my long-term career and setting my own goals in the summer internship programme."

"The psychological testing and assessments (i.e., MBTI, Self-Directed Search) provided a great help in my career planning and self-understanding."

"Caring for others' feelings makes others feel being respected."

2. Organizing (Level Two)

At "Organizing" level, students were involved in planning and organizing functions with intensive coaching support. The Community Service Exposure Attachment (CSEA) programme served students' developmental needs at this level.

In CSEA, students were arranged to work for non-governmental organizations (NGOs) or social enterprises (SEs) to develop their leadership skills such as organizing skills and communication skills through assisting social welfare professionals in organizing service events. In 2015, 13 students took part in the programme. The following are some of their learning reflections:

"During the service attachment, I organized many activities for the children. It was not easy for me at the beginning since I was unfamiliar with the social welfare field. However, under the guidance of some experienced social workers, I gradually adopted practical methods to organize and conduct service activities."

"I have known more about how an NGO runs and what the general and complete procedure is for holding an activity."

3. Mentoring (Level Three)

Participants with outstanding performance in the programme were selected to take up coaching roles and served as mentors to new participants of various experiential learning activities, thereby building up a peer learning atmosphere. Boud [8] mentions that peer learning is a beneficial process for mutual sharing of knowledge, ideas and experience between participants. He tends to imply that students, by taking up the role of mentor and mentee, are peers and will become effective learners through presentation of their ideas and thoughts. In the LEAD Programme, students with mentoring roles coached and guided mentees to learn. They led small group meetings and team-building activities. A mentor in LEAD Laos group shared his own learning:

"I learned how to unite team members with different characters to work out challenging tasks. Being a translator between members and Laos' volunteers, I understood my strengths and weaknesses of being a leader."

4. Consolidating (Level Four)

At "Consolidating" level, students were expected to initiate new projects and fully apply their skills and knowledge acquired in previous developmental levels. The Service Exposure for Global Awareness (SEGA) Programme (Appendix 1) encouraged students to explore social issues in Hong Kong and Asia. The students worked on a highly autonomous level, formed their own teams, selected their study areas and planned their service tours. The following quotes show the learning achievements of two students:

“I can learn more about different social needs and issues from an international perspective, and be able to respect and appreciate human lives.”

“Through understanding the actual needs and listening to voices from the most disadvantaged groups, it makes me realize that life is not only about myself, but also the others in need.”

Activities at this level also included internship programmes, which allowed students to apply their skills and knowledge acquired in workplace. With actual practice in workplace, students expanded their circle of influence and strengthened their linkage with the wider community.

5. Transforming (Level Five)

When students can be self-initiative and self-directive in offering their services to the wider community after graduation, they then reach this uppermost leadership developmental level of “Transforming”. Graduates can engage in alumni network and work closely with other graduates to continue serving the community.

The Impacts of “Achiever”

Over 1,000 students participated in a variety of programmes developed under “Achiever”, accumulating a total of 73,698 learning hours. As mentioned earlier, while gaining their own learning, students also contributed to the learning of other students through different sharing platforms. This reciprocal learning mode built up a peer learning atmosphere in EdUHK and reinforced students’ acquisition of service leadership core beliefs, skills and knowledge. Frequent learning evaluation was a feature of “Achiever”. Under “Achiever”, EdUHK collected feedback and comments from students through different channels such as self-administered questionnaires, reflections in learning journals and direct sharing between students.

By way of filling in questionnaires students reported their experiences in talks and workshops. Over 90% of them experienced enhancement in their self-understanding, goal-setting skills and their abilities to appreciate others with diverse backgrounds. Meanwhile, many participants identified and planned to adopt four essential service leadership qualities: Care and Compassion, Happiness, Leadership, and Social Relationship after attending programmes developed at Phase Two of the training structure. From attending the experiential learning activities, many students gained positive experiences and understood the importance of teamwork. Through real-life practices, they identified their areas for improvement.

Two students, Helen and Michael, who took part in “Achiever”, presented their experiences in the International Conference on “Service Leadership Education in Service Economies” in January 2016. They shared their learning experience at the five levels of leadership development.

At the “Participating” level they were able to learn through observation. While making a presentation on Hong Kong films in an ambassador programme, Helen noticed the various styles among participants with different cultural backgrounds. For example, local Hong Kong students would give an overview of the issue, mainland China students would provide in-

depth information on a specific area, and international students would integrate their content into interactive games. Through observation, Helen was able to appreciate the strengths and weaknesses of other students, thus identifying those of her own.

Figure 4. Impacts of learning achievements under “Achiever”.

After participating in the project, the students would take up a more significant role as organizer. During a New Student Orientation Camp at EdUHK, Michael was in charge of delivering a talk on campus activities to new students due to his good presentation skills, while other students were also appointed as persons in charge of activities based on their areas of excellence. This allowed Michael to understand the notion of “everyone is a leader” truly and to witness how this concerted effort was vital to the success of the camp.

When students successfully completed the first two levels of development, they were eligible to become a mentor to guide and take care of less experienced students. Helen became a mentor of a voluntary teaching trip to mainland China after drawing inspiration from her mentor. During the trip, she found a communication gap between two mentees and bridged it by bringing up common topics. The solution may be simple but Helen’s passion and care were crucial in nurturing a supportive peer learning community. We hope that this mentorship programme could encourage more students to take up mentoring role in the future.

At level four “Consolidating”, students would reflect constantly on their learning in the first three levels by using EdUHK’s online portfolio system. Through the writing of reflective journals or essays, they could reflect on their experiences as a whole and therefore acquired a better view of their talents and shortcomings. This realization process enabled the students to further explore new opportunities provided by EdUHK that matched their interests, whether it was to enhance their talents or to overcome their shortcomings. EdUHK is like an airport, offering a supportive learning environment and helping students to reach their desired destinations.

Finally, the character and mentality of the students became more mature after these experiences. They were able to step out of their comfort zone, cope with unfamiliar environments and conquer adverse circumstances. Michael’s internship in Germany confronted him with numerous challenges, but he overcame them by reminding himself of the training in “Achiever” and of the spirit “the server is the service.” He was able to manage his emotions immediately and to undertake his role as an intern with efficiency. Michael reflected

that his higher level of problem solving capability and adversity intelligence would not have been attained without his going through the different levels of leadership development. This showed the effectiveness of “Achiever” in developing students to be caring and responsible professionals.

Impacts on Student Community

A sharing platform was created for participants of “Achiever” to actively share their learning on service leadership to other EdUHK students. Through it, students expanded their sphere of influence in the student community and helped promote service leadership on campus when building up their leadership qualities.

A Poster Conference on Service Leadership was held in March 2015 with the aim to give an overview of the work completed under “Achiever”. During the conference, students who had attended different experiential learning activities reflected on and shared the core concepts of service leadership and their application experiences. Over 60 participants from EdUHK and partner universities attended the conference.

Besides, a Whole-person Development Activities Sharing Carnival was organized at the beginning of the first semester of 2015/16 to encourage new students to join student development activities and to build up a sharing culture in EdUHK students’ community.

Impacts on Society

At the final phase of each programme, students applied skills and knowledge in real-life context. Through serving society, students raised their social awareness and strengthened their connection with society. Some students shared their experiences in local newspapers. By doing so, students were promoting the notion of social responsibility and service leadership not only to the students on campus, but also to the public.

Critical Success Factors

“Achiever” is found to be developed from some critical factors. The first factor is a supportive learning environment which is built on the development of a variety of programmes. The other factors include the creation of a road map for student development and programme design, the emphasis on applications, the mutual peer learning opportunities, and the frequent assessments for continuous improvement of both the students and the programmes. These critical factors appear to equate with the learning facilitating conditions proposed by Brown [9], which include the development of a seamless learning environment, a focused picture of student development, the provision of rich array of learning experiences for students and the continued opportunities for student involvement.

SUSTAINABILITY AND FUTURE DIRECTION OF SERVICE LEADERSHIP INITIATIVE

The advocacy of service leadership will continue to thrive in our society. EdUHK will continue to nurture students' social awareness, and help them to understand that service includes self-serving efforts which aim at ethically improving one's competencies, abilities, and willingness to help satisfy the needs of others. EdUHK will continue to apply the integrated structure of "Achiever" (Appendix 2) to its current and upcoming activities.

APPENDIX 1. EXPERIENTIAL LEARNING ACTIVITIES DEVELOPED IN EDUHK FROM 2012 TO 2015

	2012/13	2013/14	2014/15

APPENDIX 2. INTEGRATED STRUCTURE OF “ACHIEVER”

ACKNOWLEDGMENTS

We would like to thank the colleagues who dedicated their efforts in helping the development of students under “Achiever”, leading to the establishment of the integrated structure of “Achiever”. We would like to extend our sincerest gratitude to Ms. Chan Yiu Kwan, Priscilla, Student Development Executive of Student Affairs Office, students Guan Hai Yue, Helen and Leung Wai Ho, Michael who contributed to the content development of the article.

The Fung Service Leadership Education Initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

ABSTRACT

In this chapter we outline the achievements of The Hong Kong Polytechnic University (PolyU) in the 3-year Fung Service Leadership Initiative. In terms of curriculum development, PolyU has developed and offered several credit-bearing subjects and non-credit-bearing programs. Utilizing different evaluative strategies, both

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

quantitative and qualitative data suggest that the credit-bearing subjects and non-credit-bearing programs yielded positive impacts on students' development. In terms of research, publications on service leadership have been generated from the project, including journal articles, conference paper presentations, books and book chapters. Reflections and lessons learned from the three-year journey are shared. Particularly, insights on collaboration, research and evaluation, as well as recommendations on how to take the initiative forward both in terms of research and practice are discussed.

INTRODUCTION

The present chapter outlines the achievements and related experiences pertinent to the Fung Service Leadership Initiative (2012-2015) implemented at The Hong Kong Polytechnic University. There are several sections in this paper. First, credit-bearing Service Leadership subjects developed in this period are presented. Second, non-credit-bearing Service Leadership programs are described. Third, research studies in the Service Leadership Initiative are outlined. Finally, experience gained and lessons learned are discussed.

Teaching Activities

As a part of the Fung Service Leadership Initiative sponsored by the Victor and William Fung Foundation to promote service leadership, four credit-bearing courses and four non-credit-bearing programs have been offered to students at The Hong Kong Polytechnic University (PolyU) and students of other tertiary institutions in Hong Kong. In addition, research activities have also been undertaken by the PolyU Team. The present report outlines both teaching and research activities at PolyU since the inception of the Initiative in 2012.

For credit-bearing subjects, four subjects were developed and offered to the students. Primarily, a 2-credit subject "Service Leadership" (APSS2820) was developed and offered to students studying under the 3-year undergraduate curriculum (i.e., old curriculum for A-level students). This subject was offered to students in the 2012/13 and 2013/14 academic years ($N = 190$). Upon completion of the subject, students are expected to gain knowledge on the theories and concepts related to service leadership and to appreciate and understand the importance of service leadership to one's personal development and the society. Modeled after the 2-credit subject, another 3-credit subject entitled "Service Leadership" (APSSA1A21) in the Cluster Area Requirement was developed for students of the 4-year curriculum (i.e., the new 4-year curriculum for graduates of the Diploma of Secondary Education Examination). This subject includes an additional component on the critical appraisal of the Service Leadership model proposed by HKI-SLAM and other major leadership models. To enhance the English proficiency of students, this subject also includes a component on English Reading and Writing requirements. The subject was offered twice since the 2014/15 academic year ($N = 176$). Based on APSS2820, a free elective 3-credit "Service Leadership" subject was developed for students studying in the 4-year curriculum. The subject is offered by the Department of Applied Social Sciences. This subject focuses on the critical evaluation of different leadership models, including the HKI-SLAM model.

In addition to the above credit-bearing subjects that are “classroom-based,” a service learning subject on service leadership utilizing both classroom and outside classroom teaching and learning strategies has been developed. A subject entitled “Service Leadership through Serving Children and Families with Special Needs” (APSS2S09) was designed to enable students to know the core attributes of service leaders, apply the service leadership concepts and skills through the engagement of community-based service activities, develop self-awareness of sharing and empathy with others and the community, and reflect on their service leadership qualities, particularly intrapersonal and interpersonal competencies. To date, students have provided services in special schools admitting boys with behavioral and emotional problems (Society of Boys’ Centres), a non-governmental organization providing service for pre-school children with developmental disorders and mental retardation (Heep Hong Society), a drug rehabilitation agency (Christian Zheng Sheng College) and schools admitting students with social and economic deprivation (schools in Project We Can initiated and financially supported by Wharf). The subject was offered to students since the 2013/14 academic year ($N = 341$).

Besides credit-bearing subjects, non-credit-bearing service leadership programs have also been designed. A modified version of the Service Leadership subject (4.5 days) was offered to students joining the Global Youth Leadership Program jointly organized by The Hong Kong Polytechnic University and Peking University in Beijing in July 2013 ($N = 48$). Several service leadership training workshops have also been developed and offered to members of Wofoo Leaders’ Network ($N = 312$) and as a part of the service learning scholarship program at the Hong Kong Polytechnic University as well ($N = 72$). In 2015, a condensed program on service leadership was offered to students joining the Silk Road Youth Leadership Program jointly organized by The Hong Kong Polytechnic University, Peking University and Xi’an Jiaotong University ($N = 50$).

In summary, since the inception of the Fung Service Leadership Initiative at PolyU, a total of 1,040 students were nurtured to become service leaders through participation in credit-bearing subjects and non-credit-bearing programs.

Research Activities

Primarily, evaluation research is central to the development of Service Leadership education at PolyU. Multiple evaluation strategies have been used to evaluate the credit-bearing and non-credit-bearing service leadership training programs. Quantitative (i.e., objective outcome evaluation, subjective outcome evaluation, and process evaluation) and qualitative (i.e., focus group interview and personal reflection) methodologies were employed. Taken as a whole, evaluation findings provide evidence that students were highly satisfied with the service leadership subjects and training programs. Most importantly, the subject and programs enabled students to gain service leadership attributes and yielded positive impacts on their development. To date, 12 refereed journal articles have been published or accepted for publication based on the evaluation studies [1-8].

In addition to evaluation research, the PolyU team has embarked on several research initiatives in terms of scale development. First, a scale assessing service leadership knowledge and qualities has been developed to gauge students’ changes after taking service

leadership subjects. Second, a research project on the relevance of Confucian virtues to service leadership was carried out. A Chinese Character Strengths Scale has been developed to assess students' Confucian virtues. Data have been collected from 2,887 students and journal articles will be published based on the findings. Third, The Service Leadership Scale research project was launched in July 2015 which aims to develop a multidimensional measure to assess the qualities of service leaders as outlined by the Service Leadership model, and to validate the developed instrument. Specifically, three scales (Knowledge, Behavior/Skills and Attitudes/Beliefs/Values Scales on Service Leadership) will be developed.

In order to allow scholars, practitioners, and the public to better understand service leadership, the PolyU team has presented papers at international conferences and published journal articles and a book. In terms of conferences, three papers on the key concepts and curriculum materials were presented at the Third International Congress on Pediatric Chronic Diseases, Disability and Human Development held on December 2-5, 2012 in Jerusalem, Israel. Moreover, a Service Leadership Roundtable was held on March 22, 2013, at The Hong Kong Polytechnic University, Hong Kong. In that roundtable, our research team gave multiple presentations about Service Leadership education and curriculum development at PolyU. Two papers were presented at the International Conference on Service Leadership Education for University Students: Experience in Hong Kong held on May 14-15, 2014 at The Hong Kong Polytechnic University. In the first paper, credit-bearing subjects and non-credit-bearing programs were described. In the second paper, evaluation studies were presented.

In terms of publication, two special issues of the *International Journal on Disability and Human Development* documenting evaluation studies' findings, the curriculum of the Service Leadership model, including the distinction between manufacturing and service economies and comparison between the Service Leadership model and existing major leadership models in the scientific literature, have been published [9-18]. Furthermore, Chinese articles have also been published in the Hong Kong and Macau Affairs discussing the importance of service leadership for Hong Kong's competitiveness and how to nurture service leaders among Hong Kong students. Lastly, a book entitled "Promoting Service Leadership Qualities in University Students: The Case of Hong Kong" was published in summer 2015 with Prof. Daniel Shek and Dr. Po Chung as Editors, and Dr. Hildie Leung and Dr. Li Lin as the Managing Editors. The book includes keynote speeches, welcoming addresses, and papers presented at the International Conference of Service Leadership Education: Experience in Hong Kong in May 2014 [19-22]. In summary, a total of 51 publications were produced by the PolyU team.

Reflections and Learning Points

There are several learning points from the project. Primarily, the development of the Service Leadership curriculum (including credit-bearing subjects and non-credit-bearing programs) forms a solid basis for Service Leadership education in Hong Kong. The related curriculum materials, assessment methods, and publications are important for the long-term sustainability of the initiative in the higher education sector. One obvious obstacle for Service

Leadership education in Hong Kong is the lack of curriculum materials and subjects. As such, development of the four subjects and the non-credit-bearing subjects at PolyU is helpful to take the Service Leadership education subjects forward.

Second, the project shows that experiential learning is a desirable learning approach in Service Leadership education. There were several features of Service Leadership subjects and programs developed at PolyU. Primarily, besides short lectures, interactive learning activities including role play and structured activities were used. In addition, collaborative learning through discussion, sharing, and presentation in groups was emphasized. Furthermore, students were encouraged to have reflective learning throughout the subject or program. Essentially, the students were encouraged to have reflections about their knowledge, attitudes and behavior with reference to the Service Leadership model.

Third, our experience suggests that Service-Learning is a good pedagogy for Service Leadership education. Through service-learning, students can have opportunities to reflect on their knowledge, attitudes and skills about Service Leadership, particularly moral character (such as sense of responsibility and trustworthiness) and caring dispositions (such as empathy and having passion about the needy). In essence, through the service-learning projects developed and service-learning hours performed by the students, the students can learn more about Service Leadership attributes.

Fourth, this project underscores the importance of using systematic evaluation methods to assess the impact of Service Leadership Initiative. In the present context, objective outcome evaluation adopting the one group pretest-posttest design was used. In the case of the Global Youth Leadership Program, multiple waves of data were in fact collected. Subjective outcome evaluation (i.e., the client satisfaction approach) was also adopted to gauge the views of the students. Besides, process evaluation was used to understand the implementation quality and adherence to the developed materials. Finally, qualitative evaluation is a good way to understand the subjective views of the students who take the subject or program. It is argued that Service Leadership subjects or programs developed should be properly evaluated to understand the impacts on the students.

Fifth, we must conduct systematic research on Service Leadership model. There are still many questions to be answered with reference to the SLAM model. Some questions include: What are the unique features of the model as compared to other mainstream leadership models? What antecedents influence the development of service leadership qualities? What are the consequences of having service leadership qualities? What should be the ingredients of moral character? How can we nurture trust in service leaders? Is Service Leadership related to productivity? Obviously, more research should be done to strengthen the body of knowledge on Service Leadership.

Sixth, it is important to document research and education on Service Leadership. In particular, there is a need to build up the literature on Service Leadership. Obviously, without published work on Service Leadership, it would be difficult to develop Service Leadership education. In particular, scientific reports on the effectiveness of Service Leadership education should also be stepped up.

Finally, the Service Leadership Initiative is an excellent example of collaboration between the commercial sector and the higher education sector. For the contribution of the commercial sector, the Victor and William Fung Foundation provides the financial support and the Hong Kong Institute of Service Leadership & Management Limited provides the Service Leadership model and curriculum framework. For the contribution of the higher

education sector, different curriculum materials, subjects, and programs have been developed. In the last three years, we can use the description of “let the hundred flowers bloom” to represent the work done. In future, consolidation of the work done and adoption of a more focused approach would be important.

ACKNOWLEDGMENTS

The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

Chapter 114

SERVICE LEADERSHIP COMMUNITY BLOOMING

***Leo K. W. Hui*, MEng, PhD, Ben Y. B. Chan, PhD
and Ting-Chuen Pong, PhD***

Center for Engineering Education Innovation,
The Hong Kong University of Science and Technology,
Hong Kong, PR China

ABSTRACT

After three years of seeding, watering and nourishing, the service leadership community of The Hong Kong University of Science and Technology (HKUST) is in full bloom. Diversified components in the community help students learn as apprentices, experience as practitioners and ultimately develop as service leaders. The leadership corner area at the Engineering Commons acts as a starting point to raise students' awareness of service leadership. The *EnG Chitchat*, an open idea-sharing forum, provides opportunities for students to inquire about service leadership and to learn how their expertise can be applied to satisfy people's needs. When students would like to practice service leadership, they can join the peer mentoring program (PMP). Over 200 senior students became peer mentors, providing academic advice, campus life information and social support to their mentees. In a survey of how first-year students adapt to university life, over one-third of students agreed peer mentors were helpful to them. Regarding service leader development, various service learning courses are available and open to students with different disciplines. From the trolley design for the elderly to the mobile App development for hearing impaired children, students apply their expertise to satisfy the needs of certain people in society. Students are also empowered to identify and satisfy people's needs on their own as we have a program of student-initiated service projects in our service leadership community. To keep improving the established community, we continuously conduct research, aiming to discover more effective and innovative ways to promote service leadership at the university.

* Corresponding Author's Email: egleo@ust.hk.

INTRODUCTION

In 2012, the Victor and William Fung Foundation and the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) collaborated to provide financial and informative support to 8 UGC-funded institutions for the sustainable development and promotion of Service Leadership to tertiary students. At The Hong Kong University of Science and Technology (HKUST), the Center for Engineering Education Innovation (E²I) of the School of Engineering has established a Learning Community to nurture the mindset of service leadership in students [1]. The community provides different components to help students understand, practice, and develop service leadership. All components are also targeted to the personal development of students in leadership roles to become Service Leaders. The purpose of this chapter is to share the processes, outcomes, and experience gained by HKUST from the development of a service leadership community.

SERVICE LEADERSHIP COMMUNITY

In the community, the components are grouped into three types of platforms and each platform has its unique purpose so that students can achieve different levels of learning Service Leadership based on their interests. The apprentice platform serves as the starting point to raise students' awareness on service leadership. When students seek to practice and experience service leadership, they can join the peer mentoring program, a program to train senior students to serve first-year students. If students wish to develop as service leaders, various service learning courses are available for them to take.

Learn as Apprentices

To increase students' exposure to and understanding of service leadership, E²I set up a leadership area to display related information using slideshows, videos, publications and newsletters. Students can study and discover service leadership and how it is important to their future. During regular semesters, an open forum, *EnG Chitchat*, is held weekly for students to understand more about service leadership and how they can apply their technical knowledge to satisfy the people's needs. Based on the feedback of 31 participants from random sampling, 74% enjoyed the forum and over 65% agreed that it increased their interest in making contributions to the community. In addition, the concepts and beliefs of Service Leadership are introduced in a seminar of ENGG 1010 - Academic Orientation for the first-year students and of ENGG 2010 – Engineering Seminar Series. Over 800 students attended the seminars which present lecture materials enabling them to better understand service leadership and inspire them to practice it.

Based on the observations and feedback in *EnG Chitchat* and the students' interest in new technologies, tailor-made courses/workshops are designed to inspire students to learn and develop service leadership through the application of the latest technologies to satisfy people's needs. Service leadership concepts are described in a way of how they can be applied in engineering practice. Then with the understanding of the technologies, students are

asked to apply what they learn to fulfill the needs of the people mentioned in the case studies. A workshop called 3D Printing for Social Good is designed in this way and offered to students. As expected, students are very interested in the workshop and the quota is always completely filled by the second day of registration. In the recent feedback survey, 92% of respondents agreed that the teaching format of the workshop had been well designed to help them learn and the content of the workshop was clear to them. 42% rated the workshop “VERY GOOD” and the rest (58%) rated it “GOOD”. All respondents agreed that leadership is a service in which leaders satisfy the needs of people. 50% of the respondents also mentioned they would strongly recommend the workshop to other students. Thus, it can be observed that one of the feasible ways to attract engineering students to learn Service Leadership is to make a connection of new technologies and their interests with Service Leadership, i.e., how to apply the new technologies to satisfy people’s needs.

Experience as Practitioners

Practice is an indispensable component of leadership development, and clan-based Peer Mentoring Program (PMP) is a straightforward and useful approach for students to practice Service Leadership. In the program, senior students are trained to become peer mentors, providing academic and social support to first-year students who are grouped into respective clans. The mentors advise students in course registration and organize social activities enabling first-year students to adapt to university life. There are also some large events such as Team Building Camp and Rafting Competition for peer mentors and mentees to mingle more with one another, reinforcing their bonding. In addition, to broaden the peer mentors’ horizon, E²I has organized an Intercultural Peer Learning Program for peer mentors to serve the needs of visiting students from other foreign universities.

More than 200 senior students have so far joined the Program and based on the overall program evaluation survey, about 81% of the respondents agreed that leadership is a service aimed at ethically satisfying the needs of self and others, and it can be found all through society, professionally and personally. Also, over 80% believed leaders should self-improve themselves to serve others. From their written comments on their learning in the program, they mostly mentioned their communication skills were improved, implying they could understand the needs of their target people more effectively. They are more confident than before to communicate with students of different cultures and backgrounds, with some also putting themselves in others’ shoes to understand more about their mentees. Being competent at multicultural communication is an asset for students to compete in a service-driven economy like Hong Kong, with clients and customers from all around the world [2]. In the survey of how the first-year students adapt to university life, over 37% of respondents agreed peer mentors were helpful to them, and over 35% said the assistance of peer mentors was useful to them in ongoing professional careers.

It is indisputable that from the program evaluation, most peer mentors understand the main concepts of Service Leadership. However, the feedback of first-year students implied that the peer mentors can work better to serve first-year students. One possible way for improvement is to encourage peer mentors to be more proactive to understand the needs of first-year students through communication and observation. With more training on need

identification and satisfaction, the Peer Mentoring Program is a direct and handy way for students to understand and practice Service Leadership.

Develop as Service Leaders

To become service leaders, students need to learn leadership skills and have opportunities to practice. There are several service learning courses which are designed to help students develop as Service Leaders. ENGG 2900A (Community Service Project: The Way to Success) is a course to help students acquire leadership knowledge and foster their personal development using an interactive teaching approach. They are supervised by the instructor and mentors to design their own group service projects and handle the actual situations by themselves to learn leadership in a realistic way.

From the reflection papers, it is obvious that through the project design and implementation, students can learn and experience more profoundly the concepts of service leadership. In a group service project about selling cookies to raise funds to buy gifts for the homeless, some students recognized the uniqueness of each person and tried to understand their teammates' needs in order to be a successful leader with a sense of responsibility to serve others. In addition, since HKUST is located in a suburban area, some international and even local students may not be familiar with the area to find places for eating, shopping and other leisure activities, so another group developed an online guide for these students. This can show that students who took ENGG 2900A targeted the needs of people when designing their service projects. The other three courses are more technical than ENGG 2900A. They are:

- ENGG 2900B – Community Service Project: Innovative Trolley Design for the Elderly
- ENGG 2900C – Community Service Project: The Mobile App Development for Hearing Impaired Children
- ENGG 2900D – Community Service Project: Underwater Robot Competition Engagement Project

For these types of courses, students apply their technical knowledge to serve the targeted people. They first observe and communicate with these people, then identify the problems and satisfy those people's needs accordingly. In ENGG 2900B, students went outside the campus to talk with the elderly scavengers who collected cans and cardboard on the streets using trolleys. Through walking alongside the elderly to experience the challenges and hardship of collecting salable junk, students can recognize these elderly's needs so that they can effectively design an innovative and custom-made trolley for their end users. To help hearing-impaired children speak and communicate clearly with other people, students of ENGG 2900C applied their computer knowledge to develop mobile Apps for these children to learn how to pronounce Chinese words precisely. Also, in ENGG 2900D, students not only taught children and teenagers from primary and secondary schools to make robots but also assisted in organizing an underwater robot competition for these youngsters, with the aim to arouse their interest in science and technology.

Based on the overall evaluation of these courses, over 80% of the respondents agreed that the service learning courses helped them understand more about the needs of the community and increased their interest in making contributions to the community. About 88% replied that they would apply their expertise to help the needy in future and self-improve to provide the best approach to satisfy the community's needs as necessary. Also, in the participant feedback survey of the underwater robot competition, 75% of the responding schools are interested in joining the next competition. Also, the kids who joined the competition sent thank-you cards and photo albums to appreciate the students who taught them how to make robots.

Compared with the Peer Mentoring Program, service learning courses seem to help students understand and focus more precisely on satisfying the people's needs as the needs of targeted people are well defined and the ways to satisfy the needs are specified. Thus, service learning courses involving the application of technologies to satisfy the needs of targeted people is a good way to teach Service Leadership. To allow students to have more autonomy for applying their expertise to satisfy the needs of people, a program is set up to encourage students to initiate their own service projects. Students submit their proposals to the corresponding professors, and once approved, they can do their projects in an engineering design laboratory under supervision.

Impact of the Project

Traditionally, leadership development has not been the main focus in engineering education or a priority for engineering students [3-5]. These students have tended to concentrate their time on technical courses and group projects. With the implementation of the HKUST Service Leadership Initiative, engineering students are becoming aware of the dominance of services in our economy and the importance of leadership skills for their future development. The Initiative is also fostering a bonding between junior and senior students through the Peer Mentoring Program. This cohesion further extends within each engineering department, and graduates return voluntarily to HKUST to participate in school events, promoting their corresponding departments and the skillset necessary for professional practice.

With the influence of Service Leadership, more students put the factor of satisfying people's needs in designing their final year and capstone design projects. For example, one student project is the development of a Kinect-based physiotherapy system for patients who cannot go to clinics frequently for treatment. This project was also nominated and awarded in some public competitions. The University actively encourages more and more students to apply their knowledge and skills to make contributions to the community.

From the experience at HKUST, just three years ago, most students had little idea about Service Leadership. After the introduction of this ongoing initiative, students can apply Service Leadership in their projects, and we believe the outcomes of the project will continue to positively influence both students and HKUST.

CONCLUSION

With the aid of the Foundation and HKI-SLAM, HKUST has successfully established a Learning Community to help students develop a mindset of Service Leadership. They can achieve different levels of learning at the corresponding platforms based on their interests. After years of nurturing, each platform has achieved its purpose and provided insights for further developing the Community:

- The leadership area and *EnG Chitchat* act as an initiator to raise students' awareness on Service Leadership. The *EnG Chitchat* is also a good means to collect what students need and like so that tailor-made workshops can be developed to inspire students to learn Service Leadership.
- Peer Mentoring Program is a straightforward and handy way for students to practice Service Leadership. More training on need identification and satisfaction should be provided to help peer mentors effectively satisfy the needs of the first-year students.
- With the well-defined approaches to satisfy the needs of the targeted people, service learning courses are effective in helping students develop as Service Leaders. These courses produce profound impacts on both students and service receivers. In addition, an engineering design laboratory is set up to encourage students to start their own projects in which they can apply their expertise to help the people in need.
- More research about the comparison of the technology-based service learning course/workshop with the Peer Mentoring Program will be conducted to determine which one would be more effective in teaching certain core beliefs of Service Leadership.

ACKNOWLEDGMENTS

We would like to thank the Victor and William Fung Foundation and the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) for their support on the establishment of the Service Leadership Community at HKUST. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

Chapter 115

**CHALLENGES IN THE DEVELOPMENT
OF AN EXPERIMENTAL COURSE SERIES
FOR MULTI-DISCIPLINARY
UNDERGRADUATE STUDENTS**

***Kam Tim Woo*, PhD, Sau Man Yuen,

Center for Global and Community Engagement,
School of Engineering, The Hong Kong University of Science
and Technology, Kowloon, Hong Kong, PR China

ABSTRACT

The Hong Kong University of Science and Technology (HKUST) aims to engage undergraduate students in making contributions to the community as well as create and facilitate educational and leadership opportunities. Undergraduate students are encouraged to utilize their engineering knowledge and technology knowhow innovatively in projects contributing to the society. We collaborate with the School of Business, School of Science and faculty from School of Humanity and Social Science, and Interdisciplinary Program Office to design an undergraduate courses series to embed engineering knowledge and service leadership into two experiential learning programs.

INTRODUCTION

The objective of the experimental course is to provide students with opportunities to understand the fun of Inclusion, Science, Technology, Engineering, Art, and Mathematics (ISTEAM), and to nurture social inclusion and develop an understanding of the talents and needs of contestants from different backgrounds [1]. By integrating experience in service

* Corresponding Author's Email: etim@ust.hk.

leadership into community engagement projects with fun and learning (an experiential learning approach), we provide a different learning environment to the undergraduate students.

The key design elements allow students to learn various types of knowledge from different professionals. These can be achieved by putting multi-disciplinary students together and forming teams to complete a goal. The students learn from their peers and understand different clients' views. The courses also aim to provide students experience in integrating their professional knowledge into community services. They can convert what they learn in the university and help to make changes to the society.

In the meantime, the courses allow students to make a decision when they face challenges from the clients. The clients in these courses are children, youth, students with special education needs and ethnic minorities. Our students need to understand and communicate with clients. As the author of the article "Inclusive education" [2] mentioned, people have gotten used to special education to mean "separate education." We believe that there will be a positive outcome for both academic and social interactions when the clients participate and educate each other.

Both courses receive support from departmental level to joint-school level in order to achieve multi-disciplinary problem-based learning. With the support from the other units like NGOs or engineering units, the students which participated in the course will have greater chance to learn and handle real-world problems by using their knowledge. Experiential learning encourages them to combine technical knowledge and skills with the creativity that leads to innovative ideas [1].

EXPERIMENTAL COURSE

In order to encourage multi-disciplinary learning and society collaboration, a mobile app design project has been embedded into an experimental learning course in 2015 [3]. This course has been set up for students coming from different disciplines such as engineering, business and science. They learn how to design Articulation Screening and Training Tool, a mobile app and server system for hearing impaired children. The students worked in sub-teams in different areas like mobile app design, data server construction and UI design. They also had to organize service learning activities in collecting speech samples.

The course is a good example in demonstrating the collaboration between NGO and academic research into a mobile app. The training tool can provide a simple platform for hearing impaired children to learn phonemes in a fun way. The course offers interactive modules that are different from conventional lecture-based engineering courses.

Two groups of undergraduate students were responsible for developing the apps for voice recording and the system. The junior undergraduate students developed the voice recording system, and the senior undergraduate students developed the system and the UI design. We also invited postgraduate students and research faculty to help develop the voice recognition algorithms. There were also a group of multi-disciplinary students and primary/secondary students that helped in voice collection among secondary students.

Over 8,000 voice samples were collected by HKSOD in summer 2015 and more than 35 enthusiastic students from a local secondary school helped with the voice sample collection

by HKUST in November 2015. There were around 50 HKUST students helping to verify over 25,000 Cantonese voice samples.

Another course is the Underwater Robot Community Engagement Project [4]. In 2015 March, HKUST invited students from Primary Four to Form Three to take part in a social inclusion project. Underwater robot technology was adapted for use in this social inclusion project. The HKUST Centre for Global and Community Engagement (GCE) offered an UG course with other units and recruited UG students for a two-and-half-day workshop for 18 school teams in robot-making skills. Through the course, the UG students were transformed from apprentices to mentors. Then, UG students became the mentors of contestants participating in an Underwater Robot Competition. The competition was held in HKUST indoor swimming pool.

The objective of the workshop and the competition was to provide students with opportunities to learn and experience in the Inclusion, Science, Technology, Engineering, Art, and Mathematics (ISTEAM) [5] and to nurture social inclusion and develop an understanding of the values and needs of students with different abilities and backgrounds. The contestants needed to design and assemble their robots, including both electronic and mechanical components on their own. The contest's aim is to spark junior students' interest in science and mathematics and it also gave the university students a chance to serve the community. Undergraduate students provided valuable lessons about teamwork for the contestants. It was really a pleasure to use engineering knowledge to serve the society.

In 2015 March, HKUST invited students from Primary Four to Secondary Three to take part in the competition. In the project, the contestants were coming from mainstream primary and secondary schools, and schools that teach students with special education needs and ethnic minorities. The students with special education needs included hearing impaired, visually impaired and students with learning disabilities. The HKUST students who took part in the course conducted a two-and-half-day workshop for all the 18 teams to teach them how to build a basic underwater robot. After the workshop, the underwater robot competition was held in HKUST indoor swimming pool and the student teams were required to improve their robot design by adding different parts and manipulators. To ensure the fairness, there was no fine adjustment for the scores even when the team consisted of students with different learning abilities.

FEEDBACK FROM THE STUDENTS

The reflective reports of UG students in these two courses indicated that they had a great experience in the teamwork in a multidisciplinary group. Here are some of the feedbacks from the undergraduate students and the secondary school participants:

"I used to be a person that works randomly, but now I would choose to make the work perfect so as to create a sweaty but worthwhile memory," said one of the HKUST undergraduate student mentors. A HKUST final year undergraduate business student mentor stated, "This is the first experience in working together with engineering and science students in a team."

The events also provided a chance to help the participant to gain confidence and engineering knowledge. One of the participants of the Underwater Robot Competition 2015 mentioned, “I am visually-impaired but it doesn’t mean I can’t do it.”

The Mobile App Design project and the Underwater Robot Community Engagement Project is the first trail of an undergraduate course in implementing “ISTEAM” education in HKUST. A lot of positive feedbacks were received. Also, many ways to improve the courses were also found. Many of the secondary and tertiary schools showed their passion for helping and willingness to have further cooperation in other experiential learning community projects. Our team was really pleased to see the concept of using engineering knowledge to serve the society in action and to see people of different backgrounds working together to bring a difference to society.

ABSTRACT

We conducted semi-structured, qualitative interviews with 17 Hong Kong based middle to senior managers from diverse service sectors about their own service leadership practices in helping their respective organizations to maintain effectiveness through establishing and meeting the needs of service-recipients and end-beneficiaries. Based on their explanations and illustrations, we identified four common practices. These were: entrepreneurial spirit and mindset, distributed leadership, building and sustaining productive relationships with stakeholders as strategic partners, and caring and respectful disposition. These practices and practical examples can inform the curriculum for undergraduate students in Hong Kong.

INTRODUCTION

Advanced economies have entered a post-industrial era, with factory-based mass-production of standardized goods in decline, superseded by knowledge-intensive manufacturing wrapped in service [1], or by ‘pure’ service, tailored or adjusted to the unique needs of particular service recipients [2].

The leadership paradigm associated with the factory mode assumed that business operations require centralized, top-down command, imposition and enforcement, exerted by an elite few. While this leadership paradigm may linger on in the popular imagination, there have been calls for organizations to embrace a new leadership paradigm, better-suited for contemporary modes of value-creation [3].

Service leadership has been proposed as a new leadership paradigm for advanced economies [4]. Service leadership involves influencing people in positive ways, in accordance with sound ethical principles and in the context of employee empowerment, in order to achieve and improve upon excellent service. An associated organizing principle is that leadership responsibilities are distributed widely [5, 6], with organization members at all levels shouldering responsibility and taking initiative [7]. Associated core beliefs include that everyone is or can be a leader [8], that service quality depends on the quality of the server [9], and that caring disposition is an essential service leadership attribute [10, 11]. Servant leadership [12-15] may be regarded as a constituent of service leadership, but in service leadership there is additional concern to meet the leader’s own needs for health in body, mind and spirit [16].

The service leadership paradigm assumes that the effectiveness of human service organizations requires everyone, whether located at the frontline or responsible for designing the service habitat, to be sufficiently developed in terms of cognitive competence, emotional intelligence, spirituality, interpersonal skills, moral character, caring disposition, self-leadership and continuous self-improvement, and self-reflection [16]. These target developmental domains challenge contemporary educational institutions to provide effective service leadership education. We assumed that credible and inspirational case exemplars and practical explanations of service leadership would be cornerstones of such education. Our research sought to add to the existing body of local case material [17], while also identifying and explaining the associated dimensions of practice.

INTERVIEWS AND ANALYSIS

We constructed an interview guide, comprising open-ended questions on the following themes: organizational background; the interviewee’s approach to problem solving, meeting service-recipients’ needs, service innovation, influencing people, and developing people; sources of influence on the interviewee’s leadership approaches; how the interviewee had developed as a service leader; the interviewee’s motivation to provide service leadership; the interviewee’s recommendations on how to identify and meet service recipient needs; and organizational arrangements to support service leadership. Probing questions were included throughout the interview in order to seek critical incident accounts [18-20] as illustrations.

Based on the interview guide, semi-structured interviews [21] were conducted in Cantonese on a one-to-one basis with 17 Hong Kong based managers, who were occupying positions of seniority, ranging from project manager up to CEO. Among the interviewees, seven were employed by large multinational corporations, seven worked for local small businesses, one was a government employee, and two worked for NGOs. All interviewees were known by the authors to be seasoned practitioners of service leadership, and were contacted through the authors' personal networks, and hence constituted a criterion-based convenience sample [see 22, p. 28], covering a wide range of service industries.

Table 1. Background of the interviewees

Code Name	Position	Industry Sector
M1	CEO	Food
M2	CEO	IT/Marketing communications
F1	CEO	Education
M3	Executive director	Travel
M4	Managing director	Finance
M5	Managing director	Logistics
M6	General manager	Hospitality
F2	General secretary	NGO
F3	School principal	Education
M7	Director	Engineering services
F4	Vice president	Logistics
F5	Vice president	Logistics
M8	Senior unit manager	Insurance
M9	Senior unit manager	Insurance
M10	Training consultant	Management consultancy
M11	Design consultant	Engineering services
F6	Project manager	Travel

Table 1 lists the interviewees by codename, position, and industry sector. Each interview was transcribed on a near-verbatim basis into English.

Adopting a grounded theory approach [23, 24], the third author conducted open coding on the transcripts of the first six interviews, initially identifying over 100 categories and then, through axial coding, distilling these into 22 practice concepts. She was then able, without forcing, to categorize raw data from the transcripts of the remaining 11 interviews into these 22 practice concepts. These were: social values; personal values; seeing the big picture, looking forward; solving problems; using new approaches, taking risks, being flexible, being open; being persistent, hardworking, and conscientious; being customer-oriented; delegating, empowering, and developing subordinates, sharing responsibilities; connecting, relating, and integrating; collaborating and establishing partnerships; caring and respecting; learning new things and keeping updated; accepting mistakes; adjusting and improving; recognizing service leadership; professional knowledge and conduct; handling stress and managing emotions; setting a good leadership example; communication and interpersonal skills; providing training and giving guidance; recruiting and retaining the right people; and company support. Having identified these 22 practice concepts, the third author re-examined all 17 transcripts for instances and counted-up mentions thereof, arriving at four over-arching sets of service

leadership practices. A separate, more holistic reading of the 17 transcripts by the second author yielded a similar set of over-arching service leadership practices, thereby providing confirmation through analyst triangulation [25].

WHAT WE FOUND

The four main sets of service leadership practices were: entrepreneurial spirit and mindset; distributed leadership; building and sustaining productive relationships with stakeholders as strategic partners; and manifesting a caring and respectful disposition. Next, we shall explain these practices.

Entrepreneurial Spirit and Mindset

This involved leading for service innovation, embracing new approaches, taking risks, and being flexible and open-minded. All 17 interviewees mentioned aspects thereof. Service innovation could unfold along a continuum ranging from radical through connective to incremental innovation. Radical, “breakthrough” or “frontier” innovation involved reconfiguration of the firm’s business model. For example:

“I’m starting at this point to think about how to reintegrate all online sales, online services plus selling of offline shops or some true services we have to do when offline, like face to face service, to become a new model. And this is the new model that we, ‘---- Company’ wish to implement in the next one or two years.” (M2)

Connective innovation entailed the creation of novel service items to address needs that were newly-articulated by existing customers, while incremental innovation involved improvising upon existing service items to meet service recipients’ needs. Alluding indirectly to the latter, one interviewee commented:

“When you provide a professional service, being professional is not following what the books say, as it’s more like enforceability... the ability to do something beyond the codes and practice... this enables the company to have different skill sets to sell. Also, these skill sets are very unique, making our company different from other companies...” (M7)

Distributed Leadership

This involved delegating tasks to others for the twin purposes of mutual empowerment and service effectiveness. Every interviewee mentioned aspects thereof, which could range from “hands-off” empowerment within a flexible organization structure to “hands-on” guidance within a more settled structure. An example of “hands-off” empowerment was the adoption by all members of one organization of a system of using business cards with no job titles, representing a flat and flexible organization with no hierarchy, and with members being trusted to develop their own areas of expertise and responsibility in response to customer needs:

“Our company also does not officially define who is what. Actually, we call all employees that ‘Bro’ or that ‘Sis’. We don’t have titles. Even when we went out and did business with --- (a large international company), the business cards did not have titles. They looked at our cards. Then, we ... told them, ‘Oh. It’s fine. I’m responsible for this case. I can arrange it.’” (M1)

“Hands-on” guidance involved conveying basic principles to followers and nurturing them, though mentoring or coaching, to become independent solvers of the problems or needs of their service recipients, and was a step toward “hands-off” empowerment. The latter is illustrated in the following quote:

“A lot of ideas ... aren’t mine... it is the people from the floor (who) ... give them to me. ... For example, we have scan machines. How we continue to improve our scanners (comes from) the feedback from the people in the frontline. It is not from me. Because they do it day and night. They are in the best position to give me the most precious advice...” (M5)

Building and Sustaining Productive Relationships

All but one of the interviewees mentioned aspects of this set of practices, which included establishing and maintaining connection and dialogue with stakeholders, oriented to the diagnosis of service recipient needs. Such dialogue could take place via electronic media as well as face-to-face contact, and could be ongoing or extensive. For example:

“The first time I met this customer I already knew much information about her and understood her needs. ... Now, if she has any needs she will send WhatsApp messages to me.... Actually I don’t treat her only as a customer. I treat her as a friend. We were like old friends when we first met...” (M9)

Many interviewees mentioned the importance of being approachable and of inviting or initiating ongoing communication with service recipients. For example:

“After you get along with them for a long time, you will naturally become able to talk with them. Also, you will pay effort (to talk). You will think that it is unreasonable to fail to talk with them. Then, over time, you can communicate with them more effectively.” (F3)

Interviewees also mentioned the importance of open communication with subordinates. The following comment expressed the need to respect subordinates’ concerns about service requirements, the need to ensure that subordinates had sufficient resources to address such requirements, and the need to make corresponding adjustments in organizational policies.

“I will treat my role as a leader rather an administrator. That means, I think about the direction of the institution’s development, aligning with the different expectations of colleagues, and making it easier for them to achieve success in their jobs and to be happy.” (F3)

In cases where service recipients knew what they wanted and needed, the principle of strategic partnership required service leaders to be proactive and responsive in meeting articulated needs, to seek comments and feedback for service improvement, and to go beyond what was being asked for. For example:

“They ask you questions in the morning and want the answers in the afternoon.... Or sometimes they want the answer right away. To help our clients, instead of simply conveying the question to the related parties... we

need to think about and ask some further related questions so that we can synthesize the entire picture for the clients.” (F6)

In cases where service recipients were unsure about their needs, or were demanding inappropriate solutions, service leaders were careful to show that they were committed to meeting genuine needs while building around service recipients’ ideas. For example:

“There are things clients really need, but in many cases they don’t really need to have something but just think it’s good to have it. This is hard to directly ask them about. Especially, clients will search for information through various means, like the internet... So you will have to think how to explain this issue to the client...” (M7)

Caring and Respectful Disposition

This reflected that service leaders cared deeply about the best interests of their followers, customers and end-beneficiaries. Every interviewee mentioned related aspects, expressing passion for and enjoyment of their work, in the face of difficulties and demands. While some service leaders wanted to contribute to wider social causes, of primary and general importance was that they expressed heartfelt desire in their work to meet the needs of those around them as an end in itself. Interviewees articulated this in various ways, for example:

“Love is not just a matter of using the mouth to say it. You have to undertake. Yes.” (F3)

“Thus, it’s people... that are our biggest asset. I think it’s so ... We respect every customer. And (we) have a lot of trust in them...” (F4)

“When they (employees) bring their kids to the office, I hug the kids. Whoever brings their kids here and wants me to hug them, I hug them...” (F2)

Caring and respectful disposition appeared to constitute an essential foundation for service leadership, upon which all the other practices were built. One interviewee said that he tried to convey this principle to his subordinates:

“I advise them to be sincere in caring about people. In our job it isn’t really about caring about the finance. It’s about the person. Then, with this purpose, they (employees) may have greater enthusiasm at work, motivation to push themselves forward and to be mature. This is an important thing. True caring is the prerequisite of progression. True caring is more important than skills and luck.” (M9)

DISCUSSION

In identifying illustrative case exemplars of four key service leadership practices, we have adopted grounded theory [23, 24], and have explained and illustrated how service leaders meet their own needs by expressing entrepreneurial spirit and mindset, arranging for distributed leadership, building and sustaining productive relationships, and providing caring and respectful service from the heart. Appreciating and practicing service leadership may be an antidote to despair and anomie [26]. Our case exemplars can be shared with students as guidance and inspiration for their development as future service leaders.

ABSTRACT

The full-time service-learning summer practicum programme organized by Lingnan University aims to provide internship experiences that empower undergraduates to practice service leadership in community organizations. We report on a qualitative evaluation study that identified three success factors, namely, task significance and challengingness, co-educator presence and supportiveness, and students' disposition for socially agentic self-initiation. The study broke these factors down into a number of sub-factors. We discuss the practical implications for service leadership development for undergraduates.

INTRODUCTION

Internships involve hands-on workplace engagement [1]. They can address a range of educational purposes [2, 3]. Recently, a new purpose has emerged for some types of internship, which is nurturing service leadership attributes [4]. We shall first explain the concept of service leadership, and then summarize some factors that the broader literature on internships suggests might, by implication, also foster service leadership development through service-learning internships or practicums.

Service leadership is both an organizational process and a developmental domain. As an organizational process, it is a pro-socially-oriented, non-hierarchical and dispersed approach to leadership [5], with organization members from the front-line upwards sharing responsibility for service design and delivery [6]. In high-quality service organizations, senior service leaders develop open systems and cultivate a shared vision and spirit, inspiring leadership at the front-line and up to develop and sustain excellent service [6, 7]. Individual-level service leadership attributes and practices include active listening, anticipating and solving problems, caring disposition, originality in expressing opinions, building cohesive relationships, striving for service improvement, honouring promises and commitments, pro-community orientation, influencing others, and project coordination [8].

Although little prior research has been conducted on internships specifically intended for service leadership development, we inferred from prior literature that three factors would likely foster service leadership attributes, if they were present in service-learning practicums. The first inferred factor was the opportunity for students to create original solutions that address real needs [2]. The second inferred factor was co-educator supportiveness, which involves the provision of on-site coaching, guidance, encouragement, and support to students by their workplace supervisor(s) [1], as well as more basic orientation to the workplace and to task requirements [9, 10]. The third inferred factor was the student's level of developmental maturity [11], including his or her predisposition for active learning [1] and growth mindset [4, 12].

OUR STUDY

Our research focused on practicums undertaken between May and August 2014 by 16 students from Lingnan University (LU). Students worked full time for eight weeks at their respective community organizations, of which there were 10. These practicums differed from service leadership internships organized by The University of Hong Kong [4] in three respects. First, they were extra-curricular, not credit-bearing, and were not subsumed under students' major programmes. Second, they involved a portfolio of tasks, guided by a 'mini-mission', rather than being entirely focused on one project. Third, while the Office of Service-Learning (OSL) at LU intended that all practicum students would have abundant opportunities to perform work in collaboration with others, each had his or her own mini-mission and task portfolio. Thus, even though at some of the sites there were two practicum students from LU, and/or interns from other universities, the LU practicums were assigned individually rather than to project teams.

Our research questions (RQs) sought to identify success factors for service leader development through the practicums. Our first RQ was: what success factors relate to the type of tasks that the practicum students are empowered to undertake? Our second RQ was: what success factors relate to the student himself or herself? Our third RQ was: what success factors relate to the partner organization representatives (PORs) or to designated workplace supervisors?

Since the RQs were open-ended, focusing on issues that included organizational and socio-emotional dynamics, and addressing the relatively new topic of service leadership development through practicums in community organizations, we adopted a phenomenological approach [13]. The second author conducted semi-structured interviews with all 16 participating students, with PORs from all 10 host sites, and with a senior field coordinator from OSL, who had set up the practicums. The first and second authors analyzed the interview transcripts, and conducted documentary analyses of the learning diaries and reflective reports that students submitted as practicum requirements, along with PORs' formal appraisal reports on nine of the students.

Besides adopting a phenomenological approach, we also adopted a multiple case study research design [14]. In table 1, codenames 1-10 in column 1 denote the practicum sites, codenames 1a-10b in column 2 denote the PORs, and codenames M1-4 and F1-12 in column 3 denote the male and female practicum students, respectively. Ratings in columns 4-7 of Table 1 are interpretative syntheses based on comments by PORs, students and the senior field coordinator, and should be interpreted with caution.

FINDINGS

Through the research, we identified three broad success factors. These bore some correspondence to the factors, described above, that we had anticipated on the basis of the literature on internships, although our research led to their refinement and redefinition. We shall next explain and illustrate the success factors, before going on to summarize the overall effectiveness of the practicums and our suggested measures for improvement.

Task Significance/Challengingness

The first success factor concerns the significance and challengingness of the practicum tasks. It involves three sub-factors regarding the contributions that practicum students are empowered to make. The first sub-factor is that the students should perform work that conveys to them and others a palpable sense that they are meeting real community needs. The second sub-factor is that the students should perform work that involves facing difficulties and tackling problems while shouldering responsibility for overcoming/resolving them and not merely following orders and/or set procedures. The third sub-factor is that the work involves getting things done with and through people, rather than solo clerical or technical tasks.

Table 1. Sources of data and a summary of the findings

Practicum sites and type of service unit	Informants		Presence of Success Factors			Effectiveness in terms of leadership contributions and development
	POR code-names	Students code-names, gender, year & major	Task significance/challengingness	Co-educator presence & supportive-ness	Student's disposition for socially agentic self-initiation	
Site 1: Elderly education	1a 1b	F1 Yr 2, Soc Sci	High	High	High	Excellent
		F2 Yr 2, Soc Sci	High	High	Mod to high	Excellent
Site 2: Food collection & distribution	2a	M1 Yr 2, Soc Sci	Mod to high	Mod	High	Excellent
		F3 Yr 1, Trans	Mod to high	Mod	Initially low	Satisfactory
Site 3: Univ. service learning	3a 3b	F4 Yr 2, Phil	High	Mod	High	Excellent
		M2 Yr 2, Trans	High	Mod	Mod	Good
		F5 Yr 2, Trans	Low	Low	Low	Unsatisfactory
		F6 Yr 2, Soc Sci	Mod	Mod	Low to mod	Satisfactory
Site 5: Elderly recreation	5a	F7 Yr 2, Soc Sci	Mod	Mod	Mod	Satisfactory
		F8 Yr 2, Soc Sci	Low to mod	Low to mod	Low to mod	Unsatisfactory
Site 6: Clothes recycling	6a	M3 Yr 2, Cult St	Low to mod	Low to mod	Low to mod	Unsatisfactory
		F9 Yr 2, Soc Sci	Mod	High	High	Satisfactory
Site 7: Social enterprise corporate services	7a	F10 Yr 2, Mkt	Mod to high	High	Mod to high	Good
		F11 Yr 2, Soc Sci	Low	Low	Mod	Unsatisfactory
Site 8: Language education	8a 8b	M4 Yr 2, Soc Sci	Mod	High	Mod	Good
		F12 Yr 2, English	Mod to high	Mod	Mod to high	Good
Site 9: Rehabilitation/outdoor development	9a 9b					
Site 10: Refugee advocacy	10a 10b					

This success factor was illustrated at site 1, where the duties of F1 and F2 included designing classes on information technology and delivering them to elderly people, and conducting promotional visits about the classes. Rather than following pre-ordained protocols, F1 and F2 had opportunities to plan original solutions and improvise them in real time during service encounters. Illustrative quotes included the following:

“You can tell young people directly to type text on the monitor, but for elderly people, I discovered that you need to indicate first the place for typing the text.” (F1)

“Some elderly people said, ‘I am too old to learn’... To encourage them, I shared success stories of other elderly people, who hadn’t known anything about smartphones and finally learned how to use them to meet their needs.... I encouraged them to try.” (F2)

“(F1 and F2) were responsible for developing content and designing the teaching process all by themselves. They also prepared effective learning materials. They performed well.” (POR1a)

It appeared, however, that some PORs used students merely as ‘hired hands’ to perform routine technical or clerical tasks. The following quotes came from site 4:

“We expected a student to help with some light tasks.... She (F5) did not have much opportunity to perform service leadership here.” (POR 4a)

“For two weeks, my main task was ... simple but extremely time-consuming. It was very boring.” (F5)

Co-Educator Presence and Supportiveness

The second success factor concerns co-educator presence and supportiveness. It involves three sub-factors regarding the contributions of PORs or designated staff members responsible for providing on-site supervision. The first sub-factor is that the POR or designated supervisor should provide orientation at commencement of the practicum and before the practicum student’s assumption of new duties. The second sub-factor is that the POR or designated supervisor is available for *ad hoc* discussions about emerging issues. The third sub-factor is that the POR or designated supervisor should provide regular guidance, coaching and constructive feedback to the practicum student. This broad success factor was illustrated at site 7, where the approachability, guidance and support provided by POR 7a and other supervisors were appreciated by students F9 and F10. For example:

“From the beginning, they (POR 7a and other supervisors) provided us with something to read, to know more about the whole institution.... (POR7a) would come out of his office and would ask about our work and progress.... We were happy with him and he was willing to talk with us. We were free to voice out our opinions and he was also willing to listen.... He would also have casual talks with us. ... He would teach us how to do a proposal and even our reflective diaries.” (F9)

“(POR 7a and other supervisors) would point out our mistakes when we did something wrong..., but they would not use a complaining tone, and rather they would nicely tell us that, ‘Next time, when you want to ..., you can...’.” (F10)

Some PORs neither provided this kind of support nor arranged for another supervisor to provide it. Such omissions arose for various reasons, such as vacations, location elsewhere, or failure to appreciate the need. For example, at site 8, it appeared that POR 8a was a distant figure for the student, F11, and that supervision by POR 8b was perfunctory.

“(POR 8a) wouldn’t look after the operations of this company. (POR 8b) was my supervisor who introduced me to the office environment, who gave me an orientation and allocated tasks to me.” (F11)

“I told her (F11) that she is alone and is experiencing the real-life work environment. She may feel bored but it is the real-life environment and it would be good for her to learn about this sooner rather than later.... I was always away from the office ... I noted that someone had to take up the coaching role. But who? What to teach? ... When (F11) left, I told her that I was afraid that I couldn’t give what she wanted.... But interns also need to learn that in the real-life work environment, not everyone likes to be interrupted for questions when busy with work.” (POR 8b)

Disposition for Socially Agentic Self-Initiation

The third success factor concerns students’ disposition for socially agentic self-initiation during the practicum. It involves four sub-factors. The first sub-factor is that the student should be willing to initiate activities or proposals, rather than waiting passively for instructions. The second sub-factor is that the student should be prepared to “step out of the comfort zone” to face challenges. The third sub-factor is that the student should be proactive in building relationships with co-workers and service recipients. The fourth sub-factor is that the student should be oriented to getting things done with and through other people rather than burying themselves in solo clerical or technical tasks.

Contrasting student experiences at site 2 were attributable to differences between M1 and F3 in terms of this broad success factor, as illustrated in the following quotes:

“Without guidance, I handled contingencies and made decisions.... I was given opportunities for decisions about service provision. Although I encountered problems, I could handle them.” (M1)

“I dared not make decisions by myself, so I needed to wait to talk to [POR 2] for decisions.” (F3)

“(M1) demonstrated leadership qualities, such as coordination capacity, and responding to contingencies. ... He took initiative in expressing observations, thoughts and even things he was in doubt about.... (F3) may need some more time to understand the operations of the social service sector. She needs to understand people-orientated services.” (POR 2)

Overall Assessment

As listed in column 7 of Table 1, our effectiveness ratings, impressionistic as they are, indicate that of the 16 placements, 8 were “excellent” or “good”, 4 were “satisfactory”, and 4 were “unsatisfactory”. The unsatisfactory practicums were at case sites 4, 6, and 8, where we rated all three success factors as either “low” or “low to moderate” (see columns 4-6 of Table 1). The potential benefits arising from the co-presence of the three success factors are illustrated from the following quotes, regarding site 1:

“There was an obvious change in the atmosphere when they (the students) came.... Their lively presence affected the reactions of the elderly participants who were motivated to learn more positively and enthusiastically.” (POR 1a)

“I observed that the interns affected their colleagues. The colleagues had more communications and laughter. The work atmosphere was greatly affected.” (POR 1b)

DISCUSSION

Our research has indicated the need to make improvements in programme management to ensure that the three broad success factors are applied to each and every practicum.

Ensuring task significance and challengingness requires establishing a clear understanding with all PORs that they or a designated workplace supervisor should empower the practicum student(s) assigned to their organization to undertake tasks and mini missions that involve diagnosing and/or addressing significant needs. Furthermore, PORs need to be briefed that the practicum students should be entrusted to shoulder responsibility for tasks with sufficient complexity, and which engage service leadership attributes in working with and through other people. LU is continuing to seek third party sponsorship for the student stipends, in order to reinforce the message that the practicum programme is intended to empower students to practice service leadership for the greater good, and that they are not just “pairs of hands.”

Ensuring co-educator presence and supportiveness requires making clear to PORs that they and/or a designated workplace supervisor should serve as supportive co-educators. Thus, we expect that PORs or designated supervisors should provide orientation and background training at commencement of the practicum, and throughout, as necessary. We expect that PORs or designated supervisors; are available for *ad hoc* discussions with their practicum student(s) about emerging issues, and that they should provide timely guidance, coaching, encouragement and constructive feedback.

Ensuring that students enter into the practicum experience with sufficient disposition for socially agentic self-initiation requires more rigor and selectivity in recruiting them. Although everyone is a potential service leader, opportunities to undertake this kind of internship or practicum are relatively scarce, and some students may not (yet) be ready. It is important to target students, who are willing to initiate, are ready to face uncertainties and challenges, are sufficiently outgoing, and who ‘buy into’ and are interested in practicing the new model of shared and collaborative leadership for service rather than the traditional industrial model of autocratic bosses and meek, obedient, dependent subordinates.

ACKNOWLEDGMENTS

The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

ABSTRACT

In this chapter we investigate the outcomes of credit-bearing service leadership education at The Hong Kong Polytechnic University via pretest-posttest design. A total of 316 participating students completed an Objective Outcome Evaluation Questionnaire at the beginning and the end of the course "Service Leadership" measuring their positive youth development qualities, service leadership qualities and beliefs, as well as life satisfaction. Mixed ANOVA analyses comparing pretest and posttest revealed that students made improvements on all the variables of positive youth development, service leadership, and life satisfaction after taking the course. The positive changes did not vary across subject mode (2-credit-bearing vs. 3-credit-bearing). However, gender differences

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

were found in which males but not females showed positive changes on positive identity, general positive youth development qualities, life satisfaction, self-leadership, and service leadership beliefs. The implications to further service leadership education were discussed.

INTRODUCTION

With the transformation of economic structure from manufacturing orientation (i.e., industrial mode) to service orientation (i.e., postindustrial mode), scholars, business professionals, and educational professionals are increasingly aware of the new demand of leadership qualities under the service economies [1, 2]. In fact, when conceptualizing effective leadership, “modern” leadership theories have focused on relationship, empowerment, integrity, trust, and service beyond strategic skills [3-6] instead of the inborn and elite nature of leadership. For example, transformational leadership emphasizes that leaders should act as an ethical role model and show individualized consideration toward subordinates [7]. Servant leadership advocates striving to meet the highest priority needs of others rather than personal interest [8].

As successful leadership qualities in the service economy are different from those in the industrial economy, Po Chung, the Co-founder of DHL International (Asia Pacific) [9], proposed the idea of service leadership which challenges the notion regarding leadership as a means to obtain fame and wealth. Instead, it regards leadership as a service that satisfies the needs of different parties involved. A successful leader is not only a competent person who is able to provide professional service, but also a moral person who deserves the trust from others and a caring person who is willing to satisfy others’ needs. The competence, the moral character and the caring disposition of a leader altogether determine the quality of the service and the effectiveness of one’s leadership. In this sense, a holistic development is highly needed in leadership education.

Bearing a mission to bring about a paradigm shift in people’s mindset of leadership and nurture a young generation of service leaders, Po Chung together with other academic professionals founded the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) and designed the service leadership curriculum framework (i.e., SLAM framework). With the sponsorship of Victor and William Fung Foundation, the Fung Service Leadership Initiative was implemented in the eight UGC-funded institutions of Hong Kong, which developed and delivered service leadership education within the SLAM framework. Accordingly, The Hong Kong Polytechnic University (PolyU) has offered a credit-bearing subject for the undergraduate students since the 2013 Spring semester. Besides lecturing, this subject adopts experiential learning, reflective learning, and collaborative learning. The major goal of the current study is to examine the effectiveness of service leadership education in this credit-bearing mode. We used pretest-posttest design to understand the changes of the students who were taking the subject “Service Leadership” at PolyU. Although pretest-posttest design cannot lead to a causal conclusion, it is a typical and frequently used approach to understand the outcome of a program [10, 11].

To date, the subject “Service Leadership” was offered to two groups of students with different credits. The 2-credit-bearing subject (28 lecture hours) was offered to students under 3-year-curriculum while the 3-credit-bearing subject (39 lecture hours) was offered to

students under 4-year-curriculum. Three differences between these two subjects are noted. First, the 3-credit-bearing subject incorporates English Reading (ER) and Writing (EW) requirement, which is a language component of General Undergraduate Requirement (GUR) of PolyU, and thus the English requirement of the home assignment is higher than that of the 2-credit-bearing subject. Second, with more lecture hours, the 3-credit-bearing subject introduces other modern leadership theories (e.g., transformational leadership, servant leadership, and spiritual leadership), which is missing in the 2-credit-bearing subject. Finally, the 3-credit-bearing subject encourages students to critically appraise the model of service leadership, and thus, students could discuss the advantages and disadvantages of service leadership. Due to these differences, we were interested in whether the program difference would influence the pretest-posttest changes. Finally, as few previous studies found a gender difference in the effectiveness of leadership program and there were equivocal findings [12-14], we also explored whether male and female students showed different patterns of changes after taking the same subject.

OUR STUDY

Among 366 students taking the subject, 348 students took the pretest while 331 students took the posttest. In total, 318 students completed both the pretest and the posttest, in which 156 students were from the 2-credit subject (male = 66; female = 90; Mean age = 21.22 years, SD = 1.54) and 162 students were from the 3-credit subject (male = 66; female = 93; Mean age = 19.77 years, SD = 1.41). On average, the former was older than the latter, $t(315) = 8.75$, $p < .001$. Students provided individual informed consent before the pretest. The pretest was conducted on or before the third lecture; the posttest was conducted on or after the last third lecture.

Measures

The objective outcome evaluation questionnaire measured three aspects of students (i.e., positive youth development, life satisfaction, and service leadership) in a 6-point Likert scale. First, 10 positive youth development attributes were assessed using items selected and revised from the Chinese Positive Youth Development Scale [15]. Three composite scores were used in this study. Cognitive-behavioral competencies include the subscales of cognitive competence, self-determination, and behavioral competence; positive identity includes the subscales of belief in the future and clear and positive identity; general positive youth development qualities include the subscales of emotional competence, social competence, moral competence, resilience, and spirituality. The reliabilities of these three composite scales were good (see Table 1).

Second, life satisfaction was assessed by the five-item Satisfaction with Life Scale [16]. This scale was successfully used previously in other Chinese samples [17] and internally consistent in the current sample (see Table 1).

Finally, a new scale was created for this subject to measure service leadership qualities and beliefs according to the SLAM framework [18]. Service leadership qualities were

measured by self-leadership, caring disposition and character strength, and service leadership beliefs refer to the core beliefs of service leadership (e.g., “Leadership is a service for self, others, groups and the society”; “Leadership effectiveness is determined by situational task competencies, character strength and caring ability”). The reliabilities of all these scales were good (see Table 1).

FINDINGS

Several mixed ANOVA analyses were conducted to examine time (pretest versus posttest), gender (male versus female) and mode (2-credit versus 3-credit) effects on the indicators of positive youth development, life satisfaction, service leadership qualities and service leadership beliefs, respectively (see Table 2). Results showed that pretest-posttest changes were significant in all the indicators, which suggested that students changed in the positive direction after completing the subject on all indicators of positive youth development, life satisfaction, service leadership qualities and service leadership beliefs. However, no interaction effects of program and time were found, indicating that the positive changes did not vary across the old and new undergraduate curriculum. Interestingly, time interacted with gender in the domains of positive identity, general positive youth development, life satisfaction, self-leadership, and service leadership beliefs. Follow-up analyses adjusted by Bonferroni suggested that male students experienced significant changes in these indicators ($ps < .01$) while female students showed mild but insignificant trends of positive changes.

DISCUSSION

The objective of this study was to investigate the outcomes of the subject “Service Leadership” at PolyU. The pretest-posttest comparisons clearly indicate that students enhanced their positive youth development, life satisfaction, and service leadership qualities and beliefs after taking this subject. With the collective data from five classes of students, these results provide more convincing evidence than the previous study of a single class [18] about the program effectiveness. Besides, the positive results are congruent with the other evaluation studies based on subjective outcome evaluation [19], qualitative evaluation [20], focus group evaluation [21] and process evaluation [22].

In particular, students’ competencies indexed by positive youth development and self-leadership ability were improved and their character such as integrity was also enhanced. They become more caring, empathetic, and attentive to others. In addition, the subject fulfills the goal to bring about a paradigm shift in students’ mindset of leadership, as they tended to endorse service leadership beliefs to a greater extent after taking the subject. This finding is important because a leader’s practice such as decision-making and problem-solving is affected by his/her leadership beliefs [23].

Table 1. Means, standard deviations, and reliabilities of the variables

Variables	2-credit subject				3-credit subject			
	Male		Female		Male		Female	
	Reliability	Mean	SD	Mean	SD	Reliability	Mean	SD
Pretest								
1. Cognitive-behavioral competencies	.83	4.42	.56	4.55	.49	.82	4.51	.53
2. Positive identity	.82	4.46	.70	4.56	.57	.83	4.47	.62
3. General positive youth development qualities	.75	4.38	.48	4.64	.42	.75	4.39	.46
4. Life satisfaction	.84	3.97	.78	4.29	.68	.87	4.11	.80
5. Self-leadership	.79	4.47	.56	4.59	.52	.79	4.35	.56

* $p < .05$; ** $p < .01$; *** $p < .001$.

The enhancement after taking the subject was true for both students of 2-credit-bearing subject and students of 3-credit-bearing subject. Students who took the 2-credit-bearing subject were under the 3-year-curriculum, who are often regarded as more mature physically and psychological than those under the 4-year-curriculum. Our finding suggests that this subject is applicable for the students at different entry levels. Additionally, as no difference between the 28-hour subject and the 39-hour subject was found, future studies should examine the question of optimal teaching hours.

Nevertheless, it is worth noting that the enhancement was more salient among the male students than the female students, especially on positive identity, general positive youth development qualities, life satisfaction, self-leadership, and service leadership beliefs. The current findings are in line with the research findings of Dugan [13] and Dugan and Komives [24] which documented the advantages of female university students at multiple dimensions of the leadership capacities relative to male students. In sharp contrast to the traditional leadership style that requires “masculine qualities” such as authority, power, and self-assertion, the effective leadership style under service economies calls for emotion-skillfulness, cooperation, relation-orientation, empowerment, and mentoring, for which, women might have advantages [25]. Obviously, more studies should be conducted to examine how service leadership education is beneficial to students of different genders.

The present findings may have limited generalizability due to several reasons. First, without a control group, the cause-effect relationship between the subject and student change cannot be firmly established. Second, without a follow-up study, this study could not exclude the “honey moon” effect in which students’ self-evaluation was boosted right after the class but returned to the original level after a period of time [26]. Hence, longitudinal follow-up studies should be conducted. Finally, this study was only based on students’ self-report of performance, which may be different from the observant-report [27]. Obviously, teacher-report or peer-report information is needed in future studies.

ABSTRACT

The notion of service leadership has been proposed to capture the ideal leadership model in service economies. However, there has been a lack of scientific measures that can operationalize the service leadership model. We thus developed a knowledge scale to capture the essential knowledge points of service leadership model in a format of multiple-choice question. The current study reported the development and content validation of this Service Leadership Knowledge Scale with four experts. The results showed that the majority of the items were rated as relevant to, clear, and representative of service leadership model. The development of this knowledge scale helps further construct a theoretical model of service leadership.

INTRODUCTION

The service economy calls for leaders with qualities to serve others. It also calls for an updated leadership theory that can guide education, practice and research on effective leadership in the service era. This leadership theory and practice are highly important to Hong Kong, where the service economy constitutes 92.7% of the GDP [1]. Against this background, Po Chung, the co-founder of DHL International and the Chairman of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM), proposed the notion of service leadership and service leadership education (SLAM curriculum framework) to meet the demands of leadership education in the service era [2]. Po Chung believed that service leaders should provide high-quality services that meet the diverse needs of individuals, groups, communities, systems and environment [3]. He also believed that domain specific knowledge and skills, moral character and caring disposition are the bedrocks of successful service and effective service leadership [2]. Although these three qualities vary across individuals, service leadership notion upholds a belief that everyone can be a leader and has potential to improve their service leadership [4].

The content of the service leadership can be seen in two recently published special issues [4, 5]. There are several distinctive features of the service leadership model compared to other mainstream leadership models [6]. First, the model places equal importance on emotional, behavioral, cognitive, spiritual, and physical dimensions of a leader, and it has a comprehensive knowledge framework that covers service leaders' personal development, leadership practice, interaction with others and the systems with a service orientation. Second, the model emphasizes that "the server is the service" [3] by highlighting both the intrapersonal and interpersonal qualities of service leaders, with competencies, moral character and caring disposition as the fundamental qualities of successful service leaders. Third, self-leadership and reflection are critical service leadership qualities. Self-leadership includes self-management, self-reflection, intrinsic motivation to serve, goal setting and goal attainment. Service leadership is regarded as a constant reflection process for continuous improvement. Fourth, the service leadership model is applicable to multiple academic disciplines, professions in different service domains, and workers in different positions (e.g., from managers to frontline workers).

With the financial support of the Victor and William Fung Foundation, the Fung Service Leadership Initiative (FSLI) was launched in 2012 to support the development of service leadership education amongst the eight government-funded universities. As a member of the FSLI, The Hong Kong Polytechnic University (PolyU) has developed both credit-bearing courses and non-credit bearing programs on service leadership [7, 8]. In particular, multiple evaluation strategies including objective outcome evaluation, subjective outcome evaluation, and qualitative evaluation were used to evaluate the implementation and impact of the courses and programs [9]. Results generally revealed that the students showed positive changes in their service leadership qualities after joining the course or program and they generally had positive perceptions of the course and instructors. The related evaluation findings can be seen in two recent published special issues [9, 10].

While promoting service leadership education based on service leadership model is important, there is still a lack of measures to operationalize the service leadership model. In other words, how to judge if an individual is a service leader remains a question. What kind

of knowledge a service leader should have? What are the core beliefs of service leaders? What kind of behavioral qualities a service leader should demonstrate? Filling these gaps could help to further develop service leadership theory, improve service leadership education and provide guidance on the practice of service leadership. As such, The Hong Kong Polytechnic University initiated a research project entitled “Development and Validation of Measures Based on the Service Leadership Model” to develop and validate three scales on knowledge, attitude and behavior of service leadership. In this paper, we reported a study on the development of the knowledge scale on service leadership and the related content validation findings.

The purpose of developing the knowledge scale is to measure individuals’ understanding of the fundamental knowledge points that a service leader is expected to obtain, especially for those who receive service leadership education. The knowledge scale was created based on a knowledge framework of the service leadership education referring to different literature, including SLAM curriculum framework [2, 3], the “25 principles” of service leadership [11], 12 dimensions of personal brand of service leaders [12], and the lecture content of the subject “Service Leadership” [4, 5]. In details, the knowledge framework covers the following important domains of service leadership:

What is Service Leadership and What is It About?

The conceptualization of service leadership highlights service orientation [3, 6]. Service leadership is about providing high-quality services to satisfy the needs of oneself, others and systems [2]. Service leaders are the ones who could influence the subordinates with their good personal qualities instead of manipulating others or giving commands and penalties [2]. Character is more important than skills for job entrants in the service economy [3].

Service Leadership Has Three Realms: Self, Others and Systems

Service leadership can be carried out in three realms – self, others, and systems. Self-leadership takes place within individuals. Service leaders need to develop personal qualities and intrinsic motivation to serve others and systems, including improving one’s ability, skills and willingness to serve the needs of others and systems [2, 13]. Service leaders should be able to apply different motivation strategies to drive themselves to attain the goals [14-17]. Otherwise, they are not qualified to lead others. People-leadership takes place in a team environment. It is manifested in service leaders’ interaction with people and groups [2]. Systems leadership takes place in communities, including the local community, local society, and international markets. It is manifested in the control over the community and society rather than individuals. Different realms of service leadership correspond to different Chinese philosophies, with Buddhism related to self, Confucianism to others, and Taoism to systems.

Everyone Can Be a Leader

There is an important belief upheld by service leadership theory, which is “everyone can be a leader” [2, 6]. Service leadership model uses a broad definition of leadership, including leading oneself, leading people, and leading systems. Accordingly, people who are taking a leading role in any service transactions can be regarded as leaders and have the opportunity to practice and improve their leadership qualities. In addition, service leadership adopts an incremental belief about human attributes [18], and regards human attributes (including leadership) as changeable. In this tenet, service leadership qualities can be trained and improved. Therefore, everyone has the potential to be a service leader.

The General Principle of $E=MC^2$

The service leadership model proposes that leadership competencies, moral character, and caring disposition are three key attributes contributing to good service quality and effective service leadership [2]. It can be summarized as a formula $E=MC^2$, where “E” represents “effective service leadership,” “M” represents “moral character,” the two “Cs” represent “competence” and “caring disposition” [7]. Among the different elements, trust, fairness, respect, and care are considered as the “secret ingredients” to differentiate satisfactory service from unsatisfactory one [11]. Competencies, moral character, and caring disposition can enhance these “secret ingredients” so as to improve service qualities and leadership effectiveness. These three attributes are equally important for both leaders and followers in the service economy, and the attributes could be mutually influenced and improved between leaders and followers, thus raising their service leadership to a higher level.

Competencies

An effective service leader demonstrates good leadership competencies, service competencies, intrapersonal and interpersonal competencies to guide their personal development and leadership practice [19, 20]. Leadership competencies refer to possessing leadership skills and capacity that help service leaders attain personal and organizational goals, solve problems and satisfy different needs of self, others and systems. Service competencies of service leaders refer to their understanding and endeavors of creating and providing high-quality service with regards to particular contexts [2]. Moreover, intrapersonal competencies (i.e., IQ, EQ, AQ and SQ) and interpersonal competencies (e.g., conflict management, assertiveness, active listening) are core personal attributes that service leaders should continuously improve [19, 20].

Moral Character

The Service leadership model believes that professionals, elites or leaders without moral character are not true service leaders [20, 21]. Service leadership education fosters students' moral character by referring to two bodies of knowledge. The first one is about character strengths proposed by the Western researchers, which include six different domains – wisdom, courage, humanity, transcendence, temperance and justice [22, 23]. The second is about Chinese philosophies in Buddhism, Confucianism, and Taoism, particularly the Confucian virtues, such as benevolence, righteousness and propriety [24, 25]. According to the Principle of Personal Ethics of service leadership, service leaders should know how to do the right things by following moral codes and ethics. In this way, they can gain trust and respect from their followers [11].

Caring Disposition

A competent and moral service leader should also embrace caring disposition [2]. A caring service leader demonstrates sincerity to learn and meet others' needs and to show genuine care via love, empathy and active listening [26]. Caring disposition is commonly emphasized in many mainstream leadership models, such as servant leadership [6]. In the service leadership model, caring disposition covers not only the intention of caring (concern for others) but also action to care for one's followers, service clients and other people in need, which can be manifested in, for instance, developing the followers' growth [26].

Positive Social Relationship

Service leaders should be able to create, develop and maintain healthy and positive social relationships, while trust, fairness, respect, care, behavioral consistency, and loyalty are regarded as important to positive social relationships [27]. In particular, Chung and Bell [2, 11] repeatedly emphasized that trust is the key to successful service and leadership in service economy. Positive social relationships would comprise useful social capital that enables service leaders to operate their environment well [28].

Manufacturing Economy Versus Service Economy

Service leadership is connected closely to the context of the service economy, which is in sharp contrast to the manufacturing economy in economic structure, organizational structure, and requirements for leadership qualities [29]. In terms of the desirable leadership style and qualities, service economy calls for leaders that can carry out distributed leadership, in which they interact and communicate thoroughly with the followers and share the opportunity of decision-making with the followers. In addition, they can lead the organization in a transformational style, such as motivating followers to reach their potentials and empowering followers to work collaboratively and to achieve common goals [29]. These characteristics are incorporated into service leadership model.

Distinction of Service Leadership Model and Other Leadership Theories

As mentioned above, service leadership model adopts many ideologies from other leadership models, such as service orientation proposed by servant leadership. However, it has some unique features, which make it distinguished from other existing leadership models. For example, service leadership has seven core beliefs: 1) serve for oneself, others, and systems; 2) everyone can be a leader; 3) competencies, moral characters and caring are the three key attributes of service leaders; 4) competencies, willingness, abilities are important to service leaders themselves; 5) provide high quality of service; 6) evolutionary perspective of service leadership; 7) high pay and high position will go to people with service leader attributes [2, 10]. Moreover, service leadership adapts a maritime leadership style (vs. continental leadership style), which incorporates both top-down and bottom-up approaches in leader-follower interaction with regard to different situations (long-term planning, emergency or crisis) [2, 6].

Other Important Knowledge Points

There are some more knowledge points that a service leader needs to know. For instance, service reputation is critical to service industry. Hence, the integrity of service leaders is important and they must try their best to avoid errors or immoral conducts which bring bad reputation [11]. Service leaders should also understand the service, which is the core of humanity and has real value [11]. Besides, service leadership also highlights the importance of mentorship and choice of leadership style. Service leadership model is an evolving leadership model. From the evolutionary perspective, humans possess moral and caring intuitions in a long development history. Thus, service leadership could be considered as the oldest and longest surviving business model [2, 13].

After reviewing the above conceptual aspects of the service leadership knowledge framework, validated assessment tools that can measure the aforementioned knowledge of service leadership are needed. In particular, a knowledge scale with good validity and reliability is valuable for service leadership educators and researchers to examine the learning outcomes of effective service leadership education. First of all, the scale items need to be validated in terms of the extent to which scale items fall into the knowledge body of service leadership. As Rubio et al. [30] contended, “content validity refers to the extent to which the items on a measure assess the same content or how well the content material was sampled in the measure” (p. 94). Content validity usually informs us of “the degree to which elements of an assessment instrument are relevant to and representative of the target construct for a particular purpose.” (p. 238) [31]. The scale developers invited a panel of experts to evaluate the items and then the research team revised them according to the collected feedback [32]. The content of measures can be judged from several important perspectives: relevance, clarity, factor structure, representativeness, and comprehensiveness [20, 33]. In the current study, we mainly focused on relevance, clarity and representativeness of the knowledge scale.

OUR STUDY

In the current study we addressed the development of knowledge scale of service leadership and its content validation. The development of item pool was primarily based on the service leadership model [2, 5, 6] with reference to the previous literature regarding the knowledge points (e.g., self-leadership) [14, 15]. The content validation was conducted by inviting four experts to rate the relevance, clarity, and representativeness of each item. The process of scale development is described below.

Scale Development – Construction of Item Pool

The construction of item pool consists of three steps. First, we reviewed previous scales about leadership, which cover a wide range of leadership models: transformational leadership, authentic leadership, servant leadership, ethical leadership, leader-member exchange theory, spiritual leadership, participative leadership, relational leadership model, social exchange model of leadership development, and leadership identity development model. Via this practice, we found that measures tapping into the knowledge of a specific leadership model are missing in the literature. The majority of the leadership scales measures individuals' attitudes toward leadership and leadership behaviors [34-36]. There were also attempts to examine leadership knowledge. For example, Payne [37] designed 15 items to measure communication competence in leadership by asking the participants to select the most effective communication response in different communication scenarios.

In addition, considering the unique features of service leadership model, existing leadership scales that can be referred to are limited. In this case, we relied on the previous literature about service leadership, including Po Chung's books [3, 11, 12], Shek and colleagues' papers and book chapters [5, 6], as well as SLAM curriculum framework [2]. We first developed a conceptual framework based on this body of literature and developed items within this framework. The research team consisted of one senior researcher who provided supervision and three junior researchers who drafted, reviewed and cross-checked the items. All of them had doctoral degrees and had experience in research and teaching on service leadership.

The Service Leadership Knowledge Scale

With several rounds of iteration on items revision within the research team, 200 items of knowledge scale in a format of the multiple-choice question were generated. This scale includes following 11 categories (C1- C11):

C1. General description of service leadership (17 items). This category covers the definition, nature, and functions of service leadership. The items assess the understanding of the general feature of service leadership and service leader, such as the service-orientation.

C2. Three realms of service leadership (18 items). This category includes the knowledge about service leadership in three realms - self, others, and systems [2, 7, 11, 13-17]. The items measure knowledge about self-leadership, as well as the understanding of service leadership in oneself, teams and systems.

C3. Everyone can be a leader (11 items). This category includes the notion that everyone can be a leader. The items test the recognition of this notion and the theoretical root of this notion, including incremental theory about human attributes [2, 6, 11, 18, 38, 39].

C4. The general principle of $E=MC^2$ (11 items). This category includes the general description of the three determinants of effective service leadership – competence, moral character and caring disposition, as well as their nature and relevance to leaders and followers [2, 7, 11].

C5. Competencies (35 items). This category includes knowledge about competencies defined by SLAM framework (i.e., domain-specific competence, service competence, and leadership competence), as well as general intrapersonal competencies (IQ, EQ, AQ, and SQ) and interpersonal competencies (conflict management, assertiveness, and active listening) [2, 19, 20].

C6. Moral character (23 items). This category includes knowledge about moral character from a Western framework and Chinese philosophy. For the former, items assess the relevant concepts and knowledge about character strengths using Action in Value (VIA) model, which include wisdom, courage, humanity, justice, temperance, and transcendence [21, 22]. For the latter, items assess knowledge about Chinese virtue, particularly Confucian virtues, and its relation to service leaders [11, 24, 25].

C7. Caring disposition (17 items). This category includes knowledge about caring disposition within the SLAM framework [2]. The items assess knowledge about three core components of caring disposition – love, empathy and active listening [26], as well as the caring component of other leadership models [6].

C8. Positive social relationship (11 items). This category includes the knowledge about building, developing and maintaining positive social relationships. The items assess key factors to positive social relationship identified in the SLAM framework, general knowledge about relationship development (e.g., ABCDE model) [40] and social capital [2, 11, 27].

C9. Manufacturing economy versus service economy (18 items). This category includes knowledge about the differences of the features and leadership qualities between manufacturing economy and service economy [29] as well as the current societal status, particularly, the economic structure of Hong Kong.

C10. Distinction of service leadership and other leadership theories (24 items). This category addresses the knowledge about the unique features of service leadership model [2] compared with other leadership models in the literature. It is basically based on Shek et al.'s [6] paper reviewing differences of service leadership and other leadership models (e.g., transformational leadership, servant leadership, spiritual leadership, and ethical leadership).

C11. Other important knowledge points (15 items). This category includes the remaining knowledge points that are regarded as important in service leadership model, such as understanding of service, mentor-apprentice models and choice of leadership styles [2, 11, 13, 41].

The scale items were presented in various formats, such as filling the blank(s) of a concept or fact of service leadership, choosing the correct or incorrect descriptive statements of service leadership, and choosing a right combination of options to interpret a scenario of service leadership. Sample items of the scale can be seen in Appendix I.

Content Validation of the Developed Scale

With the item pool available, content validation was conducted to test how accurately the items assessed various aspects of service leadership knowledge. Four experts who are familiar with service leadership, especially the SLAM framework, were invited to judge the content validity of the 200-item Service Leadership Knowledge Scale. Three of them had a doctoral degree and were involved in the curriculum development and/or the teaching of the subject “Service Leadership.” The fourth one was an expert on service leadership working with Po Chung. A self-administered questionnaire was used to collect the opinions of the experts with the following procedure. First, they were invited to rate each item based on three criteria of content validity:

1. **Relevance**, the extent to which the item is appropriate in assessing the knowledge point and falls within the boundary of the SLAM framework on a 4-point rating scale:
 1 = *Irrelevant*, 2 = *Unable to assess the relevance without item revision or item is in need of revision or otherwise would no longer be relevant*, 3 = *Relevant but needs minor amendment*, 4 = *Relevant*
2. **Clarity**, the extent to which the item is concise, accurate, and direct on a 4-point rating scale:
 1 = *Very unclear*, 2 = *Unclear*, 3 = *Clear*, 4 = *Very clear*
3. **Representativeness**, the extent to which the item adequately represents and encompasses the essence of the knowledge point on a 4-point rating scale:
 1 = *Very unrepresentative*, 2 = *Unrepresentative*, 3 = *Representative*, 4 = *Very representative*

While giving the ratings, the experts were also invited to provide suggested modifications of the items for the negative responses (option 1 or 2). After rating all the items, they judged the overall quality of the whole scale based on the following items:

1. Does this batch of multiple choice questions cover all the essential knowledge in the service leadership framework?
2. Does this batch of multiple choice questions adequately represent the essential knowledge points in service leadership?
3. Overall speaking, are these multiple choice questions a valid measure of the basic body of knowledge covered in the Service Leadership and Management (SLAM) model?
4. Additional knowledge point(s), if missing from the knowledge scale (open-ended question).
5. Other comments (open-ended question).

The ratings from the four experts were used for analyses of content validity, while their suggested modifications and written feedbacks were taken into account when further revising the developed items.

OUR FINDINGS

Individual item content validity index (I-CVI) and average scale content validity index (S-CVI/ave) [30, 42] were calculated to indicate the content validity of the scale. I-CVI was computed by the number of positive responses in each item (option 3 or 4) divided by the number of experts. S-CVI/ave was an average score of the I-CVIs of all the items within each category or the overall scale. An I-CVI of .80 or higher indicates good content validity while S-CVI is at least .80, but preferably .90 or higher [42]. Considering we only had four judges, an I-CVI of .75 was considered to be acceptable. This approach has been used in previous scale validation studies in Hong Kong [43, 44].

As seen in Table 1, on individual level, most of the items had good I-CVI. All items had I-CVI(relevance) > .75, indicating that four experts agreed that all scale items were relevant to the service leadership knowledge under the SLAM curriculum framework. Except item 11, 17, 160 and 186, all items had I-CVI(clarity) > .75, showing that all experts considered most of the scale items were concise, accurate and direct. The four items with a fair I-CVI in clarity (I-CVI(clarity) = .50) were modified according to the suggestions from the experts. All items had I-CVI(representativeness) > .75, in the views of the experts, all the scale items could adequately represent the knowledge points of service leadership.

Table 1. The frequency of I-CVI and the S-CVI/ave for the whole scale

I-CVI	Number of items (percentage) (n=200)		
	Relevance	Clarity	Representativeness
0.25	0 (0%)	0 (0%)	0 (0%)
0.5	0 (0%)	4 (2%)	0 (0%)
0.75	9 (4.5%)	50 (25%)	14 (7%)
1.00	191 (95.5%)	146 (73%)	186 (93%)
S-CVI/ave	.99	.93	.98

Table 2. The S-CVI/ave for the subscales

No.	Category	No. of items	S-CVI/ave		
			Relevance	Clarity	Representativeness
C1	General description of Service Leadership	17	.96	.87	.96
C2	Three realms of Service Leadership	18	1.00	.93	1.00
C3	Everyone can be a leader	11	1.00	.91	1.00
C4	General description of the principle E=MC ²	11	.98	.91	.98
C5	Competencies	35	.99	.91	.99
C6	Moral character	23	1.00	.98	.99
C7	Caring disposition	17	.99	.91	.99
C8	Positive relationship	11	1.00	1.00	.98
C9	Manufacturing vs. service economies and current societal status	18	.99	.93	.99
C10	Distinction of Service Leadership and other leadership theories	24	1.00	.96	.98
C11	Other knowledge points in SLAM curriculum framework	15	.98	.88	.97

In regards to the overall scores, all the experts rated very positively the overall quality of the scale in terms of relevance, clarity, and representativeness, with $S-CVI/ave(relevance) = .99$, $S-CVI/ave(clarity) = .93$, and $S-CVI/ave(representativeness) = .98$, respectively (see Table 1). As can be seen in Table 2, for each category (total 11 categories), the results of $S-CVI/ave$ were also good, $S-CVI/ave(relevance) > .96$, $S-CVI/ave(clarity) > .87$, and $S-CVI/ave(relevance) > .96$.

DISCUSSION

The primary purpose of this chapter was to report the development of a scale to capture the knowledge of service leadership proposed by Chung [2] and the content validation of this study. The individual item content validity index (I-CVI) and average scale content validity (S-CVI) both indicate that the Service Leadership Knowledge Scale assesses various aspects of service leadership knowledge. The majority of the items were considered to be relevant to the body of knowledge about service leadership, clear and easy to understand, and representative of service leadership knowledge. The research team also reviewed and discussed the suggested modifications of particular items. Some items were modified before putting in the further validation studies.

The construction of the Service Leadership Knowledge Scale is a pioneering attempt to empirically assess the notion of service leadership proposed by Chung [2]. Since the launch of FSLI, substantial effort has been taken on promoting service leadership education, but the fundamental knowledge base of service leadership has been left unaddressed. The FSLI allows independent development of the curriculum of service leadership education, and thus the understanding of service leadership actually varies more or less across different institutions. This practice grants a great degree of autonomy for each institution to develop service leadership education and obtains great attainment to nurture a good number of university students into qualified service leaders [45]. However, there is still a strong need to specify the fundamental knowledge base of service leadership. Our current study initiated the endeavor to address this question, which indicates a good progress in the journey of the construction of service leadership theory. Of course, behind content validation effort, other means of scale validation should be conducted to clarify the content validity of the scale.

The present study had some limitations. First, we only had four experts for the content validation, although it still met the minimum acceptable number of three experts proposed by Lynn [46]. This is primarily because of the notion of service leadership is new and researchers or professionals who are working on it are rare. However, it limits the generalizability. Future research can consider inviting students who participated in service leadership course to rate the items. In addition, three out of four invited experts were academic researchers. Their understanding of the knowledge points of service leadership is mainly based on their research and teaching of the subject in an educational setting. They may not be fully aware of other practical knowledge point(s) of service leadership in an organizational field. Hence, experts from the field should be recruited. Lastly, the length of the current scale is very long, which possibly elicited fatigue in the raters. Hence, they might ignore some problems in the later part of the scale. Future studies may consider presenting the items in a different order to different raters, so as to reduce the effect of fatigue on the later part of the scale.

APPENDIX I: SAMPLE ITEMS (WITH ADAPTATION) OF THE KNOWLEDGE SCALE

Knowledge Point	Multiple Choice Question
C1. General description of service leadership	
1. Leadership is a service that ethically satisfies a wide range of individual, group, community, system and environmental needs.	Bill has the following understanding of leadership. Which one is <i>NOT</i> consistent with the Service Leadership and Management (SLAM) Model? A. Service leadership includes ethically serving oneself. B. A leader should regard his/her leadership as a service. C. As a leader, individual needs should surpass service recipients' needs. D. As a leader, one should provide service to ethically satisfy a wide range of needs, including the needs of individual, group, and system. (correct answer: C)
C2. Three realms of service leadership.	
19. Service leadership claims that leadership can be carried out in three realms, including self, others, and system.	The realms of service leadership include_____. A. life, family, and work B. self, others, and system C. friendship, organization, and society D. microsystem, macrosystem, and ecosystem (correct answer: B)
Knowledge Point	Multiple Choice Question

C3. Everyone can be a leader.	
36. Every day, every human occupies a position of leadership and possesses the potential to improve his leadership quality and effectiveness.	Service Leadership and Management (SLAM) Model asserts that everyone can be a leader. Which of the following statements is <i>NOT</i> the rationale underlying this proposition? A. Self-development can be regarded as one sort of leadership. B. Every day, there are many service transactions in which one can take a leading role. C. Leadership quality is malleable and improvable. D. Leadership is an inborn quality. (correct answer: D)
C4. The general principle of $E=MC^2$.	
48. Learning and habituating leadership competencies, which include character strengths and a caring disposition, can enhance one's leadership effectiveness.	According to the Service Leadership and Management (SLAM) Model, if Kate wants to become an effective service leader, she needs to: ① develop her leadership, intrapersonal and interpersonal competencies. ② have excellent scholastic achievement. ③ enhance her moral character. ④ consider the needs of others and provide care to others when they are in need. A. ①② B. ①③ C. ①②③ D. ①③④ (correct answer: D)
C5. Competencies.	
65. Generally speaking, intrapersonal competencies process information of the self and involve a wide range of abilities related to self-understanding and self-management.	Generally speaking, intrapersonal competencies process information of _____ and involve a wide range of abilities related to _____. A. the service system; serving others B. the service system; serving the society C. the self; self-understanding D. the self; serving others (correct answer: C)
C6. Moral character.	
115. "Ai" is affection for one's fellow human beings, marked by interpersonal relationships with care, respect and humanity. "Ren" refers to benevolence or humanity, pertaining to "loving people."	Among different Confucian virtues, which one is most relevant to caring disposition required in service leadership? A. Trustworthiness B. Wisdom C. Harmony and Peace D. Benevolence and Affection (correct answer: D)
C7. Caring disposition.	
124. Three major components of caring disposition Three major components of caring disposition: 1) love; 2) listening; 3) empathy.	Which of the following attributes is one of the three major components of caring disposition covered in the Service Leadership and Management (SLAM) Model? A. Individual consideration B. Mentoring C. Listening D. Coaching (correct answer: C)

Knowledge Point	Multiple Choice Question
C8. Positive social relationship.	
140. Five stages of relationship building—the ABCDE Model Regarding the relationship development, the most influential theory is the five-stage model (i.e., ABCDE Model) proposed by Levinger (1983), a relationship begins with acquaintance (A), goes through building-up (B) and continuation (C), and (alternatively) experiences deterioration (D) and finally ends (E).	According to Levinger (1983)'s five-stage model of relationship building, what is the correct sequence of the stages? A. Acquaintance; building-up; continuation; deterioration (alternative); end B. Acquaintance; continuation; building-up; deterioration (alternative); end C. Building-up; acquaintance; continuation; deterioration (alternative); end D. Building-up; acquaintance; deterioration (alternative); continuation; end (correct answer: A)
C9. Manufacturing economy versus service economy and current societal status.	
153. Leaders in the service economy should be flexible, high in openness, collaborative and motivated. Trust, fairness, respect and care are the “secret ingredients” that distinguishes successful service experiences from unsuccessful ones.	Leaders in the service economy should primarily possess the following attribute: A. Show respect toward the followers B. High intelligence C. Good academic achievement D. Good political sensitivity (correct answer: A)
C10. Distinction of service leadership and other leadership theories.	
170. A maritime (distributed) leadership style that is both top-down and bottom-up is more productive, competitive, profitable, and sustainable in service industries.	A maritime leadership style is: ① Authoritarian in nature ② Distributed in nature ③ Top-down ④ Bottom-up A. ① ③ B. ② ④ C. ① ③ ④ D. ② ③ ④ (correct answer: D)
C11. Other important knowledge points.	
193. The value of service is co-created by the service providers and consumers.	Which of the following statements about service is correct? A. The value of service is determined by the service providers. B. The value of service is determined by the consumers. C. The value of service is co-created by providers and consumers. D. The value of service is determined by the product managers. (correct answer: C)

Chapter 120

VALIDATION OF THE SERVICE LEADERSHIP KNOWLEDGE SCALE: CRITERION-RELATED VALIDITY

ABSTRACT

In order to assess the effectiveness of service leadership education, we developed the 200-item Service Leadership Knowledge Scale to measure knowledge related to service leadership. In this chapter, we report a validation study examining whether the developed scale could differentiate students who had received service leadership education from those had not (i.e., criterion-related validity). A posttest-only control group design was adopted to validate the scale, with 67 students in the experimental group and 93 students in the control group. As predicted, the experimental group scored higher on all domains and total scores compared to the control group. In terms of the individual item, the experimental group had higher scores on 163 items than did the control group, with statistically significant differences on 63 items. The present findings provide evidence supporting the criterion-related validity of the Service Leadership Knowledge Scale.

INTRODUCTION

Leadership training and education for young people are growing in the higher education sector in both Western and Chinese societies [1, 2]. Generally speaking, leadership education programs aim at improving and transforming leadership knowledge, attitudes, skills, and behaviors in the program participants. With the development of leadership programs, scholars and practitioners argued that it is important to conduct rigorous evaluations to examine the outcomes of leadership training programs [3, 4]. Unfortunately, an examination of the leadership literature shows that rigorous evaluation is sparse, particularly in the Chinese culture.

With specific reference to Hong Kong, a large-scale leadership project entitled the “Fung Service Leadership Initiative” was implemented in eight government-funded public universities through the financial support of the Victor and William Fung Foundation. The main purpose of this initiative was to encourage universities in Hong Kong to develop curriculum and related materials on Service Leadership to nurture a new generation of leaders that fit the current service era. The idea of service leadership was initially proposed by Po Chung, the co-founder of DHL International and the Chairman of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM). Chung and Bell [5] argued that to meet the challenges created by the transformation from the manufacturing economy to the service economy, universities have a responsibility to train service leaders. According to Chung [6], service leadership is about “satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments” (p. 5). To be an effective leader, one needs to possess domain-specific competencies and to demonstrate moral character and caring disposition.

With a common objective to nurture university students’ leadership qualities in the areas of leadership competencies, moral character, and caring disposition, these eight institutions have developed their leadership courses and programs independently [7]. However, evaluation research on these curricula and programs remain to be done. To sustain service leadership education and to develop the body of knowledge surrounding service leadership, systematic evaluation of program effectiveness and benefits of the program to the participants is strongly needed [8]. Obviously, sound evaluation depends on sound assessment instruments. However, validated instruments on leadership qualities, particularly those related to Service Leadership are virtually non-existent in different Chinese communities. As such, the research team of The Hong Kong Polytechnic University (PolyU) has started to work on the development of a battery of assessment instruments on service leadership. The purpose of the current study was to examine the criterion-referenced validity of the Service Leadership Knowledge Scale which has been developed to assess service leadership knowledge.

To understand the outcomes of an educational program, researchers are usually concerned about participants’ knowledge, attitudes, skills, and behaviors. Numerous examples can be found in the literature that assessed the participants’ knowledge, attitudes, skills, and behaviors. For example, Hsu [9] measured participants’ pro-environmental behavior and environmental knowledge to assess the effectiveness of a 16-week environmental education course. Ergene, Cok, Tumer, and Unal [10] examined the knowledge, attitudes, personal behaviors and awareness of HIV/AIDS among students who

received or did not receive HIV/AIDS education. In the field of leadership education, most of the evaluation focused on the participants' attitudes and behavior. For example, in the report of Zimmerman-Oster and Burkhardt [11], students' cognitive visioning ability, visioning behavior, optimism, transformational leadership, and inspirational motivation were assessed before and after the leadership development program.

Comparatively, fewer evaluation studies tested leadership knowledge gained through a leadership program, though it is not uncommon to ask the participants to rate how much they have learned from the program (i.e., subjective estimation of knowledge change). For example, after attending the 5-day Washington Leadership Conference, Stedman, Rutherford, Rosser, and Elbert [12] asked the participants to rate the extent to which they perceived themselves to be able to describe authentic leadership, define character and the four-stage model for building relationship, and attain other knowledge delivered during the conference. Definitely, acquisition of leadership knowledge is a desirable outcome for a successful leadership program. Without obtaining any updated knowledge about leadership (e.g., what qualities an effective leadership should have), it is difficult, if not impossible, for the participants to change their attitudes and improve their leadership practice. Therefore, it is necessary to test program participants' knowledge about leadership in order to examine the effectiveness of a leadership program. Unfortunately, validated assessment tools on leadership knowledge are rare.

To facilitate the evaluation of service leadership education, we have developed the Service Leadership Knowledge Scale to assess individuals' understanding of service leadership knowledge. This body of knowledge was mainly based on the service leadership model within the SLAM framework, including SLAM curriculum framework [5, 6], 12 dimensions of personal brand of service leaders [13], the "25 principles" of service leadership [14], and other publications by Chung, Shek and colleagues [e.g., 15, 16]. A total of 200 multiple-choice questions were generated to assess 11 domains of knowledge, including general description of service leadership, three realms of service leadership, the belief that "everyone can be a leader," the general principle of $E=MC^2$ (i.e., competencies, moral character, caring disposition), positive social relationship, manufacturing economy versus service economy, distinction of service leadership and other leadership theories, and other important knowledge points. In an introductory class on Service Leadership, these knowledge points are covered in the class and/or required readings.

When we developed the Service Leadership Knowledge Scale, a content validation study with four judges who had expertise in service leadership research, teaching or practice was conducted [17]. The study provides initial evidence suggesting that the items are clear, relevant to, and representative of service leadership knowledge within the SLAM framework. Nevertheless, while the experts had positive evaluation of the scale items, whether this scale possesses good criterion-related validity is unknown. Criterion-related validation is important because it can tell us whether the test scores are related to certain external criterion such as whether the participants have studied in a course on service leadership.

The current study was conducted to address the question about whether Service Leadership Knowledge Scale has criterion-related validity. According to Rubin and Babbie [18], based on when the criterion occurs, criterion-related validity can be divided into two types, including predictive validity (which informs the ability of the test scores to predict a criterion occurring in the future) and concurrent validity (which informs the correspondence to a criterion that has been known). Typically, concurrent validity is assessed by known-

groups validity where the scale would be administered to two groups that are theoretically known to differ on the construct measured, such as different levels of knowledge [19]. As pointed out by Portney and Watkins [20], “using the known groups method, a criterion is chosen that can identify the presence or absence of a particular characteristic, and the theoretical context behind the construct is used to predict how different groups are expected to behave. Therefore, the validity of a particular test is supported if the test’s results document these known differences.” (p. 89).

In the current study, the criterion was taking up versus not taking up a 3-credit general education course entitled “Service Leadership.” This course provides 39 hours of class learning about service leadership through lectures, reflection exercises, group discussions, role plays, drawings, and other experiential learning activities. Students also enrich their knowledge via group presentation and individual term paper. For details of the curriculum of this course, readers can refer to the two special issues of *International Journal on Disability and Human Development* [15, 16]. According to the known difference, we hypothesized that the participating students would have higher scores than the non-participating students on the knowledge scale items and scale scores.

Posttest-only control group design was adopted to examine the criterion-related validity of the Service Leadership Knowledge Scale. In this design, one group of students who had ever participated in this course served as the experimental group and the other group of students who had never participated in any courses or programs related to service leadership served as the control group. Both groups were assessed during the same period of time. In the current case, we did not collect data before the course (i.e., pretest) because it was difficult to recruit a comparable control group before the course. The composition of the students could not be confirmed until the third lecture as the students were allowed to freely add or drop the course during the first three weeks of the academic semester. Hence, we had to assess their knowledge after completion of the course only.

Although the adopted design cannot provide information about the change within individuals, the between-individual comparison can still inform us about the effectiveness of the program by comparing the participating students and non-participating students. There were plenty of cases in the program evaluation literature that adopted this design. For instance, to understand the effect of an educational intervention on the students’ attitudes toward elderly people, Moriollo, Smey, Pescatello, and Murphy [21] measured the knowledge and attitude towards elderly people one week and ten weeks after the completion of this intervention. Results found that participants who received this intervention had better knowledge about aging than the non-participants at Week 1 assessment. More importantly, as the major objective of the current study is to test the criterion-related validity of the scale, the posttest-only control group design apparently meets this requirement.

OUR STUDY

A total of 67 students (Mean age = 20.13, SD = 1.42) were recruited from the classes on a 3-credit “Service Leadership” course who formed the experimental group. Among them, 30 took the course in the first semester while 37 in the second semester of 2014-15 academic year. Another 94 students (Mean age = 20.46, SD = 1.51) who had not taken the course “Service Leadership” were recruited from a convenience sample and they served as the

control group. However, one participant from the control group took the subject “Service Leadership through Service Learning” which is a course delivering service leadership ideology via a service-learning approach. With the removal of these participants, 93 students remained in the control group. During the recruitment, we tried to match the background characteristics of the control group with those of the experimental group. The characteristics of the participants are presented in Table 1.

Table 1. Descriptive statistics about participants (n=160)

Demographic variables		Experimental Group <i>n</i> = 67	Control Group <i>n</i> = 93
Gender	Male	26 (38.8%)	48 (51.6%)
	Female	41 (61.2%)	45 (48.4%)
Year of study	Year 1	54 (80.6%)	65 (69.9%)
	Year 2	4 (6.0%)	7 (7.5%)
	Year 3	9 (13.4%)	19 (20.4%)
	Year 4	0 (0%)	2 (2.2%)
Faculty	Faculty of Applied Science and Textiles	6 (9.0%)	8 (8.6%)
	Faculty of Business	0 (0%)	5 (5.4%)
	Faculty of Construction and Environment	15 (22.4%)	18 (19.4%)
	Faculty of Engineering	15 (22.4%)	18 (19.4%)
	Faculty of Health and Social Sciences	7 (10.4%)	12 (12.9%)
	Faculty of Humanities	4 (6.0%)	1 (1.1%)
	School of Design	2 (3.0%)	5 (5.4%)
	School of Hotel and Tourism Management	18 (26.9%)	26 (28.0%)
General university requirement (GUR) courses related to leadership taken	Have taken “Tomorrow’s Leaders”	31 (46.3%)	41 (44.1%)
	Have taken “Tango! Managing Self and Leading Others”	0 (0%)	3 (3.2%)
	Neither	36 (53.7%)	49 (52.7%)
Other leadership course or workshop taken	Yes, have taken before	1 (1.5%)	4 (4.3%)
	No	66 (98.5%)	89 (95.7%)
Knowledge of service leadership	No knowledge	1 (1.5%)	34 (36.6%)
	Little knowledge	5 (7.5%)	36 (38.7%)
	Some knowledge	49 (73.1%)	21 (22.6%)
	A lot of knowledge	11 (16.4%)	2 (2.2%)
	All the knowledge	1 (1.5%)	0 (0%)
Leadership position ever taken	Yes, have taken before	46 (68.7%)	46 (49.5%)
	No	21 (31.3%)	47 (50.5%)
Overall work experience	Have work experience	62 (92.5%)	83 (89.2%)
	No work experience	5 (7.5%)	10 (10.8%)
Entrance exam	Hong Kong Diploma of Secondary Education Examination (HKDSEE)	35 (52.2%)	46 (49.5%)
	Hong Kong Advanced Level Examination (HKALE)	7 (10.4%)	21 (22.6%)
	National College Entrance Examination (NCEE) - in mainland China	1 (1.5%)	1 (1.1%)
	Associate Degree/ Higher Diploma in Hong Kong	23 (34.3%)	23 (24.7%)
	Others	1 (1.5%)	2 (2.2%)

The experimental group and control group did not differ in age ($t(158) = 1.39, p > .05$) gender ratio ($\chi^2(1) = 2.57, p > .05$), distribution of study year ($\chi^2(3) = 3.27, p > .05$), distribution of faculties ($\chi^2(7) = 7.67, p > .05$), ratio of participation in General Undergraduate Requirements (GUR) leadership course ($\chi^2(2) = 2.21, p > .05$), ratio of participation in other leadership courses/workshops ($\chi^2(1) = 1.01, p > .05$), ratio of having work experience ($\chi^2(1) = .50, p > .05$), and ratio of entering university through HKDSE ($\chi^2(1) = .12, p > .05$). However, more students in the experiment group (vs. control group) had ever taken a leadership position in groups, clubs or associations ($\chi^2(1) = 5.87, p < .05$). It is possible that students who had ever taken leadership post were more interested in a leadership course. Taken together, the experimental group and the control group were generally comparable in terms of the demographic background.

Students completed the knowledge survey through an online platform in a self-administration manner. The assessment period was within two months after the completion of the course in the second semester of the 2014-15 academic year. The 200 multiple-choice questions were grouped into 20 blocks with 10 questions each. The blocks were randomly presented to exclude order effect. Individual consent was attained at the beginning of the survey.

Instrument

The Service Leadership Knowledge Scale consists of 200 multiple-choice questions. It covers 11 domains of knowledge points that are intrinsic to service leadership, particularly the SLAM framework, including general description of service leadership (17 items), three realms of service leadership (18 items), the belief that “everyone can be a leader” (11 items), the general principle of $E=MC^2$ (11 items), leadership competencies (35 items), moral character (23 items), caring disposition (17 items), positive social relationship (11 items), manufacturing economy versus service economy (18 items), distinction of service leadership and other leadership theories (24 items), and other important knowledge points (15 items). The details of this scale can be seen in the content validation study of the Service Leadership Knowledge Sale in this special issue (Shek et al., in press). The coverage of each domain is presented below.

1. *General description of service leadership*: the definition and general principles of service leadership model.
2. *Three realms of service leadership*: knowledge on the three realms of service leadership, i.e., self, other, and system.
3. *Everyone can be a leader*: knowledge on the belief about the notion “everyone can be a leader.”
4. *The general principle of $E = MC^2$* : the principle that moral character, competencies and caring disposition determine the effectiveness of service leadership.
5. *Competencies*: knowledge about intrapersonal (e.g., EQ, AQ, SQ) and interpersonal competencies (e.g., assertiveness, conflict resolution).
6. *Moral character*: knowledge about character strengths and Chinese virtues.

7. *Caring disposition*: knowledge about caring disposition, particularly, love, empathy, and active listening.
8. *Positive social relationship*: knowledge about building, developing and maintaining a positive social relationship.
9. *Differences of manufacturing economies and service economies*: knowledge about differences of the features and leadership qualities under manufacturing economy and service economy.
10. *Distinction between Service Leadership theory and other leadership theories*: knowledge about the distinction of service leadership and other leadership theories.
11. *Other important knowledge points of service leadership*: related knowledge that is important for a service leader to know, such as mentor-mentee model, understanding of service and service reputation.

Students also reported some demographic information (e.g., gender, year of study, and work experience, see Table 1). In addition, students rated how much they know about service leadership (i.e., self-evaluation of their own knowledge about service leadership).

Table 2. Independent t-test of the scale and subscales

No.	Category	Experimental Group M (SD)	Control Group M (SD)	t value	Effect Size (Cohens' d)
C1	1. General description of Service Leadership	.42 (.20)	.31 (.15)	4.08***	.65
C2	2. Three realms of Service Leadership	.41 (.17)	.33 (.14)	3.43**	.55
C3	3. Everyone can be a leader	.40 (.20)	.30 (.16)	3.54**	.56
C4	4.1 General description of the principle $E=MC^2$	.48 (.29)	.31 (.20)	4.39***	.70
C5	4.2 Competencies	.44 (.20)	.33 (.13)	4.23***	.67
C6	4.3 Moral character	.37 (.15)	.31 (.12)	2.95**	.47
C7	4.4 Caring disposition	.43 (.21)	.30 (.14)	4.66***	.74
C8	4.5 Positive relationship	.31 (.19)	.25 (.15)	2.46*	.39
C9	5. Manufacturing vs. service economies and current societal status	.40 (.20)	.30 (.15)	3.74***	.59
C10	6. Distinction of Service Leadership and other leadership theories	.38 (.19)	.32 (.15)	2.56*	.41
C11	7. Other knowledge points in SLAM curriculum framework	.34 (.20)	.27 (.14)	2.61*	.41
	Total mean score	.40 (.15)	.31 (.10)	4.79***	.76

Notes: "1" was given to the accurate answer, while "0" was given to the wrong answer.

* $p < .05$; ** $p < .01$; *** $p < .001$.

FINDINGS

This study was conducted to test the criterion-related validity of the Service Leadership Knowledge Scale. We first coded the items according to their accuracy. For the 200 multiple-choice questions, "1" was given to the items with correct answers, while "0" was given to the items with incorrect answers. Next, we performed independent t-test analyses to compare the scores of those students who had taken the subject "Service Leadership" and those who had not attended any courses or programs on service leadership. Analyses were conducted on the score of each domain and total scores. As shown in Table 2, the scores of the experimental

group were significantly higher than those of the control group in all domains, $t_s > 2.46$, $p_s < .05$, Cohens' $d_s = .39 - .74$. The effect sizes were about medium. Such difference was observed in the total score, with the effect size approaching large, $t(158) = 4.79$, $p < .001$, Cohens' $d = .76$. When assessing individual item, we found that the experimental group had higher scores on 163 items, with 63 items reaching a statistically significant level at $p < .05$. When the students were asked to rate their knowledge about service leadership, students in the experimental group perceived themselves knowing more about service leadership than their counterparts, $t(158) = 10.06$, $p < .001$, Cohens' $d = 1.60$.

DISCUSSION

In response to the lack of assessment instrument measuring individuals' knowledge level with regard to service leadership, we developed a 200-item Service Leadership Knowledge Scale. The purpose of the current study is to test its criterion-related validation through comparing students who had received service leadership education (i.e., experimental group) and students who had not (i.e., control group). The results showed that the scores of the experimental group were better than those of the control group in all 11 domains of knowledge points. When individual items were assessed, the experimental group had higher scores than the control group on 163 items. Amongst them, 63 items could statistically significantly differentiate the experimental group and the control group. To illustrate, the items about the definition of leadership competency items about desirable leadership qualities in service economy were able to differentiate the experimental group from the control group.

Overall speaking, the students who attended service leadership course knew more about service leadership, no matter in their self-perception or objective performance. Results suggest that this scale objectively assesses the basic knowledge on service leadership which could be acquired via service leadership education. Generally speaking, the criterion-related validity of this scale is good.

However, some items failed to differentiate the two groups. There are two possible explanations for this observation. First, this scale covers a wide range of knowledge points, perhaps, too wide for a student who only took 39-hour of class learning to capture. This scale includes not only the knowledge from the SLAM curriculum, but also other knowledge points regarded important by Chung and his colleagues [e.g., 14-16] in other publications. The comprehension of all these knowledge points depends not only on the class learning, but also the intensive reading on these papers and book chapters. For example, the knowledge about manufacturing economy and service economy was briefly taught in the first lecture, while the teacher highly recommended students to know more by reading Shek, Chung, and Leung [22]'s paper. Since there was no examination in this course, it is possible that not all the students read these papers though they were listed as required readings. Therefore, both the experimental group and the control group failed to answer some questions.

Second, as some knowledge points are not unique to service leadership, the students may learn them from other sources. For example, the knowledge about emotional intelligence, interpersonal competence, and positive social relationship can be acquired from psychology

courses, educational books, and other public channels. Therefore, some students from the control group were able to get a correct answer even without attending the service leadership course. However, these possibilities do not mean that the questions weak in differentiation are not important for a service leader. Further studies are needed to validate the current findings and examine what kind of knowledge is critical to the leadership effectiveness or work performance of service leaders. In the present study, there are at least 63 items that can differentiate the two groups which may form a short form of the Service Leadership Knowledge Scale.

Although the present study is a pioneer in the field of service leadership, there are four limitations. The first one is the lack of other methods to test criterion-related validation. We only used one criterion to assess the concurrent validity of the scale. In order to provide more validation evidence, future studies need to consider other criteria such as whether this scale is related to the likelihood of taking a leadership position in the future. The second limitation concerns the absence of pretest data. The current study only examined posttest without baseline assessment. Therefore, we should be cautious about making any causal inference that the occurrence of group difference in the knowledge is because of receiving the service leadership education. Future studies would benefit from a full quasi-experimental design with experimental group and control group assessed before and after receiving the service leadership education.

Another limitation of the study is that the homogeneity of the sample which may limit the generalizability of the findings to other population. The current experimental group was recruited from one course at the PolyU, while students that joined other service leadership courses or programs were not included. We knew that there are other approaches of service leadership education offered by the PolyU and other institutions in Hong Kong [7]. Therefore, the current findings need further replication with a more heterogeneous sample of students who joined other service leadership courses/programs. The final limitation is about the length of the scale, which may be too long for the participants. Students would be easily fatigued during the survey, which probably undermines their performance. Therefore, a short-version of knowledge scale is highly needed to quickly capture individuals' understanding of service leadership. As suggested by the current findings, we can develop a short form based on the 63 items which can detect significant differences between the two groups.

ABSTRACT

The notion of service leadership has been proposed to meet the demands of service economies. However, there is no scientific measure of people's attitudes toward service leadership. We thus developed the 132-item Service Leadership Attitudes Scale (SLAS) with an objective to measure individuals' attitudes and beliefs toward leadership qualities and leadership practices upheld by service leadership model. In this chapter, we report on the content validation based on the responses of three judges of experts. Results showed that the items were perceived by the experts to be relevant to, clear, and representative of the construct measured. The development of SLAS has implications for leadership development and education.

INTRODUCTION

There is a global trend of economic transformation from manufacturing mode to service mode [1, 2], which requires a paradigm shift in the conceptualization of leadership. In manufacturing economies, good leaders are often regarded as those with extraordinary competence and ability to achieve the greatest productivity. A stereotypical image of a leader in that era would be a person with power and authority who completely controls the operation. However, with the emergence of the service era, previous effective leadership qualities become increasingly inappropriate. Instead, the service era demands people-orientation (vs. task-orientation), relationship orientation (vs. man-machine interaction), service-orientation (vs. manufacturing orientation), morality (vs. maximization of profits), and soft skills (vs. hard skills) in leaders [3, 4]. The shifting economic environment calls for a new ideology of leadership that increases the competitiveness of team in the service economies.

In response to this call, Chung [5] proposed the notion of service leadership and asserted that service leadership “is about satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments” (p. 5). Chung and his colleagues further enriched the idea of service leadership within the framework of the Hong Kong Institute of Service Leadership and Management (SLAM) [6-9]. The idea of service leadership is in sharp contrast to the traditional leadership style in the manufacturing economies where leaders’ control, hierarchy, bureaucratic efficiency, and self-interest are of prime concern [10]. It is featured with seven core beliefs, which serve as the fundamental cognition of a service leader [11].

First of all, service leaders believe that leadership is “a service aimed at ethically satisfying the needs of self, others, groups, communities, systems, and environments” (Core Belief 1) [11]. In contrast to the view regarding leadership as an instrument to obtain profit and fame, service leaders serve the needs beyond the self. During service provision, service leaders also believe that high-quality personalized service is important as it will influence the commitment and loyalty of the followers toward the leader. As a result, service leadership “is about creating appropriate personal service propositions in real time and constantly striving to provide the highest quality service one afford to everyone one comes into contact with and whose lives are affected by one’s actions or leadership” (Core Belief 5) [11]. To service leaders, service activities are not regulated by external forces such as material reward or punishment alone. Instead, the drive for serving others and being served by others has been evolved over history and hard-wired into human nature. Service leadership is thus regarded as the “oldest, most competitive and longest serving business model” (Core Belief 6) [11].

Different from the idea that successful leadership is determined by one’s competence, service leadership model posits that “leadership effectiveness and service satisfaction are dependent on a leader or service provider possessing relevant situational task competencies plus being judged by superiors, peers, and subordinates as possessing character and exhibiting care” (Core Belief 3) [11]. In brief, effective service leadership (E) is a function of one’s moral character (M), competencies (C), and caring disposition (C) (i.e., $E=MC^2$). Service leadership model emphasizes moral character and caring disposition relative to competence, as they believe that demonstration of moral character and caring disposition helps to win trust

and respect from the followers, which further benefit leaders, followers, and the collective. The idea of “hire for character, train for skills” [7] well exemplifies this belief.

Besides service leadership skills, successful service leaders should also have positive beliefs about leadership development. Initially, they believe in average people’s capacity to be a leader, specifically, “every day, every human occupies a position of leadership and possesses the potential to improve his or her leadership quality and effectiveness” (Core Belief 2) [11]. By holding this belief, service leaders are more likely to adopt distributed leadership, which encourages the initiative-taking and participation of followers into decision-making. Chung deeply believes that distributed leadership is the formula for building up a successful corporate culture in service business, and he explained that “the formula is very simple: give people something within their ability to decide and the power to do it, make this part of their daily life” [12]. Furthermore, the Core Belief 2 implies the possibility for improving leadership. Actually, service leaders believe that “service includes self-development efforts aimed at ethically improving one’s competencies, abilities, and willingness to help satisfy the needs of others” (Core Belief 4). A commitment to continuous improvement is required by service leadership. Such efforts in self-development would pay off, because “now and in the future, high-paying, high status positions and management promotions will go to people who have domain specific knowledge and skills plus service leadership competencies, appropriate character strengths and a caring social disposition” (Core Belief 7) [11].

Although the service leadership ideology has been delivered to many college students in Hong Kong via educational activities in the Fung Service Leadership Initiative (FSLI) [13], the theoretical underpinning of service leadership is still in its infancy. The initial ideas were primarily based on the business experience and wisdom of Po Chung, in particular, his experience as the co-founder of DHL International. Later, with the implementation of FSLI, scholars from the eight government-funded tertiary institutions in Hong Kong contributed to the theoretical development of service leadership. However, the theoretical model with its underlying assumptions and inferred propositions has been left untested, which hinders the transition of service leadership model from experiential wisdom to scientific theory. A lack of validated assessment instrument is apparently an obstacle for the further advancement. As argued by Slavec and Drnovšek [14], “effective measurement is a cornerstone of scientific research ... reliable and valid measures contribute to the legitimacy and development of a research field” (p. 39).

With the measure that assesses the attitudes and beliefs toward service leadership, multiple research questions can be tested. For example, Chung and Bell [6] mentioned that despite the service industries have contributed a large share to the Hong Kong GDP, many leaders still hold the traditional attitudes toward leadership inherited from the manufacturing era. This observation can be tested by assessing the degree of endorsement of service leadership attitudes and beliefs among leaders in different organizations. Additionally, what are the consequences of service leadership attitudes and beliefs is one of the top questions awaiting to be solved in this field. For example, would such attitudes and beliefs predict service leadership practice? Would such attitudes and beliefs benefit one’s teamwork? As such, there is a need to develop and validate an assessment instrument that measures to what extent people evaluate service leadership.

LEADERSHIP ATTITUDES SCALES

How one behaves as a leader is affected by one's beliefs about ideal leadership [15]. However, compared to the abundance of measures assessing leadership behavior or practice, assessment instruments about leadership beliefs and attitudes are relatively rare. In the 1950s-70s, two scales were developed to understand the fundamental beliefs of people towards leadership, one is the Leadership Opinion Questionnaire (LOQ) developed by Fleishman [16] and the other is the leadership belief questionnaire developed by Haire, Ghiselli, and Porter [17]. LOQ asks participants to report their attitudes toward leadership practice by evaluating how frequently they thought they should do the described behavior. It consists of two dimensions of behavior, including consideration (e.g., "help people in the work group with their personal problems"; "back up what people under you do") and initiating structure (e.g., "emphasize meeting of deadlines"; "meet with the work group at regularly scheduled times"). This scale has been used in leaders from different kinds of organizations [16, 18]. However, as the concepts of consideration and structure were criticized by the leadership scholars [19, 20], this scale gradually received less attention in leadership research.

Another scale on attitudes toward leadership primarily measures leaders' fundamental beliefs toward democratic/participative vs. dictatorial/authoritarian leadership [17]. Specifically, it covers one's beliefs about average people's capacity for leadership and initiative, sharing information, participative management, and internal vs. external control of the individual toward the job. This scale was often used to examine the beliefs of leadership in different cultures [e.g., 17, 21]. However, the construct validity of this scale was questioned by Bottger, Hallein, and Yetton [22], as the items measuring beliefs about leadership capacity referred to average people, while the rest of them referred to subordinate, which are not consistent. Similarly, this scale has been rarely used nowadays.

After the millennium, the most commonly used scale nowadays is Leadership Attitudes and Belief Scale (LABS) developed by Wielkiewicz [23]. Adopting the ecological model of leadership [23, 24], he first developed a scale to assess serials of attitudes and beliefs about leadership in college students. In the original LABS (LABS-R), 86 items were generated with regard to attitudes toward authority (i.e., leaders' authority status), ethics (i.e., the importance of ethics in leadership), learning orientation (i.e., importance of learning in personal development and organization), relationship orientation (i.e., the importance of cooperation), change (i.e., consideration of change in leadership process), positional leader dependence (i.e., dependence of leadership on position), and systemic thinking (i.e., the influence of systemic process on leadership process). The initial scale later was narrowed down into two dimensions with 28 items (LABS-III) [25], including systemic thinking (e.g., "everyone's ideas and concepts could make contributions to the organizational success") and hierarchal thinking (e.g., "believing in the position determined organizational leadership"). In general, the LABS-III was widely used among college students regardless of whether they were taking a leadership position or not. For example, it was successfully used to investigate the role of gender and college experience in leadership attitudes [26, 27].

Other researchers also developed their own attitudes scales, but were rarely used by other researchers. For example, Rao [28] developed the Supervisory and Leadership Beliefs Questionnaire (SLBQ) to investigate the leadership beliefs of supervisor for effectively

guiding subordinates, and Hiller [29] developed the Orientation Toward Leadership Scale in the thesis aimed to measure of individuals' conception of leadership.

The scales reviewed above cover some concepts related to service leadership model. For example, the LOQ measures leaders' opinions about consideration which is similar to attitudes toward caring disposition in the service leadership model. Haire et al.'s [17] scale measures attitudes toward average people's capacity to take a leadership role, which is related to the attitudes toward the core belief "everyone can be a leader". LABS-R measures individual attitudes about to what extent ethics should play an important role in leadership process, which is similar to attitudes toward moral character. Finally, most of these measures concern democratic vs. authoritarian leadership attitudes, which is related to attitudes toward distributed leadership.

However, some essential components of service leadership were missing in the scale literature. The most obvious deficit is the lack of measures assessing individuals' attitudes toward the role of service in leadership (e.g., to what extent, a leader should serve others). Other critical attitudes such as the attitudes toward the importance of multiple competencies in leadership, self-leadership, and the nature of service are absent in the leadership assessment instruments. More importantly, most of the existing scales were developed for people occupying specific leadership positions (e.g., LOQ and SLBQ). As service leadership model uphold the belief in everyone's capacity and potential to be a leader, it is necessary to understand how average people think about service leadership irrespective of their experience in their positions.

THE SERVICE LEADERSHIP ATTITUDES SCALE [SLAS]

Against this background, we developed the Service Leadership Attitudes Scale [SLAS], which attempts to assess individuals' attitudes and beliefs about desirable leadership practices and leadership qualities within the SLAM framework. Specifically, it taps on one's attitudes and beliefs about what a desirable service leadership process should be, what kind of qualities a good leader is expected to possess, and what kind of functions a good service leader is expected to perform. A total of 10 aspects of attitudes/beliefs extracted from the core beliefs of the service leadership model were deemed important [7-9,30], which serve as the conceptual framework for the scale development.

First, according to the definition of service leadership, service leaders regard leadership as a sort of service rather than a means to obtain profit and frame. Thus, service leaders should have a service orientation, which includes regarding leadership as a service and having the willingness to surpass self-interest to serve others. This is the fundamental attitude toward leadership that differentiates service leadership from other traditional leadership developed in the manufacturing economies. Second, service leadership model upholds the belief that "everyone can be a leader and has the potential to develop leadership qualities" [11]. People who endorse this belief would have more confidence to assume leadership and improve their leadership qualities. Third, service leaders tend to regard distributed leadership as a desirable leadership practice. As noted by Chung and Bell [7], "distributed leadership suggests that an organization has been structured so that appropriate leadership decisions are pushed down to their lowest practical level" (p. 73). To adopt distributed leadership, leaders need to have

favorable attitudes toward 1) shared decision-making such as allowing their subordinate to voice out their opinions and contribute to the decision-making process, 2) empowerment of followers such as encouraging their followers to take initiative and delegating greater authority to their followers, and 3) trust and respect towards followers' views such as acknowledging their views and trusting their abilities to make good decisions.

Fourth, service leaders tend to believe that service leadership increases one's employability. Specifically, service leaders believe that high-status and high-paying leadership positions will go to leaders who are willing and capable to serve others. Fifth, in the service economies, one-size-fits-all service is no longer an optimal choice. Instead, a good leader needs to create high-quality personalized service and sensitive to individual needs. Service leaders would consider providing personalized service as a desirable leadership practice. Sixth, service leaders believe that providing service is intrinsically enjoyable to the service providers, as the tendency to serve others has been evolved into the core of humanity. Service leaders would not regard service provision as regulated by an external force such as reward and punishment but motivated by human nature, which has been evolved over history.

Seventh, service leaders believe that good leaders should have multiple intrapersonal competencies and interpersonal competence. There are four kinds of intrapersonal competencies that a good service leader should have, including IQ, EQ, AQ, and SQ. Intelligence quotient (IQ) includes comprehension and analytical abilities, independent thinking, critical thinking, logical reasoning and argumentation, flexibility (i.e., knowing how to improvise on the spot), and good problem-solving ability. Emotional quotient (EQ) includes understanding one's own emotions and others' emotions and managing one's own emotions and relationship with others. Adversity quotient (AQ) includes the ability to accept and cope with kinds of adversity and bounce back from the adversity. Finally, spiritual intelligence quotient (SQ) includes the ability to use meaning, vision, and other spiritual resources to solve personal problems and motivate the followers [31]. Service leaders would regard these competencies as important to a good leader. In addition, service leaders believe that good leaders should demonstrate interpersonal competencies in terms of being passionate about people, developing and maintaining a positive social relationship, being assertive, being able to collaborate and cooperate with people, being able to resolve conflicts within the team/in the services, and having good communication skills.

Eighth, service leaders hold a view that good leaders should demonstrate moral character. It includes maintaining a well-developed personal code of ethics characterized by integrity, fairness, and humanity, acting as an ethical role model, and believing in the power of morality, which is about winning trust and respect from the followers by one's virtues instead of power. Ninth, service leaders believe that good leaders should demonstrate a caring disposition, including care and concern about others as well as taking care of others. For the care and concern, they believe that empathy and compassion are two major qualities that good leaders should have. For taking care of others, they believe that good leadership involves loving followers by showing benevolence, affection, and forgiveness, supporting followers by providing physical and psychological resources to the followers, and developing followers by nurturing the growth of followers, coaching and mentoring the followers.

Finally, service leaders have a positive attitude toward a commitment to continuous improvement. They would have a growth mindset rather than a fixed mindset about leadership, believing that leadership can be changed and nurtured. Regarding the malleability of human attributes, people usually have two kinds of mindsets. People who adopt a growth

mindset believe that human attributes such as intelligence and personality could be developed through nurture while those who adopt a fixed mindset believe that human attributes are determined by nature [32]. In contrast to the notion of “elite” or “inborn” leadership, the service leadership model asserts that everybody is (and can be) a leader. It adopts a humanistic perspective that every individual has potential to be a leader and that leadership qualities can be changed and improved. It emphasizes self-leadership and self-reflection and considers them as good practices for a leader. Before one can lead others, one must first be able to lead oneself. In addition, service leaders must engage in constant reflection on one’s character, strengths, weaknesses, and service provision in order to seek for continuous improvement both professionally and personally. Generally, they believe in free will of human and tend to endorse Theory Y relative to Theory X about human behavior in organizations. Theory X and Y were proposed by McGregor [33] which concern the assumptions of human behavior in organizations. The underlying assumption of Theory X is that humans are inherently lazy, incapable of self-control, and have little to contribute to the effectiveness of the organization. On the contrary, Theory Y assumes that humans are not inherently lazy, but are capable of self-direction and self-control, and are able to positively contribute to the organization. Theory X implies that leaders must closely monitor the behaviors and performance of followers, whereas Theory Y encourages distributed leadership through delegation and autonomy. Service leaders are supposed to endorse Theory Y.

Based on the theoretical propositions of the Service Leadership Model, the scale development was conducted by a team of four researchers with teaching and research experience in service leadership. The three junior researchers drafted the items and the senior research modified items and supervised the whole process. With several rounds of re-iteration, a total of 132 items were created. Respondents are requested to report the degree to which they agree or disagree with the 132 statements that describe desirable leadership qualities or leadership practices on a 6-point Likert scale. With the items ready, the first question we would like to address is whether this batch of items measure the target constructs. Therefore, we examined the content validity of this scale. Content validity refers to “the extent to which elements of an assessment instrument are relevant to and representative of the targeted construct for a particular assessment purpose” [34]. In the scale development, many researchers used content validation as the first filter to select the good items [e.g., 35, 36]. In this study, we relied on the evaluation of three judges of expert for the content validation.

OUR STUDY

Three experts who were familiar with service leadership, especially the framework of the Hong Kong Institute of Service Leadership and Management (SLAM), were invited to judge the content validity of the 132-item Service Leadership Attitudes Scale. All of them had a doctoral degree and were involved in the curriculum development and/or the teaching of the subject “Service Leadership”.

Instrument

The experts evaluated the scale independently via content validation form. The raters judged the content validity in the following aspects for each item:

- Relevance (1 = Irrelevant, 2 = Unable to assess the relevance without item revision or item is in need of revision or otherwise would no longer be relevant, 3 = Relevant but needs minor amendment, 4 = Relevant)
- Clarity (1 = Very unclear, 2 = Unclear, 3 = Clear, 4 = Very clear)
- Representativeness (1 = Very unrepresentative, 2 = Unrepresentative, 3 = Representative, 4 = Very representative)

They were invited to provide justifications if negative responses were given. Besides the ratings for individual items, the experts were invited to evaluate the overall quality of the scale with reference to the following questions:

1. Does this batch of multiple choice questions cover all the essential attitudes/beliefs in the service leadership framework?
2. Does this batch of multiple choice questions adequately represent the essential attitudes/beliefs in service leadership?
3. Overall speaking, are these multiple choice questions a valid measure of the basic body of attitudes/beliefs covered in the Service Leadership and Management (SLAM) model?
4. Additional attitude(s)/belief(s), if missing from the scale (open-ended question).
5. Other comments (open-ended question).

FINDINGS

In the present study, content validity was determined by the judgements of experts. Individual item content validity index (I-CVI) and average scale content validity index (S-CVI/ave) [37, 38] were calculated to indicate the content validity of the scale. I-CVI was computed by the number of positive responses (option 3 or 4) divided by the number of experts [i.e., 3]. S-CVI/ave was a mean score of the I-CVIs of all the items within each category or the overall scale. This approach has been used in previous scale validation studies [35].

Table 1. The frequency of I-CVI and the S-CVI/ave for the whole scale

I-CVI	Number of items (percentage)		
	Relevance	Clarity	Representativeness
0.33	0 (0%)	0 (0%)	1 (0.8%)
0.67	3 (2.3%)	11 (8.3%)	2 (1.5%)
1.00	129 (97.7%)	121 (91.7%)	129 (97.7%)
S-CVI/ave	.99	.97	.99

Table 2. The S-CVI/ave for the subscales

No.	Domains	No. of items	Relevance	S-CVI/ave	
				Clarity	Representativeness
C1.	Service orientation	5	1.00	.93	1.00
C2.	Everyone can be a leader	4	1.00	1.00	1.00
C3.	Distributed leadership	13	.97	.95	.95
C4.	Employability	2	1.00	1.00	1.00
C5.	Personalized service	3	1.00	1.00	1.00
C6.	Attitudes toward service	2	1.00	1.00	1.00
C7.	Competencies	45	1.00	.99	1.00
C8.	Moral character	18	.98	.96	.98
C9.	Caring disposition	15	1.00	.98	1.00
C10.	Commitment to continuous improvement	25	.99	.96	.99

On an individual level, most of the items had good I-CVI (see Table 1). Among 132 items, 129, 121, and 129 items were regarded as relevant, clear, representative, respectively, by all the judges. The items were modified according to the judges' comments. The S-CVI/ave for the whole scale indicated an excellent content validity (see Table 1). For each category, S-CVI/ave was also very good (see Table 2). Finally, all the judges showed favorable responses to the questions about the overall quality of the scale. They regarded it able to cover all the essential attitudes/beliefs of service leadership, adequate to represent the essential attitudes/beliefs of service leadership, and valid to measure the basic body of attitudes/beliefs covered in the SLAM framework.

DISCUSSION

The purpose of this study was to examine the content validity of a newly developed scale – The Service Leadership Attitudes Scale (SLAS). Consistent with the SLAM framework [6-9], we developed the Service Leadership Attitudes Scale to measure how individuals think about service leadership regardless of their leadership experience. To our best knowledge, this is the first scale assessing individuals' attitudes and beliefs toward leadership qualities and leadership process upheld by the SLAM framework. Besides, as there are very few leadership attitude scales, this study is also one of the few attempts to validate leadership attitudes scale.

The first question regarding the development of the scale is whether it measures what it is supposed to measure. Our results support the content validity of the scale based on the views of three experts. Results showed that almost all items were rated as relevant to the construct by all three judges of expert except three items. All but 11 items were rated as clear by all three judges. Only one item was regarded as unrepresentative of the construct by two judges and two items were regarded as unrepresentative of the construct by one judge. Items were revised with the suggestion of the judges. For example, the item that “good leader upholds the principle of ‘leading by personal example’” was created to measure the construct of role modeling in moral character, but it was regarded as irrelevant, unclear and unrepresentative of the construct by one expert. This item was thus revised as “a good leader sets an example for others to follow”. Another item “the views of leaders are always better than those of their subordinates” was replaced by the item “a good leader does not let their followers participate

in the decision-making process” to represent the construct of shared decision making of distributed leadership, because it was regarded as unrepresentative of the construct by two judges. Generally speaking, the three judges regarded this batch of items covering the essential attitudes and beliefs within SLAM framework. Sample items were presented in Appendix 1.

The development of the SLAS has theoretical and practical significance to the field of leadership theory and education. The attention toward leadership attitudes in the academia seems to fade out after 1980s, with leadership scholars and practitioners focusing more on the overt leadership behavior [39]. The underlying attitudes/beliefs that a leader hold have been left under-examined or incorporated into leadership style (e.g., spiritual leadership) [40] for a long period of time. Although it is well-known that the link between attitudes/beliefs and actual behavior is not perfect [41], leadership attitude itself is important, as it assesses the cognitive aspect of leadership development [42]. Change in attitudes toward leadership (e.g., from a leader-centric perspective to a systemic perspective) signifies the development of leadership [27]. The development of SLAS would contribute to our understanding of service leadership development. Practically speaking, it also helps with educational program evaluation. Specifically, this scale will help us know whether the current service leadership education or other learning experience is effective to transform people’s views about leadership. Besides, understanding one’s attitudes towards leadership also helps to understand the training needs of the respondents.

This study is not free of limitations. Obviously, the number and heterogeneity of the experts involved in this study was limited. Only three experts rated the scale, although it still met the minimum acceptable number of three experts proposed by Lynn [43]. Obviously, the confidence in the robustness of the rating will increase with the increase in the number of judges [34]. Additionally, the three experts were all in the academia, and thus their feedbacks were more scholastic-oriented. It is difficult to recruit other experts outside academia as the idea of service leadership has not been widely and deeply delivered yet. However, as suggested by Haynes et al. [34], population sampling can be used, in which the people from the target population can be invited to rate the scale. Thus, we can ask colleagues in the business field who have received training in service leadership to share their feedbacks on the items in the future. Moreover, the judges were required to rate the items only instead of all the elements of the scale. As recommended by Murphy and Davidshofer [44], all the elements of an assessment instruction including instructions, response format, and scaling point should be under review. However, this study did not expressly request the judges to provide feedback on these elements, although one judge suggested to revise the scaling point from 6-point to 7-point in the open-ended question of “general comments”. We can draw attention of judges to these elements in the future studies of content validation.

Despite these limitations, this study shows an initial yet important step in developing a scientific measure to assess people’s attitudes toward service leadership. The scale was considered to be valid in terms of its content. Further studies on other aspects of validity await to be done.

ACKNOWLEDGMENTS

This paper and the related research project on the development of the assessment tools for the Service Leadership Model are financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the International Journal on Disability and Human Development in 2018 (Volumn17, issue 1).

APPENDIX 1: SAMPLE ITEMS

Domains	Sample items
Service orientation	Above self-interest: A good leader puts the interests of his/her followers above the interests of his/her own. Readiness to serve: A good leader serves others with a genuine heart.
Everyone can be a leader	Everyone can be a leader regardless of his/her current role and position.
Competence	IQ: One of the main qualities of a good leader is to have good analytical skills. EQ: The capacity of managing his/her emotions in a healthy manner is an important quality of a good leader. SQ: A good leader is able to articulate his/her vision of the organization. AQ: Good leaders are able to bounce back from adversity. Passionate about people: Good leaders are people-oriented. Positive social relationship: A good leader maintains positive and healthy relationships with others. Assertiveness: Effective leaders can defend their views while respecting others' feelings and rights. Collaboration: A good leader is able to collaborate with others. Conflict resolution: Effective leaders resolve conflicts in creative and constructive ways. Communication skills: An effective leader effectively communicates his/her thoughts and ideas.
Moral character	Integrity: The overt behavior of a good leader is consistent with his/her inner principles. Fairness: A good leader evaluates followers' performance in an unbiased and objective way. Humility: A good leader accepts criticisms from followers and other people. Role model: A good leader acts as an ethical model for the followers. Belief in the power of morality: A true leader wins trust and respect from the followers by his/her moral virtues.
Caring disposition	Empath: A good leader looks at things from other people's perspective. Compassion: Good leadership requires compassion for other people. Love followers: A good leader extends his/her kindness to others without expecting repayment. Support followers: A good leader helps followers tackle problems that hinder their work progress. Develop followers: A good leader coaches his/her followers for their professional development.
Commitment to continuous improvement	Fixed vs. growth mindset: Leadership competencies can be developed. Self-Leadership: Leaders tend to be highly disciplined. Self-reflection: A leader should closely examine his/her own thoughts and behavior. Freedom vs. determinism: Human beings have the free will to change. Theory X: As most followers do not exercise self-control and self-motivation, leaders must exercise close supervision.

Chapter 122

SERVICE LEADERSHIP EDUCATION IN THE UNIVERSITY OF HONG KONG

***Jessie M. L. Chow**, MSocSc and Samson Tse, PhD**

Faculty of Social Sciences, The University of Hong Kong,
Hong Kong, PR China

ABSTRACT

Substantial research supports the idea that service-learning projects enrich students' leadership skills and nurtures leaders with a sense of social responsibility that is important in the twenty-first century. In view of this, the Faculty of Social Sciences of The University of Hong Kong has initiated the Service Leadership Internship programme to enhance the education of undergraduate students through project-based community service. The programme, which is supported by the Victor and William Fung Foundation, creates authentic platforms for students to work as shared leaders and develop important life skills like collaboration and conflict resolution. This chapter summarizes the learning outcomes of the programme and reflects upon the three-year learning journey. Future directions include the use of cross-disciplinary approaches and extending the programme beyond Hong Kong.

INTRODUCTION

Building the capacity of graduates to fulfill the human resource needs both in the business and the service sectors is increasingly important in higher education [1]. By reviewing the literature, the expert panel from the Horizon Project in 2014 [2] identified six important trends: 1) expanding the use of social media in teaching and learning, 2) engaging students in collaborative learning, 3) using students' data for improving learning outcomes, 4) seeing students as creators, 5) nurturing entrepreneurship in students and faculty, and 6) incorporating online learning. These signify a paradigm shift in higher education away from

* Corresponding Author's Email: jmlchow@hku.hk.

the traditional classroom environment to an interactive learning environment with a great deal of collaboration and social innovation.

Research into leadership education has suggested that experiential learning projects enhance students' leadership skills and nurture future leaders with a sense of social responsibility for the twenty-first century [3, 4]. Internship is one of the most effective experiential-learning pedagogical strategies in higher education. It promotes personal growth and improves the employment prospects of the students [5]. It also features a strong reflection component, onsite supervision, and students' exposure to career-related experiences [6]. About 90% of universities in the United States offer internships or similar experiences to undergraduate students [7].

In view of this, the Faculty of Social Sciences of The University of Hong Kong (HKU) has initiated the Service Leadership Internship (SLI) program. It is a 12-credit course (sponsored by the Victor and William Fung Foundation since 2013) aimed at fostering leadership skills in undergraduate students through a six- to eight-week community-service experiential learning program during the summer [8, 9].

THE OBJECTIVES OF THE SLI PROGRAM: THE HKU APPROACH

In line with the core beliefs underpinning the curriculum framework proposed by the Hong Kong Institute of Service Leadership Management, the SLI program at HKU aims to achieve the following four objectives:

- 1) To strengthen students' sense of the social responsibilities of leadership
- 2) To assist students in acquiring the personal competencies required for leadership, through the enhancement of
 - Self-efficacy and the ability to tackle novel challenges and ill-defined issues
 - Resilience to setbacks
 - Critical thinking and problem solving skills
 - Self-reflection on personal and professional growth
- 3) To help students acquire the social competencies needed in leadership by enhancing their
 - Collective efficacy and team building skills
 - Collaboration and conflict resolution skills
 - Communication skills
- 4) To enable students to hone their leadership skills in authentic services to the community. These skills include
 - Organization and management skills
 - Planning and decision making skills
 - Skills in exerting a positive influence on others

Students' Participation over the Years

The SLI program was launched in the summer of 2012. In its first three years, the program was solely designed for students from the Faculty of Social Sciences and the Faculty of Business and Economics, but is now (as of 2015) open to students from other faculties. This new move allows more students to benefit from the SLI program. Synergy arises from the interactions among students from different backgrounds, which also makes the learning experience more meaningful. The figures below give some of the program's descriptive data.

Figure 1. The total number of community partners since the inception of the SLI program.

Figure 2. The total number of students from various faculties or departments since the inception of the SLI program.

Assessment and Impacts of the Program

Academic deliverables (ongoing participation in an online reflective forum, integrated essay, and a poster conference) have been structured alongside the internship. Students are assessed by their supervisors, academic tutors, peers, and themselves.

Each year an evaluation study of the program's impact on the students' mindsets—and of their gains in social awareness, personal and social competencies, and leadership skills—is conducted. Students have to complete a questionnaire before and after their internship. The

findings are then used to compare the students who joined the regular internship program (without the leadership component) and students who joined the SLI program.

The results in 2014 indicated that, after the internship ($t = 2.33$, $df = 143$, $p = .02$), students who had participated in the SLI program had lower fixed-mindset scores ($M = 3.08$, $SD = .86$) than the students who had participated in the regular internship program ($M = 3.32$, $SD = .89$) (Chow & Lam, 2015). Also, students with a less fixed mindset at the end of the program tended to be more forgiving ($r = -.30$, $p = .02$). They also tended not to attribute minor transgressions by their friends to personal traits ($r = .29$, $p = .02$). Further studies are required to explore the impact of SLI learning experiences on the students, preferably with a larger sample and across more time (over the medium and long term).

The data from a focus-group study conducted in September 2014 revealed that most of the students had very positive learning experiences in the SLI program. Students appreciated the diversity of project selection, the authentic project tasks, and the ample opportunities to apply their innovative social ideas. While some of them may experience challenges in team work, they learn how to adjust and negotiate their expectations and how to work towards common goals under shared leadership.

The SLI program has created an authentic platform for students to contribute through shared leadership and to develop important life skills, such as those needed for collaboration and conflict resolution. It has also enhanced the students' sense of social responsibility and improved the personal and social competencies of the students.

Reflection on the Three-Year Journey

There are four main reflections broadly covering the structure for service leadership and the wider learning environment.

Building the Structure for Service Leadership Education at HKU

The experiential learning approach at HKU is a very powerful and effective way to nurture the leadership skills of undergraduate students. The three-year journey has produced many successful cases involving students changing from a fixed mindset to a growth mindset and moving out of their comfort zone to collaborate and to lead the projects. By successfully completing different service tasks, students built up their confidence for participating in shared leadership and became committed to the betterment of the society in Hong Kong and beyond.

Through employing a wide range of project types with different organizations, we realize that community engagement is an authentic and practical way to nurture leaders with social awareness and to develop a commitment to the social responsibilities of leadership. Students were exposed to a wide range of contexts involving different social issues beyond campus life; as reflective learners, the students needed to integrate their academic knowledge with what they learned from the practical applications of it during the internship.

A team-based approach has been proven to be successful in nurturing shared-leadership skills. Throughout the internship process, students had to work towards common goals. Thus, they had to use their communication skills and collaborative skills at the same time as their problem solving skills.

Coaching is another important element of HKU's service leadership education. We aim to provide continuous, structured support to the students throughout the six- to eight-week internship. The dual supervision approach is critical to the students' learning processes: the supervisors from the community partner provide hands-on feedback to the student interns at the workplace, while the academic tutors from the university provide academic support. Tripartite meetings are conducted at different stages of the project so that students can receive timely feedback.

Co-Learning among Teachers, Intern Students and Community Partners

The teachers continue to reflect on the learning process to support the service leadership education. They add new elements so as to better structure the students' learning processes and achieve better learning outcomes.

In the fourth year of the program, we used social media to support the students' reflective learning process. Instead of submitting a written 1,500-word reflective journal, the students were required to participate in an interactive online forum throughout the internship. The students had to initiate a discussion thread and post a response in three different areas: problem solving, critical incidents, and personal growth and sharing. Although more effort was required for participation in an online discussion forum than for writing a single piece of academic work, the students' feedback regarding the forum was very positive.

We continue to heed students' feedback, which is garnered from various sources, including focus group interviews and self-evaluation data. We also encourage community partners to provide us with feedback regarding our program.

Building an Environment for Active Sharing among Students

Actively contributing to peers' learning processes is an indispensable element of HKU's service leadership education. Throughout the internship, we build in different peer learning and sharing environments at different times, so that students can contribute to others' learning outcomes through shared leadership.

During Week 7, students share in small groups, face-to-face, during the booster session at the HKU campus. In the pre-internship workshops students interact with all their counterparts; in the booster session, students meet with only two to three SLI project groups. They talk about their own difficulties and gather feedback from other students. Most students find this session very useful, as they collect feedback from other students and also receive support from their peers.

Students use the aforementioned online discussion forum as another effective platform for peer support. This is particularly true of the problem-solving area of the forum, where students pose questions regarding their SLI projects. For example, students ask questions related to project design, ask directions for locating different types of resources, and even ask for technical advice on how to use computer software. In the personal growth and sharing area of the forum, students continuously share with others new insights and knowledge. The platform is very effective in boosting team spirit and morale, as students find support in a timely manner and understand that other students also face different kinds of challenges as part of their learning process.

The poster conference at the end of the internship program creates a platform for students to celebrate their achievements. Students in each team decide among themselves who will fill the roles of presenters and assessors at the conference. While the presenters are responsible

for presenting the learning processes and learning outcomes of their SLI projects, the assessors appraise their peers' presentations and ask critical questions. The conference continues to be one of the highlights of HKU's service leadership education as it consolidates the students' learning and provides them with additional feedback.

Cross-Disciplinary Development

We understand that shared leadership is not only about working as a team; future leaders need to be able to work in multi-disciplinary settings too. We intend to extend our internship invitation to other disciplines and will continue to encourage students from different disciplines to work collaboratively in each SLI project. By working with students from different disciplines, individuals learn to understand their own limitations and, at the same time, appreciate inputs from other perspectives.

Another cross-disciplinary development involves the pilot project Glocal Solutions (GS). GS is a cross-disciplinary credit-bearing experiential learning project at the HKU that is aimed at nurturing global leaders who discharge their social responsibilities in diverse cultural settings. Based on a needs analysis of the community, an innovative small scale construction project will be implemented by the students, under the supervision of World Vision Vietnam. Students will work under shared leadership to create a design that will meet the community's needs, while utilizing their academic training (e.g., in social sciences or engineering) and remaining mindful of local constraints on capacity, resources, and time. We will continue our efforts to reach beyond the borders of Hong Kong and adopt a practice-oriented approach—so as to nurture global leaders with social awareness and a strong sense of commitment to global issues—by engaging community partners globally.

FUTURE DIRECTIONS

We are planning five major initiatives which will take place over the next three years.

Experiential Learning

The HKU Service Leadership Education will continue to be built around experiential learning, meaning that we provide leadership education through active experiences of students outside of regular classroom settings. We believe that transformative learning is more effective than informative learning at developing leadership attributes and at enabling students to become change agents [10]. Also, experiential learning provides a very valuable opportunity for students to gain new perspectives on their classroom learnings, so as to address real needs in society [11]. Lastly, it nurtures real and authentic collaborations amongst students, thereby building their teamwork and conflict resolution skills [12] that are critical parts of leadership development.

Cross-Disciplinary Approach

We will open up local Service Leadership Internship to students from other disciplines (e.g., engineering and architecture) and we will approach other Faculty staff to design SLI

projects that are cross-disciplinary in nature. Such cross-disciplinary collaboration in teams simulates real life situations and real work settings [13]. On one hand, this reflects how society actually functions, with work accomplished and achieved by interdependent disciplinary specialists [14]. On the other hand, cross-disciplinary collaboration is now critical to solving pressing global issues. The synergy creates insights and novel solutions to complex global problems [15]. Our students are encouraged to move out of their comfort zones by going beyond the limitations of their own disciplines and learning to approach the problems in a multiple-disciplinary, collaborative fashion.

Service Leadership Beyond the Borders

Students benefit academically, socially and culturally from overseas experiential learning projects [16]. Also, the University has clearly stated in the educational aims that our curriculum aims to develop students' capabilities in six key areas:

- 1) Pursuit of academic/ professional excellence, critical intellectual enquiry and life-long learning
- 2) Tackling novel situations and ill-defined problems
- 3) Critical self-reflection, greater understanding of others, and upholding personal and professional ethics
- 4) Intercultural understanding and global citizenship
- 5) Communication and collaboration
- 6) Leadership and advocacy for the improvement of the human condition (<http://tl.hku.hk/reform>)

In other words, the SLI must reflect the interconnectedness of the world and be aligned with HKU's educational aims and institutional learning objectives. We, therefore, have expanded the SLI program to reach beyond the borders of Hong Kong in order to further develop students' intercultural understanding and global citizenship. This allows our student leaders to develop cross-cultural communication skills [13] that would be otherwise difficult to develop in a local setting. As such, the pilot project Glocal Solutions was launched in summer 2015 and it will be carried on into the future.

Expertise Sharing Forum/Workshops

We aim to promote service leadership education at the university level by collaborating with other departments and also with community partners and organizations. For example, the Gallant Ho Experiential Learning Centre at HKU provides experiential learning support to all undergraduate students at HKU. We will take the opportunity to consolidate the conceptual aspect of service leadership and the teaching pedagogy.

Strengthening Experiential Learning at HKU through Evidence-Based Research

Lastly, the sustainability of the initiative rests with how well we transfer the lessons learnt and experience gained from the SLI program to the HKU's existing experiential learning curriculum. The Experiential Learning team at the Faculty of Social Sciences will: 1) systematically review the past four years' experience in order to identify the critical elements of the learning process (e.g., the enabling factors and barriers, and the roles played by the

different personnel involved in the process) embedded in the SLI program; and 2) make adjustments to the current experiential learning structure (e.g., working in small groups, specific project-based design, and shared leadership) to further improve the students' learning experience.

The Faculty is committed to nurturing global leaders through different types of experiential learning programs. We will continue to engage students from a wide variety of disciplines, as the skills acquired in interdisciplinary teams will be helpful for students in their future endeavours.

ACKNOWLEDGMENTS

The authors would like to express their gratitude to Dr. Lam Shui-fong for all her contribution to the development of the programme throughout the years. The Fung Service Leadership Education initiative and this work were financially supported by the Victor and William Fung Foundation. This chapter is based on a paper published in the *International Journal on Disability and Human Development* 2018;17(1) issue.

INTRODUCTION

In different parts of the world, economies have been changing from an industrial mode to a service mode [1-3]. While industries such as computer and automobile manufacturing still exist in different parts of the world, there is a gradual integration of the traditional industrial production with service provision. Besides differences in production processes between the industrial and service economies (e.g., assembly line production versus production of reliable service), the desired leadership qualities of the two economies are also very different. While desired leadership in the industrial economy is more top-down, it is more bottom-up in the service economy [4].

In the “traditional” leadership models which are closely related to industrial economies, leadership generally focuses on production outcomes and is commonly conceived in terms of leadership competencies, such as effective problem-solving and skills to make wise

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

management decisions. While these attributes are important, their sole existence is not adequate for effective leadership in service economies. As service provision involves both the service provider and the service recipient(s), whether service providers have ethics and moral responsibilities are particularly important because quality control is commonly performed by the service providers (e.g., teachers and brokers). In addition, whether a leader cares about other people, including the service recipients and the followers is an important leadership attribute in service economies. Basically, the mission of a service leader should not be just geared towards maximization of profit without caring about other people's benefits [5, 6].

Because of the changing requirements of effective leaders in service economies, there is a need to nurture leaders with leadership competence, ethics and caring attributes. The notion of "service leadership" was put forward by Po Chung, Co-Founder of DHL International. He argued that effective service leaders should have the attributes of generic leadership competence, moral character and caring disposition (3 Cs). Together with the support from the Victor and William Fung Foundation, Po Chung initiated the Service Leadership Education Initiative where eight Government-funded universities in Hong Kong were given grants to develop curriculum materials on service leadership. To mark the success of this initiative, two international conferences were held in 2014 and 2016, respectively [7, 8].

At The Hong Kong Polytechnic University (PolyU), both credit-bearing subjects and non-credit-bearing programs have been developed since the inception of this initiative. For credit-bearing subjects, a 2-credit subject was developed under the old 3-year undergraduate program and a 3-credit subject entitled "Service Leadership" was developed under the new 4-year undergraduate program. Besides Hong Kong, we also offered the "Service Leadership" subject in Cambodia and Xian in the form of intensive summer course. To promote service leadership attributes among the students, we also designed a service-learning subject to nurture the service leadership qualities among students through serving others. For non-credit-bearing programs, we designed leadership training programs for Wofoo Leaders' Network. We also included the intensive service leadership programs for students from PolyU, Peking University and Xian Jiaotong University.

To understand the impact of service leadership education on the development of students, we have conducted a systematic evaluation for the education programs developed. Primarily, we have used objective outcome evaluation via the one-group pretest-posttest design to assess the changes of the students after they completed the subjects or programs. Basically, there are research findings showing that students had positive changes in terms of improved knowledge, attitude and behavior on service leadership and enhanced well-being. Second, we used subjective outcome evaluation to understand the views of students toward the subject or training program, instructor or trainer, and the perceived benefits. Finally, qualitative evaluation via personal reflection worksheets, individual interviews or focus groups has been conducted to understand students' learning experiences and how they have benefited from the service leadership education. Taken as a whole, previous evaluation studies have demonstrated that service leadership subjects and programs are effective in promoting service leadership qualities and well-being among student participants [9-12].

In this book, we report evaluation findings based on different service leadership subjects and programs. Generally speaking, the reported findings replicated the previous evaluation findings of the Service Leadership Education Initiatives. These findings consistently and strongly suggest that these initiatives can help to promote service leadership attributes in young people. To build up the academic and professional foundation of service leadership

education, these evaluation initiatives are very important. When China is gradually evolving to the service economy, we earnestly hope that young people can be nurtured to be effective service leaders who possess competence, character and care.

Department of Applied Social Sciences,
The Hong Kong Polytechnic University, Hong Kong, PR China

ABSTRACT

In this chapter we assess the changes of students in universities in Hong Kong after studying a 3-credit subject about service leadership in two semesters. A total of 148 undergraduate students studying the subject conducted a questionnaire before and after the study. The questionnaire measures students' positive youth development, satisfaction with life, and qualities related to service leadership. Results revealed that students of both semesters had positive changes in different positive youth development indicators. Students' improvement in life satisfaction and qualities related to service leadership was also found in one semester. Findings of the study offer further support to effectiveness of service leadership subject in nurturing positive development and leadership development of students.

INTRODUCTION

Leaders are essential for the development of a society in any historical stage. Different leadership styles emphasize the cultivation of different characteristics and qualities [1]. Leadership was regarded as a process that a person exerts influence on a group of people to pursue a collective goal [2]. In the industrial time and manufacturing economy, the core activity in economy is mass production of goods or products; the production process is highly

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

standardized; the organizational structure is highly hierarchy; and the workers are treated more as “screws” in a huge machine [3]. Accordingly, the leadership styles are normally autocratic and transactional [3]. In addition, the leadership mainly focuses on leaders’ own professional and task-related competences, that is, the “hard skills” [2, 4].

However, there has been a significant socioeconomic transformation in recent years. One prominent feature of this transformation is the prevalence and dominating of the service economy in the global landscape. According to different research studies and statistics, the service economy has become the major driver of economic development and major contributor of GDP in many countries and districts including the United States [5], countries of the Organization for Economic Co-Operation and Development [6], and Asian Pacific nations or regions [7]. Hong Kong is without exception. During the past two decades, there has been a rapid increase and expansion of service economy in Hong Kong’s economic development. The contribution of service industry to GDP of Hong Kong has increased from 87.3% to 92.2% between 2000 and 2016 [8]. Particularly, Hong Kong’s economic growth is driven by four key service industries including “financial services, tourism, trading and logistics, and professional and producer services,” which contributed to more than half of the GDP of Hong Kong [9]. In recent years, there has been rising of new service industries including medical and educational services, cultural industries, certification services, and innovation and technology, which helps together to shape Hong Kong’s competitive edge in global economic competition [9].

The economic activities, organizational structure, and manpower requirement are very different between manufacturing economy and service economy, so do the required leadership styles. In service-based economy, knowledge creation and service provision are core activities for economic development. The economic inputs are mainly knowledge and skills and the outputs are high-quality and individualized services provided to customers based on customer-producer negotiation and communication [3, 10]. Besides, tasks become highly complex in service-based economy for which leaders cannot make decisions solely by themselves but need shared decision making with their followers and even other stakeholders. Therefore, human assets, human interaction, and social relationship play an essential role in service economy and success of organization [4]. This requires organizational structures to be decentralized and flexible to allow for knowledge storing, sharing, and creation, and to give full support to autonomous and highly motivated workers [3]. This also requires leadership to focus on empowerment, relationship building, motivation, caring, support, and collaboration to maximize contributions of employees in service-based economy [3, 10]. In other words, possessing hard skills is far from enough for being effective leaders. Leaders’ generic competences, morality, character, and disposition of care become vital [11-13].

Envisioning the above mentioned socioeconomic transformation in Hong Kong society and required leadership styles, The Hong Kong Institute of Service Leadership and Management (HKI-SLAM) put forward a concept and related framework of service leadership. Service leadership was conceptualized as “satisfying the needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments” [14]. Besides, the service leadership effectiveness is dependent on three key qualities: care, character, and competence [15]. First, effective leadership requires not only domain-specific competences but also intrapersonal and interpersonal competences that are required for relationship building in service-based economy. Second, effective service leaders should be ethical role models of

their followers. Their moral characters are vital for gaining trust and commitment from their followers. Third, effective service leaders should love their followers, listen to their followers' views, and show empathy to their followers, which is "care" of leadership. As such, Po Chung [14], the co-founder of HKI-SLAM, argued that a successful service leader is a well-prepared, highly motivated, capable, and "on-the-spot socialized entrepreneur who possesses relevant task competencies and is judged by superiors, peers, subordinates, and followers to exhibit appropriate character strengths and a caring social disposition."

Although there are strong needs for service leaders in Hong Kong's society, the existing university education in Hong Kong shows worrying signs regarding students' healthy and holistic development. A body of research suggests that there are higher rates of developmental problems amongst students in Hong Kong universities. For instance, different studies suggest that Hong Kong university students may experience from moderate to high level of mental health problems such as stress, depressive symptoms, and anxiety [16]. Besides, employer surveys suggest that local employers were dissatisfied with the generic qualities of university graduates particularly for their interpersonal communication skills and psychological maturity [17]. One reason might be that the traditional three-year undergraduate education system overemphasized on specialized education and neglected students' holistic development [17, 18]. As such, it is imperative to nurture university students' holistic development including the development of soft skills and leadership qualities required by the service-based economy and society in Hong Kong.

In recent years, the university education of Hong Kong has experienced significant changes as a response to current socioeconomic change. Particularly, the three-year undergraduate education curriculum has been transformed to a four-year one since the 2012/13 academic year, with one additional year being devoted mainly to general education and students' holistic development [18]. Along with this transformation, there is an increasing awareness of leadership development among university students. Particularly, since 2012, the HKI-SLAM has collaborated with Victor and William Fung Foundation to launch the Li and Fung Service Leadership Initiative to fund the eight universities under the University Grants Committee (UGC) of Hong Kong to develop programs to nurture students' service leadership qualities [19].

Under this initiative, all the eight UGC-fund universities developed their own leadership programs according to the service leadership framework proposed by HKI-SLAM [20-22]. Among these programs, a prominent one was the "Service Leadership" (SL) subject developed by The Hong Kong Polytechnic University (PolyU). The SL subject is a credit-bearing (3 credits) subject developed combining the HKI-SLAM framework of service leadership with theories of positive youth development. It aims at fostering positive development of students as well as nurturing their related qualities of service leadership [23]. The subject content consists of 12 lectures on topics and qualities related to service leadership and positive youth developments [23]. Specifically, the content centers on leadership competences such as competences in intrapersonal and interpersonal dimensions, strength in character, and disposition of care [24]. Besides, an active and experiential-learning based pedagogy is adopted. Each lecture is delivered through combination of lecturing, group activities (such as group debate, discussion, and drawing), and class activities (such as personal reflection and sharing). With regard to the assessment, multiple assessment methods are adopted including group project, individual term paper, and class participation. The

subject has been implemented at PolyU in different semesters since the 2012/13 academic year as a subject of general education for undergraduate students.

Evaluation is one necessary component for a high-quality educational program. It helps not only assess subject outcomes but also identify possible rooms for further improvement. As such, evidence-based evaluation studies based on different methods were regularly conducted in 2012/13 – 2014/15 academic years as an integral component to monitor the implementation and examine the effectiveness of the SL subject. These methods included quasi-experimental design [25], students' subjective evaluation of the subject content and teaching [26], as well as qualitative evaluation methods such as individual interview and focus group [27]. In general, these evaluation studies revealed positive impacts of SL subject on students as well as students' positive perceptions of the subject [4, 13, 23]. For example, Shek, Yu, and Ma [25] conducted an objective outcome evaluation on a two-credit SL subject (a pilot subject of the three-credit SL subject) offered in the 2012/13 academic year based on quasi-experimental design. They found that students gained significant improvement in several positive youth development indicators such as behavioral and moral competences, and in overall service leadership qualities [25]. A qualitative evaluation study was also conducted on the same subject in the same academic year which illustrated that most students studying the subject used positive descriptors and/or metaphors to illustrate their experiences in the subject [28]. In addition, a subjective outcome evaluation was performed on the SL subject offered in the 2013/14 academic year, which found that most of the students had positive views of the subject content, teaching, and benefits to their development [13].

Although these existing evaluation studies suggest the effectiveness of the subject, they were still inadequate due to the following reasons. First, the existent evaluation studies mostly focused on evaluating the SL subject in its early years of implementation, i.e., from 2012/13 to 2014/15 [12, 25]. Few studies have been conducted to evaluate the subject after 2014/15 academic years. As evaluation is an integral and necessary component in program implementation, evaluation studies should be conducted in each academic year to ensure the smooth implementation and assess effects of the SL subject. Second, most of the existing studies adopted methods of subjective outcome evaluation or qualitative evaluation, few studies adopted pretest-posttest design to examine the subject impact. Although the existing few objective outcome evaluation studies suggest the positive impact of the subject on student positive development and development of service leadership qualities, the findings should be replicated by further evaluation studies based on the same methods.

Against the aforementioned background, this study aimed to examine the effectiveness of the SL subject at PolyU offered in the 2015/16 academic year. The study adopted the method of a single-group pretest-posttest design, which was widely adopted in educational, psychological, clinical, and evaluation fields [29-31]. Although it was criticized as having relatively weak internal validity, the method has its own value. For example, it can be used when there is a high difficulty to carry out control groups due to practical or ethical reasons [32]. In addition, it can also be used when the time span between pre- and post-tests is short to allow less influence of other confounding factors [32]. Considering it is difficult to find randomly assigned control and experimental groups in university settings and the pre- and post-test time span is short (one semester) for this study, the single-group pre- and post-test design was employed to assess the changes of students in positive developmental indicators after studying the SL subject.

OUR STUDY

The participants were 148 undergraduate students taking Service Leadership (SL) subject in either Semester 1 (S1) or Semester 3 (S3) of the 2015/16 academic year at PolyU. Among these students, 52 took SL subject in S1 and 96 took the subject in S3. Around one half (51.9%) of the participants in S1 group were female, while around one third (32.3%) of the participants in S3 group were female. The participants' mean age was 19.9 ± 2.30 years in S1 group and 23.7 ± 4.30 years in S3 group, respectively. Table 1 shows detailed demographic information of the participants.

In S1 and S3 of the 2015/16 academic year, all students taking the SL subject were invited to fill in a paper-and-pencil survey questionnaire at the first and the last lectures of the subject. In S1 group, 91 and 52 questionnaires were collected at pre- and post-tests, respectively. Fifty-two questionnaires were matched successfully. In S3 group, 96 questionnaires were matched successfully between 101 and 96 questionnaires collected respectively at pre- and post-tests.

Instruments

The survey questionnaire consisted of 70 items measuring demographic features of the participants and their performance in three constructs including Chinese Positive Youth Development Scale (CPYDS), Satisfaction with Life Scale (SWLS), and Service Leadership Scale (SLS). Description of the three measures is presented as below.

Chinese Positive Youth Development Scale (CPYDS)

The CPYDS attempts to measure the optimistic growth of Chinese adolescents [33]. It consists of 15 subscales, among which 10 were adopted in the study being indicators of students' positive development. The 10 subscales include "Social Competence" (SC, 3 items), "Emotional Competence" (EC, 3 items), "Cognitive Competence" (CC, 4 items), "Behavioral Competence" (BC, 2 items), "Moral Competence" (MC, 4 items), "Self-Determination" (SD, 3 items), "Clear and Positive Identity" (CPI, 2 items), "Belief in the Future" (BF, 3 items), "Spirituality" (SP, 4 items), and "Resilience" (RE, 3 items). All items are rated on a 6-point Likert scale (1 = "Strongly disagree" to 6 = "Strongly agree"). Three composite scores, i.e., "Cognitive-Behavioral Competencies" (CBC), "Positive Identity" (PI), and "Positive Youth Development Qualities" (PYDQ) are further computed based on the 10 subscales. CBC is composed of "Cognitive Competence," "Behavioral Competence," and "Self-Determination." PI includes "Clear and Positive Identity" and "Belief in the Future." PYDQ contains "Social Competence," "Emotional Competence," "Moral Competence," "Spirituality," and "Resilience." Previous studies reported that CPYDS had favorable psychometric properties [33]. The Cronbach alpha of CPYDS ranged from .90 to .92 in the present study, indicating excellent reliability of the measure.

Satisfaction with Life Scale (SWLS)

SWLS contains five items to assess people's overall judgement of their quality of life [34]. This study used the translated Chinese version of the scale which was revealed to

possess good reliability in previous research studies [35, 36]. All items are rated on a 6-point Likert (1 = “Strongly disagree” to 6 = “Strongly agree”). A higher score shows a higher degree of satisfaction with life. The Cronbach alpha of the scale ranged from .86 to .90 in the present study, which indicates good reliability.

Service Leadership Scale (SLS)

Referring to the HKI-SLAM framework of service leadership, the present study used four indicators to assess service leadership related qualities. The four indicators are “Self-Leadership” (SL, 5 items), “Caring Disposition” (CD, 8 items), “Character Strength” (CS, 15 items), and “Belief and Values of Service Leadership” (BVSL, 6 items) [25]. All items are rated on a 6-point Likert scale (1 = “Strongly disagree” to 6 = “Strongly agree”). Different subscales of service leadership quality all demonstrated good reliability in previous studies [25]. The Cronbach alphas of these subscales ranged from .92 to .94 in the present study, revealing high reliability of the measures.

Data Analyses

First, we analyzed demographic statistics of the participants (see Table 1). Second, we computed reliability test for each scale and subscale of the questionnaire. Third, we performed repeated measures MANOVA to assess the participants’ change in indicators of PYD, satisfaction with life, and qualities of service leadership with time (pre- and post-tests) being independent variable. Specifically, we performed multivariate analyses for the whole sample, S1 group, and S3 group, respectively.

Table 1. Demographic information of the participants

		Semester 1 (S1)		Semester 3 (S3)		Whole Sample	
		N	%	N	%	N	%
Gender	Male	24	46.2%	61	63.5%	85	57.4%
	Female	27	51.9%	31	32.3%	58	39.2%
	Did not indicate	1	1.9%	4	4.2%	5	3.4%
Age	Total	52		96		148	
	Mean	19.90		23.70		22.35	
	SD	2.32		4.27		4.11	

FINDINGS

Table 2 shows results of the repeated measures MANOVA on the overall effects of the SL subject offered in S1 and S3 of the 2015/16 academic year. The multivariate effect of time on the 10 subscales of CPYDS was statistically significant, $F(10, 136) = 4.58, p < .001$, partial eta squared = .25. Besides, multivariate effect of time on the three higher order factors of CPYDS was also found to be significant, $F(3, 143) = 5.19, p < .01$, partial eta squared = .10. Regarding the univariate effects of time, there was significant increase in participants’ scores on SC, EC, CC, BC, and CPI ($p < .01$ for EC, $p < .001$ for CC and CPI, and $p = .001$ for SC and BC), while the participants’ scores on MC, SD, BF, SP, and RE remained stable.

Regarding the univariate effects of time on the three higher order factors, the participants' scores for CBC, PI, and PYDQ all had significant increase ($p < .001$ for CBC, $p < .01$ for PI, $p < .05$ for PYDQ).

The participants also had significant increase in their score of SWLS, $F(1, 146) = 8.44$, $p < .01$, partial eta squared = .06. Regarding SLS, a multivariate effect of time was also found, $F(4, 144) = 2.66$, $p < .05$, partial eta squared = .07. For univariate effects, three subscales (i.e., SL, CD, and CS) of SLS showed significant increase ($p < .05$ for SL and CD, $p < .01$ for CS) between pre- and post-tests. The fourth subscale, BVSL, also demonstrated marginalized significant increase ($p = .055$).

Effects of the Subject in S1

Repeated measures MANOVA was also conducted separately to the participants in S1 group to identify effects of the SL subject offered in S1. The results are shown in table 3. Regarding the CPYDS, although there was no significant multivariate effect of time on the 10 subscales, the multivariate effect was found on the three higher order factors, $F(3, 48) = 3.18$, $p < .05$, partial eta squared = .17. The results of univariate effect revealed that the participants increased significantly in scores of CC ($p < .001$), BC ($p < .05$), and one higher order factor CBC ($p < .01$), while they did not change significantly in scores of other subscales and higher order factors. There was no significant multivariate effect of time on the participants' score on SWLS and SLS. Univariate effect tests showed that the participants increased significantly in the score of SL ($p < .05$) and CS ($p = .05$), while they remained stable in scores of BVSL.

Effects of the Subject in S3

A significant multivariate effect of time on the 10 subscales of CPYDS was found based on repeated measures MANOVA, $F(10, 85) = 3.89$, $p < .001$, partial eta squared = .31, and on the three higher-order factors of CPYDS, $F(3, 92) = 4.10$, $p < .01$, partial eta squared = .12. Univariate effect tests showed that the participants increased significantly in scores of SC, EC, CC, BC, and CPI ($p < .001$ for SC and CPI, and $p < .01$ for EC, CC, and BC) and in scores of all three higher-order factors ($p < .01$ for CBC, $p = .001$ for PI, and $p < .05$ for PYDQ). The participants' score of SWLS was also significantly increased between pre- and post-tests, $F(1, 94) = 7.79$, $p < .01$, partial eta squared = .08. Although no significant multivariate effect of time was found on SLS, univariate effect tests showed that the participants' score on CD ($p = .046$) has increased significantly between pre- and post-tests.

DISCUSSION

This study assessed the impact of SL subject offered in two semesters of the 2015/16 academic year at PolyU through a single group pretest-posttest design. Students' improvements in a set of positive youth developmental indicators, satisfaction with life, and qualities related to service leadership were assessed. In general, the results revealed that the students gained significant improvement in positive youth development in general and some of its specific indicators, their satisfaction with life, and qualities related to service leadership after taking the subject. This indicates that the subject offered in the 2015/16 academic year was effective in fostering students' positive development, wellbeing, and development of qualities of service leadership.

The results are consistent with the findings of existing evaluative studies on the subject offered in previous academic years. For example, Shek, Yu, and Ma [25] evaluated a 2-credit SL subject (a piloted version of the 3-credit SL subject at PolyU) offered in early years based on objective outcome evaluation method. They found that students had positive changes in general positive youth development and some of its specific indicators, as well as in overall service leadership qualities. In another study objectively evaluating an intensive (3.5-day in length) SL subject offered to students in mainland China, it was found that the subject promoted students' development in most of the constructs indicating youth's positive development, satisfaction with life, and qualities related to service leadership [37]. While these previous studies provided evidence about the effectiveness of SL subject, they were either based on a piloted version or an adapted version for students outside of Hong Kong. These findings added strong evidence to the fact that SL subject is an effective program for promoting university students' positive, holistic, and service leadership development. It also suggests the quality implementation of the subject in different academic years.

Several specific observations deserve attention. First, univariate effects found that the participants gained significant improvement in most of the measured competences including social, emotional, cognitive, and behavioral competences, as well as their positive identity. This indicates that the subject is particularly useful in promoting students' development in these aspects. Social competence refers to interpersonal and social skills. Emotional competence refers to one's awareness of and abilities to manage emotions of oneself, and to understand and respond to others' emotions [38]. Cognitive competence means an individual's cognitive abilities such as logical and critical thinking. Behavioral competence refers to the ability of utilizing different strategies to shape socially desirable behaviors in social interactions and to make appropriate behavioral choice [39]. These different aspects of competences are vital to student development and are related to a set of positive developmental outcomes such as self-esteem [40], positive coping [41], and increased psychological wellbeing [42]. They were also negatively associated with a set of youth developmental problems such as internalizing and externalizing behaviors [43], depression [40] and substance abuse [44]. These competences were also important qualities for effective leadership development as shown by literature [45, 46]. Therefore, students' improvement in these positive development indicators indicates that SL subject is particularly useful and effective in promoting students' multi-facet and holistic competences.

Second, results indicate that SL subject is also effective in promoting students' subjective wellbeing indicated by life satisfaction. Life satisfaction means people's global evaluation

and perception of their quality of life as a whole [47]. It is regarded as an important psychological strength based on positive psychology [48]. Adolescents and university students with higher life satisfaction would have better psychosocial functioning [49], higher self-esteem [50], and better self-perceived health status [51]. They were also less likely to develop problem behaviors [52] and have reduced level of anxiety and depression [53]. As research revealed that adolescents in Hong Kong perceived lower-level satisfaction with life compared with US adolescents [54], it is necessary to promote adolescents and university students' life satisfaction to build up their strengths. Based on this, the results of the present study can help to show that SL subject could be one important mean or intervention strategy to help to elevate students' life satisfaction.

Third, students' service leadership qualities were promoted through studying the SL subject. This is important since that one of the major purposes of the subject is to foster students' development in important qualities related to service leadership including generic competences, morality, and disposition of care according to positive youth development theory and framework of service leadership put forward by HKI-SLAM [55]. As service leadership is an important quality that is highly needed for manpower in Hong Kong's economic and social development, the findings indicate that the SL subject can promote the required key service leadership qualities needed by the society. It also indicates that leadership knowledge, attitudes, and skills can be taught and nurtured through effective educational programs.

With regard to the result that students did not have change in some constructs such as "Moral Competence," "Self-Determination," "Spirituality," and "Resilience," this might be explained by several reasons. First, the effect of educational program on some developmental indicators such as morality and spirituality might take longer time to show. Second, the development of some qualities might also need more practice, life experience, and self-reflection in later life. It is hard to show significant improvement of students in these indicators in just one semester time. Third, although a lot of interactive, reflective, and experiential learning activities are integrated in the SL subject, the teaching of the subject still needs to be continuously examined and improved to further enhance the effectiveness of the subject in promoting these developmental indicators.

Moreover, the separated analyses on students' changes in S1 and S3 groups showed that students in S3 group gained more positive improvement than students in S1 group. This might be due to the reason that the intensive-teaching-and-learning design might be more effective compared to the normal design of the subject as students may have more intensive time to be engaged in and reflect on their learning. This is also supported by the results of previous studies that the intensive SL subject offered in mainland China had much positive impact on students' development of all the indicators [37]. Further studies need to be conducted to understand more about this issue. Of course, this is important to further examine the sustainability of the positive effects observed in the study.

This study had several limitations. First, although pre- and post-test design can help identify students' changes before and after studying the service leadership subject, students' improvement might also be influenced by their naturally maturing factors. Therefore, future studies should be conducted by adding control groups to better determine students' changes under the impact of SL subject. Second, as mentioned earlier, development of some indicators might need time, practice, and integration of experience; therefore, future studies might follow up with the students for a period of time after taking the subject to identify long-term

effects of the subject on student development. Third, as objective outcome evaluation method can only identify effectiveness of the subject but not the subjective viewpoints and feedbacks of different stakeholders to the subject, future studies may adopt both objective and subjective outcome evaluation methods to form a more comprehensive understanding of the effects of the SL subject and give more valuable suggestions to its further improvement. Fourth, to evaluate the effectiveness of the subject in a more vigorous approach, scholars developed validated measures to assess students' knowledge about service leadership, their attitudes towards service leadership, as well as their behaviors related to service leadership [56-58]. It is valuable and important to utilize these measures in the objective outcome evaluation to assess students' changes in knowledge, attitude, and behavior of service leadership to provide more evidence on effectiveness of the subject in future. Last but not the least, as previous research suggests an association between positive youth development and life satisfaction [52], it is worth to further examine the association between students' change in life satisfaction and PYD across studying the subject to further understanding of the impact of the subject.

Despite of the above limitations, this study provides significant evidence about the effectiveness of service leadership subject at PolyU, which is vital for continuous improvement and sustainable development of the subject.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. Chapter 125

**PROMOTION OF WELL-BEING AND LEADERSHIP
QUALITIES AMONG UNIVERSITY STUDENTS
AFTER TAKING A CREDIT-BEARING SERVICE
LEADERSHIP SUBJECT**

ABSTRACT

With the increasing development of service economies, service leadership (SL) concepts and educational programs have been advocated in Hong Kong. To assess the impact of SL education initiative, the current chapter evaluated changes in SL attributes and well-being in 88 students after completing a credit-bearing General Education subject entitled “Service Leadership” at The Hong Kong Polytechnic University in 2017/18 academic year. Through a one-group pretest-posttest methodology, the research showed that students had positive changes in SL qualities indicated by “self-leadership,” “character strength,” “caring disposition,” and “SL beliefs” as well as personal well-being indexed by “life satisfaction” and “positive youth development.” This research also found that changes in SL qualities and well-being were positively correlated with each other. Our findings suggest that it is promising to nurture SL attributes and foster well-being among university students through formal leadership curriculum.

INTRODUCTION

The world has stepped into a post-industrial era featured with the rapid development of new technologies and strong emphasis on knowledge, service, and human capital. Service sectors have occupied a much bigger share than manufacturing industries in some developed regions, such as the United States, the United Kingdom, and Hong Kong. For instance, in Hong Kong, the value added by service sectors in GPD (“gross domestic product”) has been over 92.0% since 2015 [1]. Developing countries, such as China and India, have also been paying more attention in service-sector-related fields, such as finance, in order to survive and thrive in the increasingly fierce global competition [2]. In mainland China, the service sector contributed to 52.2% of the GDP in 2018, compared to 41.2% of the GDP in 2004 [3]. The industrial era witnessed machines replacing human laboring which promoted productivity and efficiency. The post-industrial era, however, has a higher level of technological support as well as human resources contribution to service, creativity and other related fields, such as trades, finance, and technologies [1]. Obviously, one should ask what the desired leadership qualities are under service economies which emphasize human capital, particularly soft skills of the workers.

Characterized by empowerment, innovation, and creativity, the service economy calls for organizational changes and re-definition of youth leadership [4]. Therefore, holistic leadership qualities have been much stressed across the globe in the 21st century, as the society needs the younger generations to be equipped with integrative competencies including not only “hard skills” (e.g., professional knowledge), but also “soft skills,” such as “creativity and innovation,” “communication and collaboration,” “social and cultural skills,” and “critical thinking” [5]. In fact, employers now require university graduates to have these “soft skills” as one of the entry-level requirements [6]. In addition, some scholars proposed the “Service Leadership Theory” which specifies that effective “service leaders” in the contemporary service era need to possess three “Cs,” which denote “Competence,” “Character,” and “Care” [4]. This perspective of whole-person development should be kept in mind in providing leadership education for university students. However, such leadership training is far from sufficient in the context of higher education and to some extent, university graduates have failed to meet the requirements of being an effective “service leader.” The gap between the society’s demanding needs for university students’ service leadership (SL) qualities and their actual performance awaits to be urgently bridged.

Shouldering social responsibilities is one of the missions and visions of higher education institutes. Through education and research, making contributions to the society has been a tradition of universities which can be traced back to the establishment of University of Oxford and University of Cambridge, two of the oldest universities in the world. After hundreds of years, the mission and vision of contributing to “society through the pursuit of education, learning and research at the highest international levels of excellence” [7] and “benefit society on a local, regional, national and global scale” [8] are still included in the core values of the two universities for future development. In today’s rapidly transitioning world of the service economy, higher education plays an even more active role in sustaining societal development by continuingly fostering research and raising up future service leaders. For instance, Dugan and Komives [9] stated that “the education and development of students as leaders has long served as a central purpose for institutions of higher education” and leadership is “a critical

college outcome” (p. 8). Unfortunately, there are increasing voices criticizing that contemporary universities focus too much on ranking and student achievements without paying due attention to the holistic development of students.

To nurture youth leadership, both “hard skills” and “soft skills” need to be stressed, especially “soft skills” that are hugely emphasized in the service era but are somehow overlooked in the contemporary leadership education. Traditionally, when talking about leadership, people would think of leaders “doing things right” and leadership training accordingly focused mainly on hard skills and elitism, such as management skills and decision-making skills. As of today, comprehensive and effective leadership education proposes to train leadership in “knowing” (leadership knowledge), “being” (mindset, service orientation, character, and care) and “doing” (leadership skills) [4]. Such leadership education not only teaches young people how to “do things right,” but also to “do the right things.” This mode of leadership education has been proved to be effective in nurturing youth leaders in previous research. Students obtained significant growth in civic responsibility, personal and societal values, and holistic development [9-11]. A notable example is SL education guided by the “Service Leadership Theory” in Hong Kong [12]. The implementation of SL education highlighted “the importance of caring disposition and moral character in addition to competencies” (p. 97), and in practice efficiently deepened participating university students’ knowledge of SL and fostered their SL qualities [13].

As the name suggests, the concept of SL stresses service and leadership and refers to “ethically satisfying the needs of self, others, groups, communities, systems, and environments” [14]. In contrast to traditional leadership thoughts that are pertinent to elite leadership and leading others, SL notions manifest in stressing service orientation and equally emphasizing the development of competences, ethics and morality, and caring disposition (i.e., the 3Cs) [4, 12]. In addition, the SL proposition believes in young people’s strengths and potentials, thus it holds the belief that “every day, everywhere, everyone can take a leading role” [15]. To apply these SL concepts into practice, the “Hong Kong Institute of Service Leadership and Management” (HKI-SLAM) developed SL curriculum materials and initiated a SL education schema in eight government-funded universities in Hong Kong in 2012.

As one of the participating universities in the scheme, The Hong Kong Polytechnic University (hereafter PolyU) provided students with both credit-bearing General Education subjects (i.e., “Service Leadership” subject) and non-credit-bearing SL training programs since 2012/13 academic year. The SL education at PolyU aims to nurture leaders who possess leadership competencies, demonstrate concern, empathy, and sincerity to others, listen to and care for others’ needs, and show positive ethical traits. These intentions echo the core values of SL propositions that “leadership is service” and “everyone can be a leader” by serving [4]. To ensure the effectiveness of the SL education, course curriculum was rigorously developed and reviewed by the research team and instructors were well-trained to better deliver course materials. Specifically, the core concept of the course is the beliefs of SL, the importance of generic competencies, morality and caring disposition, and application of SL concepts in daily life and career development [16]. Furthermore, multiple teaching methods are used in the course to better engage students in active learning, such as the experiential teaching and learning pedagogy, reflective and collaborative learning. This provides more opportunities for students to be engaged in experiential learning emphasizing the importance of reflective learning, collaborative learning, and self-leadership. Previous research has demonstrated that

these teaching and learning approaches can effectively promote student engagement and deep learning [17, 18].

Theoretically, SL is an innovative concept. Practically, SL education has been well received by students and proved to be effective and fruitful in promoting student development. After years of implementation in Hong Kong, both qualitative and quantitative evaluation studies revealed positive perceptions held by teachers and students toward the implementation. They claimed significant positive changes among participating students in terms of leadership development and healthy functioning [19, 20]. Comparisons between student conditions before and after receiving the education revealed positive changes happened among the participants. For example, Shek, Yu and Ma [21] used a pre- and post-test method to analyze the effectiveness of the credit-bearing “Service Leadership” subject offered to students in 2012/13 academic year at PolyU. They found that the students who participated in the course displayed higher SL qualities, such as ethical attributes, after the completion of the course.

In addition, Shek and Lin [22] did pretest, immediate posttest, and follow-up test to examine the effectiveness of a 12-day intensive “Service Leadership” course as an academic component of a leadership training program jointly launched by PolyU and a university in Mainland China. The results suggested that the course effectively promoted students’ qualities and beliefs of SL as well as well-being. Similar positive findings were reported in Shek, Lin, Leung, and Zhu’s [22] study which analyzed student changes after taking another intensive SL course. Their findings further demonstrated the sustainable positive effects of the course as the authors put “students scored much higher on all indicators in the follow-up test than in the pre-test” (p. 69). Because of the positive impact, SL initiatives have won several teaching awards. In 2016, the subject entitled “Service Leadership” won the “Bronze Award (Ethical Leadership)” and the subject entitled “Service Leadership through Serving Children and Families with Special Needs” won the “Bronze Award (Social Enterprise)” in the “QS Reimagine Education Awards 2016” which was regarded as the “Oscar in Education.”

Despite the positive evaluation findings in previous studies, it is also necessary to further examine the beneficial influences of SL education in a continuous manner. Thus, the first research purpose of the current study is to replicate previous positive evaluation findings and unveil the effectiveness of the “Service Leadership” subject delivered in 2017/18 year at PolyU. To do it, this study analyzed student changes after they completed the course in the aspects of SL qualities and values, as well as well-being. In the realm of science, replication is always an important benchmark to evaluate stability of the findings. Besides, although previous evidence has demonstrated that SL education can foster student well-being, the underlying mechanisms contributing to such benefits remain unclear. Existing evidence showed that individuals’ well-being was linked to their leadership qualities [e.g., 23, 24]. Theoretically, it makes sense to expect that student attainment in SL qualities would promote their well-being. One possible explanation is that students’ positive learning experience and their personal development after learning enables students to have more positive feelings toward themselves and gain a sense of accomplishment and well-functioning [25]. Testing this possibility constitutes the second purpose of this study. Specifically, we explored whether student development of SL attributes and improvement in well-being are related to each other.

To achieve the above-mentioned two research purposes, this study utilized a “one-group pretest-posttest” methodology (also called “single-group pretest-posttest”). Although this methodology has some limitations because of the lack of a control group for comparison, Thyer [26] commented that it is a valuable strategy in the field of human services as a pre-

experimental design. To have a control group in an evaluation study helps exclude the effects of confounding factors such as maturation through comparing the experimental group and the control group. However, in practice, especially in the education field, it is not always applicable to have a control group concerning costs and sometimes ethical factors as well as its demanding requirements for administrative manpower and advanced research training in teachers. This is why McCall et al. [27] once asserted that conducting experimental evaluation research is “extremely difficult and often impossible” (p. 982). In this regard, one-group pretest-posttest design is a practical and cost-effective way to investigate outcomes of educational programs [28].

This evaluation methodology has been widely used in social science research fields, such as therapeutic service and education. For example, Williams, Poulsen, Chaguturu, Tobia, & Palmeri [29] used the one-group pretest-posttest methodology to evaluate an online training course which taught psychiatry residents about TUD (i.e., tobacco use disorder). Another example of the usage of this design is a research on the effectiveness of a training program called “Pakistani Educators’ Instructional Leadership Institute (PEILI),” which attempted to help educators in Pakistan acquire new professional knowledge and skills and build new supporting networks [30]. In our study, participating students filled out the same questionnaire before the first lecture of the “Service Leadership” subject (i.e., pretest) and after the last lecture (i.e., posttest). By comparing and analyzing the data collected from the pretest and posttest, the changes happened to the students after taking the course and the effectiveness of the SL education could be revealed.

OUR STUDY

Data used in this study were collected from students enrolled in the “Service Leadership” subject that was offered at PolyU in the first semester of the academic year of 2017/18. At the beginning of the first lecture in the first week, students were invited to fill out the pretest questionnaire forms. Upon the completion of the last lecture in the thirteenth week, students responded to the same questionnaire forms as the posttest. In both occasions of the test, participants were well informed of the data collection principles, such as the principle of anonymity and the usage of data provided by them for educational and research purpose without revealing any personal information in the reports or articles. Each participating student signed a written consent form before doing the pretest. Enough time was given to the participants during both pretest and posttest in filling out the questionnaire in a paper-and-pencil manner.

A total of 88 students completed both pretest and posttest. There were 33 (37.9%) male students and 54 (62.1%) female students and one participant did not report gender information. The average age of the participants was 20.6 ± 2.53 years old. Specifically, most participants were at the early twenties and aged between 19 and 22 years old (e.g., 6 participants aged below 18 years old while 4 aged above 23 years old). More details are depicted in Table 1.

Table 1. Demographic information of participants ($n = 88$)

Demographic variables	Frequency	Valid Percent (%)
Gender		
Male	33	37.9
Female	54	62.1
Age		
18 or below	6	6.8
19-year-old	17	19.3
20-year-old	29	33.0
21-year-old	21	23.9
22-year-old	11	12.5
23 or above	4	4.4
Mean age = 20.6 ± 2.53		

Instruments

The questionnaire used in the study included two outcome indicators: “well-being” and “SL qualities and beliefs,” Subjective and psychological well-being were assessed as two forms of well-being. To index subjective well-being, we measured life satisfaction which is pertinent to an individual’s cognitive appraisal of his or her overall life qualities. Positive youth development (PYD) was measured as an index of psychological well-being reflecting young people’s adequate and healthy functioning [31]. SL qualities were assessed by three subscales including “self-leadership,” “character strength,” and “caring disposition,” which were considered important for leadership effectiveness in the service era [21]. Values and beliefs held by students toward SL were also measured through a subscale. These four subscales related to qualities and beliefs of SL have been used in previous evaluation studies and showed good reliability [21, 22].

Assessment of Life Satisfaction (LS)

LS was measured by “Satisfaction with Life Scale” (SWLS) on a 6-point scale (“1” = “strongly disagree,” “6” = “strongly agree”) with a higher score representing higher LS. SWLS was designed to measure individuals’ perceptions of the qualities of their lives from a subjective point of view [32]. This scale has been widely used in youth development studies in Chinese contexts with a translated and validated Chinese version [22, 33]. The scale included five items, such as “I am satisfied with my life” and “so far I have got the important thing I want in life.” The level of LS was operationalized as the mean score of the five items. The Cronbach’s alpha coefficients of scale in the present study were .87 in both the pretest and posttest, indicating that the scale had good internal consistency (see Table 2).

Assessment of PYD

PYD attributes were measured by the “Chinese Positive Youth Development Scale” (CPYDS) on a 6-point scale (“1” = “strongly disagree,” “6” = “strongly agree”). CPYDS was developed as an objective measurement tool on “growth, cultivation, and nurturance of developmental assets, abilities, and potentials” in Chinese youths by taking into account both

PYD studies conducted in the Western context and features of Chinese culture [34].

Table 2. Outcome changes between pre-test and post-test (N = 88)

	Pre-test		Post-test		<i>F</i>	η^2_p
	<i>Mean (SD)</i>	α	<i>Mean (SD)</i>	α		
Higher-order PYD factors					3.43 [△]	.108
Cognitive-behavioral competencies	4.48 (.49)	.80	4.63 (.51)	.83	7.39 ^{**}	.078
Positive identity	4.41 (.65)	.79	4.59(.61)	.79	8.57 ^{**}	.090
General PYD qualities	4.55 (.50)	.87	4.63 (.46)	.83	4.17 [*]	.046
Total PYD	4.50 (.46)	.92	4.63 (.45)	.91	9.17 ^{**}	.095
Life satisfaction	4.03 (.85)	.87	4.18 (.81)	.87	3.70 [†]	.041
Service leadership qualities and beliefs					3.24 [△]	.134
Self-leadership	4.48 (.54)	.72	4.60 (.57)	.76	4.75 [*]	.052
Character strength	4.50 (.47)	.83	4.58 (.45)	.83	4.73 [*]	.052
Caring disposition	4.75 (.51)	.86	4.86 (.51)	.87	5.67 [*]	.061
Beliefs of service leadership	4.72 (.64)	.86	4.98 (.62)	.91	10.73 ^{**}	.110

Note. [†] $p < .10$; ^{*} $p < .05$; ^{**} $p < .01$; ^{***} $p < .001$. PYD = positive youth development. [△] Adjusted Bonferroni value = .013.

In this study, concerning the “Service Leadership” subject features, 10 out of 15 subscales included in the original CPYDS was utilized to measure ten PYD attributes (e.g., “cognitive competence,” “behavioral competence,” “clear and positive identity” and “moral competence,” etc.) [13]. Based on these subscales (thirty-one items), three higher-order factors including “cognitive-behavioral competencies” (CBC), “positive identity” (PI), and “general PYD qualities” (GPYD) were calculated to index PYD attributes. Specifically, CBC was comprised of three subscales: “cognitive competence” (4 items, e.g., “I know how to see things from different angles” and “I know how to find the causes of and solutions to a problem,” etc.), “behavioral competence” (2 items, e.g., “I can face criticisms with an open mind” and “I can express views that are different from others”), and “self-determination” (3 items, e.g., “I am capable of making wise choices” and “I believe things that will happen in my life are mostly determined by myself”). PI consisted of two subscales including “clear and positive identity” (2 items, e.g., “I am a person with self-confidence” and “I believe I have the qualities and abilities of a leader”) and “belief in the future” (3 items, e.g., “I have confidence to solve my future problems” and “I have confidence that I will be a useful person after I graduate”). GPYD included five subscales: “social competence” (3 items, e.g., “I know how to communicate with others” and “I understand the rules and expectations when interacting with others”), “emotional competence,” (3 items, e.g., “when I am unhappy, I can appropriately express my emotions” and “when I have a conflict with others, I can usually manage my emotions”), “moral competence” (4 items, e.g., “I have high moral standards about my behaviors” and “I have a habit of self-reflection”), “spirituality” (4 items, e.g., “I have found my purpose in life” and “I believe spiritual riches are more important than material prosperity”), and “resilience” (3 items, e.g., “when I face difficulties, I do not give up easily” and “my belief is that even though tomorrow becomes worse, I will still live in a good manner”). A total PYD score was also computed according to each participant’s responses to the ten subscales. Details of reliabilities of the higher-order PYD factors in pretest and posttest are presented in Table 2. This scale has been used in many studies and there are findings showing that the scale and the related subscales are valid and reliable.

Assessment of SL Qualities and Beliefs

As aforementioned, three subscales with 28 items in total were adopted to measure essential qualities and attributes related to SL including “self-leadership,” “character strength,” and “caring disposition.” The “self-leadership” subscale included 5 items with sample items as “I have a good planning on my life” and “I control my own behavior to avoid stepping out of line.” The subscale of “character strength” had 15 items and samples items were “I do not hesitate to fight against what I think wrong despite opposition” and “most of the time, I can keep my mind peaceful in face of gains or losses.” The third subscale, “caring disposition,” consisted of 8 items with two sample items as “I know how to appreciate others, even those who are completely different from me” and “I pay attention to others when they are talking to me.” Beliefs about SL were assessed by 6 items pertinent to one’s identification with SL notions. Sample items included “leadership effectiveness is determined by situational task competencies, character strength and caring ability” and “a successful leader should try his/her best to improve his/her competencies and satisfy others’ needs.” All the 34 items were rated on a 6-point scale (“1” = “strongly disagree,” “6” = “strongly agree”). In our study, the four subscales also showed good internal consistency as suggested by the Cronbach’s alpha coefficients ranging from .72 to .91 in the pretest and posttest (see Table 2).

Data Analysis

First, the internal consistency of the measurement tools used in the pretest and posttest was examined through a series of reliability test. Second, to compare participating students’ posttest scores with corresponding pretest scores on the outcome indicators, we performed three repeated-measures multivariate GLM (i.e., “general linear model”) analyses with three types of outcome measure (i.e., LS, PYD, and SL qualities and beliefs) as the DVs (“dependent variables”) and the time (i.e., pretest vs. posttest) as the IVs (“independent variables”). The Bonferroni adjustment procedure was used to reduce Type I error in detecting omnibus time effect. Following multivariate analyses, univariate analyses were performed for each indicator of PYD or SL qualities and beliefs. SPSS 25.0 was used to conduct reliability tests and GLM analyses.

Finally, AMOS 25.0 was used to do two cross-lagged path analyses to investigate associations between changes in well-being indicators and SL qualities. Figure 1 shows the cross-lagged models. Each model involved two scores (pretest and posttest) of two variables: a well-being indicator (LS or PYD total score) and SL qualities indicated by a composite score of self-leadership, character strength, caring disposition and beliefs of SL. In each model, there were six paths representing associations among different variables. Taking the cross-lagged model including SL qualities and PYD total score as an example, the six paths were:

- “Concurrent relationship” (CR): the correlational relationship between two pretest scores;
- “Temporal effect 1” (TE1): SL qualities pretest score predicted its posttest score;

- “Temporal effect 2” (TE2): PYD pretest score predicted its posttest score;
- “Cross-lagged effect 1” (CLE1): the effect of pretest score of SL qualities on PYD total score at posttest;
- “Cross-lagged effect 2” (CLE2): the effect of PYD total score at pretest on the posttest score of SL qualities;
- “Correlated change” (CC): the correlation between the residuals of SL qualities and PYD total score at posttest.

Figure 1. Cross-lagged models among service leadership qualities and well-being indicators in pretest and posttest. PYD: Positive youth development; CR: Concurrent relationship; TS1: Temporal stability of service leadership qualities; TS2: Temporal stability of well-being; CLE1: Cross-lagged effect of service leadership qualities on well-being; CLE2: Cross-lagged effect of well-being on service leadership qualities; CC: Correlated change.

As shown in Figure 1, there was an association between any two variables in one model. Thus, both cross-lagged models were saturated (i.e., $df = 0$ or Fitness statistics were perfect). Furthermore, after CR, TE1, TE2, CLE1, and CLE2 were statistically controlled, CC represented a valid estimated correlation between within-individual changes from pretest to posttest regarding well-being indicator and SL qualities measure [25, 35]. This analysis method has been widely used in personality studies to explore the common mechanism underlying the development of two different personality traits [e.g., 36]. In the present study, analyses of CC helped to inform whether well-being and SL qualities increased together. We expected that there would be significantly correlated changes between SL attributes and well-being.

FINDINGS

As shown in Table 2, there was a significant omnibus time effect for PYD attributes ($F(3, 85) = 3.43, p < .05, \eta^2_p = .108$). Thus, it can be concluded that students gained significant development in their PYD attributes. Follow-up univariate analyses showed that there was also a significant improvement in each higher-order PYD factor (“cognitive-behavioral competencies”: $F(1, 87) = 7.39, p < .01, \eta^2_p = .078$; “positive identity”: $F(1, 87) = 8.57, p < .01, \eta^2_p = .090$; “general PYD qualities”: $F(1, 87) = 4.17, p < .05, \eta^2_p = .046$; “total PYD

score”: $F(1, 87) = 9.17, p < .01, \eta^2_p = .095$). For LS, a marginally significant improvement was observed ($F(1, 87) = 3.70, p = .058, \eta^2_p = .041$). These findings suggested an increasing trend in students’ both psychological and subjective well-being after completing the “Service Leadership” subject which are consistent with the original prediction of the study.

Table 3. Standardized path coefficients of cross-lagged analyses ($N = 88$)

Variables in the cross-lagged analyses	Standardized path coefficients (β)					
	CC	CR	TS1	TS2	CLE1	CLE2
Service leadership qualities and life satisfaction	.40**	.30***	.61***	.59***	.08	.05
Service leadership qualities and total positive youth development score	.75***	.76***	.54***	.58***	.08	.11

Note. CC = Correlated change; CR = Concurrent relationship; TS1 = Temporal stability of service leadership qualities; TS2 = Temporal stability of well-being; CLE1 = Cross-lagged effect of service leadership qualities on well-being; CLE2 = Cross-lagged effect of well-being on service leadership qualities. * $p < .05$; ** $p < .01$; *** $p < .001$.

Similar to the results of PYD factors, the omnibus time effect for SL qualities was also significant ($F(3, 85) = 3.24, p < .05, \eta^2_p = .134$). A series of univariate analyses were also performed for each indicator and significant positive changes were identified for all indicators (“self-leadership”: $F(1, 87) = 4.75, p < .05, \eta^2_p = .052$; “character strength”: $F(1, 87) = 4.73, p < .05, \eta^2_p = .052$; “caring disposition”: $F(1, 87) = 5.67, p < .05, \eta^2_p = .061$; ‘beliefs of SL’: $F(1, 87) = 10.73, p < .01, \eta^2_p = .110$). Overall speaking, SL qualities and beliefs among students improved significantly after they completed the subject. Again, these findings are consistent with the original expectations.

Correlated Changes in Student Well-Being and SL Qualities

As aforementioned, we used cross-lagged models to detect the relationship between changes in well-being and SL qualities. The results are depicted in Table 3. After statistically controlled temporal stability of both well-being and SL attributes as well as cross-lagged effects between each other, significant correlated changes were identified in both models (SL qualities and LS, $\beta = .40, p < .01$; SL qualities and total PYD, $\beta = .75, p < .001$). In general, the improvement of university students’ well-being in terms of LS and PYD attributes was significantly associated with their positive changes in SL qualities.

DISCUSSION

The SL education initiative was launched in Hong Kong to sustain its competitive advantage in the service era through nurturing SL qualities and promoting well-being among university students. By using the one-group pretest-posttest quantitative evaluation method and collecting self-reported data from participating students, this study evaluated the effectiveness of the SL education based on the “Service Leadership” subject offered in one university in Hong Kong.

The present findings are encouraging as students generally achieved positive changes in both SL qualities and well-being after completing the subject. Specifically, in comparison to the baseline conditions in the pretest, students demonstrated better “cognitive-behavioral competencies,” “positive identity,” “general PYD qualities,” and “total PYD qualities” in the posttest, which reflected improved psychological well-being. In addition, there was also an increasing trend in student life satisfaction, despite that the improvement was marginally significant. Furthermore, students also gained significant improvement in their SL attributes in terms of “self-leadership,” “character strength,” “caring disposition,” and “SL beliefs.” These findings support our expectations. They are also in line with previous studies and provide support for the effectiveness of the subject in enhancing students’ SL qualities and well-being levels [16].

Regarding the question of why the “Service Leadership” subject influenced participants positively, not only in SL qualities but also in well-being, there are several points to be noted. First, the subject was created and designed based on the “Service Leadership Theory” which endorses the holistic development of university students in terms of a wide spectrum of competencies (e.g., emotional competence, spirituality, and relationship building, etc.) as well as moral character and caring for others. In addition, some propositions of this theoretical basis echo PYD theory that focuses on youths’ potentials and what they are capable of instead of the problems they have [20]. For example, the core belief of “everyone is (can be) a leader” reflects the PYD notion that “young people are resources to be developed.” In this regard, the subject teaching materials accordingly incorporated the perspective of positive and whole-person development. While being taught with knowledge or theories, students’ abilities and potentials were fully admitted so that they were encouraged to recognize their own strengths and make more growth. In the literature of PYD, the cardinal belief is that young people have strengths and potentials. The core issue is how to nurture their competences and unleash their potentials. In short, the present findings are consistent with the predictions of the positive youth development literature.

Second, the subject adopted various teaching modes based on teaching and learning purposes. These methods included lecture, group project and in-class activities (e.g., role play and drawing, etc.) which enhanced teacher-student, as well as student-student interactions. The mixed-mode teaching style also helped to create a better teaching and learning atmosphere which is conducive to students’ proactive involvement in learning. This conjecture is consistent with Larson’s [37] argument that youth activities can be useful in enhancing young people’s concentration and initiative in fostering their positive development. Evidence from previous studies also suggested that the mixed-mode teaching style can improve teaching effectiveness and students’ learning achievement [22]. In addition, in the “Service Leadership” subject, students also had plenty of opportunities to do individual or collaborative reflection excises for obtaining a better self-understanding, which is of great significance in personal and professional development [38, 39]. In the era of the Internet, the learning mode of young people has changed from passively listening to lectures to actively learning via collaboration with peers and teachers. Hence, the study underscores the importance of utilizing more active mode of teaching and learning for students. In future, studies should be conducted to evaluate how different modes of teaching and learning might influence the achievement of learning outcomes of the subject.

The present positive findings provide additional support for Lin and Shek’s [25] argument that SL qualities can be developed and well-being can be nurtured through proper

curriculum-based leadership education or training. This is different from conventional views of leadership that only those elite persons who occupy relatively higher positions can take a leading role [40]. Instead, curriculum-based leadership development approach is able to reach and benefit a general population of university students rather than only serving a small group of students (e.g., a certain kind of elite students). Although the “Service Leadership” subject under investigation in the present study was initially launched in Hong Kong where the service economies are overwhelming predominant, the application of formal curriculum-based leadership education is certainly not limited to Hong Kong or service-dominant economies. For example, SL education and training have also been implemented in mainland China and Cambodia, where the service economies are less developed compared with Hong Kong. In fact, empirical studies also showed that the SL programs in these two places also achieved a big success and effectively promoted participating students’ leadership development and well-being [20, 22].

Empirically, students’ positive changes in SL attributes were significantly related to their improvement in life satisfaction and PYD, index of subjective and psychological well-being, respectively. The results are in line with Lin and Shek’s [25] previous observation which showed that the increase in student life satisfaction was closely linked with their positive attitudinal changes regarding SL. Once again, the present findings inform the possibility that one’s endorsement of the new concept of SL notions, mindset change toward taking service-orientation as well as the development of SL qualities (e.g., moral character and concern for other’s welfare) is very much likely to enhance the one’s sense of accomplishment and good feelings about the overall quality of life. Theoretically speaking, the proposal of SL concepts stresses on a people-orientation in the service era, emphasizing on both others’ satisfaction and one’s own development and fulfillment [41]. Thus, the present study provides empirical support for this thesis. Furthermore, the findings are consistent with the previous observation of a close linkage between leadership qualities and well-being [24, 31]. Nevertheless, the present study only spoke a correlational relationship between changes, and future research is needed to directly detect the possible causal effect of leadership development on well-being.

Despite the important and positive findings, this study has some limitations. The first limitation is the lack of a control group to minimize threats over internal validity so that the cause-effect relationship between leadership education and student positive development can be concluded. However, it should be noted that the use of control group may not be easy in the educational context and there would be many confounding variables involved. Second, without follow-up tests, the influence of the subject in a long run is unknown. Previous research revealed that students showed even greater positive changes two weeks after the completion of an intensive “Service Leadership” subject [22]. It is necessary to conduct follow-up tests to examine the long-term sustainability of student positive changes after the end of the subject. In addition, there is a need to measure students’ actual leadership behavior and practice in addition to their self-perceptions in follow-up tests. In this way, the effectiveness of the SL education in promoting student SL behavior in daily life can be rigorously determined. Third, the research method used in this study was quantitative methodology and the data were collected solely from participants’ self-report questionnaire. In future studies, other methods such as objective observations, peer-report or teacher-report can be adopted to further strengthen the evaluation findings. Finally, the sample size of the study was not large (although the findings are quite robust). In future, it would be exciting to conduct a meta-analysis of the changes in the students based on the several studies conducted

previously. Despite these limitations and in conjunction of other studies utilizing the one-group pretest-posttest design [42-44], the present study underscores the usefulness of using this methodology in understanding the changes in the young people taking service leadership subjects or other kinds of training programs.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. ABSTRACT

The fifth cohort of SOAR Youth Leadership Program 2017/2018 was launched in Beijing in the summer of 2018. A 21-hour intensive “Service Leadership” course was conducted with 43 undergraduate students who studied at The Hong Kong Polytechnic University (PolyU) and the Peking University (PKU). This study employed a mix-method approach that integrated both qualitative and quantitative data to evaluate the effectiveness of the “Service Leadership” course, including students’ views on the program content, lecturers, and overall satisfaction. Consistent with previous studies, the three dimensions were significantly correlated. Students’ responses collected through quantitative and qualitative methods were generally positive, suggesting that the program could promote service leadership qualities in the program participants.

INTRODUCTION

Apart from providing professional knowledge, university also shoulders the responsibility to nurture future leaders for the society. In the book “Excellence without a soul,” Harry Lewis stated that although university has the responsibility to nurture students to obtain autonomy, resilience, and responsibility from higher education, not all universities achieve this fundamental purpose [1]. Moreover, over-emphasis on funding and research grants has become prevalence and universities have lost their mission to nurture students’ holistic development. Tull argued that Lewis’s observations can be applied to many other institutions of high education [2]. Instead of facilitating the development of students’ inner life and character, universities over-emphasize students’ achievements [3]. Unfortunately, this development cannot respond to emerging adolescent developmental issues such as substance abuse, mental problems, delinquency, narcissistic personalities, and egocentrism [4]. Also, employers are not satisfied with graduates’ interpersonal cooperation and maturity when they worked in their first jobs [4]. In view of this situation, how to promote adolescents’ holistic development becomes crucial and critical.

Shek and Ma [5] argued that it is helpful to nurture adolescents through the development of credit-bearing courses on positive youth development. The Service Leadership subject is grounded in the positive youth development approach, which emphasizes adolescents’ potentials and capability, instead of their problems. Positive youth development assets are closely correlated with adolescent developmental outcomes. Specifically, the more developmental assets adolescents have, the less risky behaviors they would display; hence resulting in more positive development outcomes [6]. There are two types of developmental assets: external (e.g., support, empowerment, boundaries, expectations, etc.) and internal assets (e.g., commitment to learning, positive values, and social competencies) [7]. Catalano and his colleagues [8] identified 14 developmental assets [5], including promotion of bonding, cultivation of resilience, promotion of social competence, promotion of emotional competence, promotion of cognitive competence, promotion of moral competence, cultivation of self-determination, and fostering prosocial norms. Shek and Ma [9] asserted that these positive youth developmental constructs would help to shape leadership qualities in university students. Since the Service Leadership subject is implemented, there are many students of different professional disciplines taking the subject. The subject has been kept updating and developing throughout the years. A range of evaluation studies have shown the effectiveness of the Service Leadership subject.

Quantitative and qualitative research methods, both of which has its own merits and shortcomings, are the two main strategies used in natural and social science. Quantitative research is used to examine the relationships among variables, which intends to predict, interpret, and control phenomenon [10]. The method has been widely adopted in social science. There are several characteristics of quantitative research methods. First, quantitative data, standardized measures, and uniform procedures in quantitative research can provide accurate and objective evidence to predict and explain the phenomenon [11]. The standardization and objectivity of quantitative research make it a practicable method to validate, compare, or repeat research study. Furthermore, probability sampling makes the findings generalizable [12]. Researchers’ biases can be minimized through standard procedure [13]. Compared to qualitative research, quantitative research is more economical in terms of

study duration or human and fiscal capacity [14]. Although there are many merits of the quantitative approach, whether it can be used in investigating social and human world remains controversial, especially on the sides that the reality could not be fully explained by numerals and it could be difficult for the observers to have total objectivity [13].

Qualitative research is employed to gather non-numerical data [15], which focuses on the essence of social phenomena [16]. As Peshkin [17] stated, the main objectives of qualitative research are description, interpretation, verification, and evaluation. To achieve these objectives, the most common methods used in qualitative research are interviews, documents, and observations [18]. Although the methods used in different studies might be varied, they shared the same strengths. First, the methods applied in qualitative research are diverse and flexible, which include action research, case study, ethnography, and other related methods. Second, qualitative research allows us to collect data without simplifying the complexity of reality. The research questions can function as a guide on choosing the most appropriate methods [19], which can facilitate researchers to be close to reality [11]. However, qualitative research highly depends on researchers' interpretation, which leads to the question of whether researchers' bias may affect the validity and reliability of findings. Sample representativeness and findings' generalization are also in doubt.

Integrating quantitative and qualitative research methods can provide a holistic perspective on understanding the reality of the social and human world. This approach may have various names, such as multi-methods [20], mixed methodology [21], mixed-methods [22], and multi-strategy research [23]. Researchers adopting the mix-method approach could reap the advantages of each method and minimize the shortcomings [24]. As a result, a more complete and comprehensive understanding of the subject matter can then be obtained [25, 26]. In other words, this type of approach can fulfill the needs to understand the information encoded in the variables, which makes the interpretation more meaningful and accurate [27, 28]. Greene, Caracelli, and Graham [29] illustrated five reasons to utilize mix-method approach, which are triangulation, complementarity, development, initiation, and expansion. Irrespective of the justifications in choosing mix-method research, participants and researchers' involvement in this approach is enhanced [30].

The objective of this paper is to evaluate the perceptions of undergraduate students on the "Service Leadership" course of the "SOAR Youth Leadership Program" (SOAR) using a mix-method approach. This one-year credit-bearing program was jointly hosted by The Hong Kong Polytechnic University and the Peking University. SOAR is the abbreviation of "Serving Heart," "Open-mindedness," "Aspiration," and "Responsibility." The goals and objectives of this program are to nurture all-rounded youth leaders of tomorrow and create an international exchange platform for youth leaders. In July 2018, SOAR Youth Leadership Program 2017/2018 was launched in Beijing. A total of 43 undergraduate students were recruited in the study, including 21 students from The Hong Kong Polytechnic University and 22 from Peking University.

The "Service Leadership" course was the conceptual framework of the program, which was defined by the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM) as "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, communities, systems and environments" (Chung, 2011). Different from other paradigms of leadership, this theory emphasizes that it is equally significant to satisfy the needs of self, others, and systems (i.e., three realms of Service Leadership). Instead of manipulating others with the authority to

satisfy one's own needs, an effective service leader should respect others, care subordinates' needs and welfare, and transcend self-interest to satisfy the needs of others and systems. An excellent service leader will influence others with good character, such as empathy and caring [31]. According to the theory, the service object includes self, others, and systems, which means if one leads himself or herself well, then he or she can serve others well. Specifically, a capable service leader ethically improves his or her competence and manage himself or herself, which enables him or her to lead others and optimize the effect of the service to the communities, societies, and environment [32].

As Chung and Elfassy stated, $E = MC^2$, where "E" represents effective service leadership, "M" means leaders' moral character, and "C" stands for competencies and caring disposition [33]. Moral character refers to the moral values and integrity an effective leader should have, such as authenticity, honesty, and credibility. In other words, the leader should know what to do and what not to do. Competencies included leadership competence, interpersonal competence, intrapersonal competence, and business competence [34]. To guide leadership practice, an effective leader should possess the competencies listed above. Caring disposition is related to love, listening, and empathy. Rather than manipulating followers to fulfill his or her own needs, a leader with caring will respect his or her followers and concern with their benefits.

The HKI-SLAM proposed 7 core beliefs of Service Leadership. First, leadership is a kind of service, serving self, others, and systems in an ethical way. According to Chung's definition [35], service is the activities featured by human interaction. To serve is leadership's basic precondition. Second, everyone has the chance to assume a leadership position in daily life and has the potential to improve leadership's quality and effectiveness. Leadership is not inherent nor owned by the high-powered people. Everyone can practice his or her leadership skills through daily service transactions. Third, the effectiveness of leadership counts on both leader's specific competencies related to the task and his or her moral character and caring disposition valued by subordinators and receivers. The moral behavior [36] and caring disposition [37] of service providers have a profound effect on customers' loyalty and commitment. Fourth, to satisfy others' needs, a leader should ethically improve his or her competences, abilities, and willingness. Chung insisted that without a healthy mind, body, and spirit, leaders are unable to optimize their ability to serve others [35]. Fifth, personal service in high quality should be constantly provided to the people that the leaders encountered, including leaders themselves. Consistency and personalization of the service were highlighted in this belief. Sixth, as a business model, service leadership is not only the most competitive but also the longest surviving model of leadership. In other words, this is an adaptive group model, which focuses on collaborative service-focused thinking and behavior. Seventh, people who want to obtain leadership positions with high pay, high status and management promotions in current society should possess service leadership competencies, moral character, and caring disposition.

The primary goal of this course is to nurture students' holistic development. The knowledge of the service leadership model, seven core beliefs, and three components were included in the lectures through role play, group discussion, self-reflection, drawing, and other activities. The integration of academic content and students' real-life experiences are expected in the course. Several intended learning outcomes are: 1) understand the basic models of leadership and core beliefs about service leadership; 2) comprehend the three major elements (MC^2) of effective service leadership (E); 3) reflect on one's leadership qualities and

develop the basic qualities an effective service leader needs; and 4) appreciate the potential application of knowledge learned from this subject to oneself.

The positive outcomes of the Service Leadership subject and students' satisfaction have been evaluated by a variety of evaluation mechanisms, such as objective outcome evaluation, subjective outcome evaluation, process evaluation, focus group interview, and case study [38]. Generally speaking, the effectiveness of this course was supported and well received by the students. Specifically, the positive changes of students can be observed from the results of quantitative evaluations [39], especially in the outcome measures of moral competences and life satisfaction. On the other hand, the findings observed from the qualitative evaluation showed that students who attended this course valued it as useful, interesting, and meaningful. Besides, students stated they obtained practical knowledge of service leadership, and their leadership qualities were promoted after joining the course [40, 41]. These findings showed that the Service Leadership subject was well designed [42].

Date	Session	Lecture Topic
July 4, 2018 (Wednesday)	Afternoon (2pm-5pm)	Lecture 1 • Introduction to Service Leadership and SOAR Program • Realms, Models of Service Leadership, and differences between the manufacturing economy and service economy
July 5, 2018 (Thursday)	Morning (9am-12pm)	Lecture 2 • Seven Core Beliefs of Service Leadership • E (Effective Service Leadership) = MC^2 (Moral character $\times$ Competence $\times$ Care)
	Afternoon (2pm-5pm)	Lecture 3 • Intrapersonal Competencies and Service Leadership • IQ (task-relevant knowledge, problem solving, and decision making); EQ (understanding and managing emotion effectively); AQ (adversity quotient); SQ (spiritual quotient)
July 7, 2018 (Saturday)	Morning (9am-12pm)	Lecture 4 • Interpersonal competencies and Service Leadership (Communication skills; positive social relationship building; conflict resolution) • Promoting Positive Social relationship
	Afternoon (2pm-5pm)	Lecture 5 • Character Strengths and Service Leadership (love of learning, honesty, courage, perseverance, humility, and gratitude) • Character Strengths in Chinese Philosophies (integrity (lian), shame (chi), loyalty (zhong), filial piety (xiao), benevolence (ren), affection (ai), trustworthiness (xin), righteousness (yi), propriety (li), wisdom (zhi), harmony (he) and peace (ping))
July 8, 2018 (Sunday)	Morning (9am-12pm)	Lecture 6 • Caring Disposition and Service Leadership (Universal dimensions of social cognition (warmth and competence); primary elements of care (love, listening, and empathy) • Becoming Caring Service Leaders
	Afternoon (2pm-5pm)	Lecture 7 • Developmental Asset (Self-esteem, self-efficacy, purpose in life and optimism about future) • Self-Leadership and Service Leadership • Recap of Service Leadership and Core Beliefs • Sharing and reflections

Figure 1. Course arrangement and content outline of the 21-hour course in 3.5 days.

The course conducted in SOAR Youth Leadership Program 2017/2018 was a 21-hour intensive Service Leadership program. Whether the intensive course is as beneficial as the full-term service leadership course to the students, and whether this intensive course is well received are explored in this paper.

OUR STUDY

In the summer of 2017/2018 academic year, “SOAR Youth Leadership Program” conducted the intensive “Service Leadership” course in Beijing. The participants were students from The Hong Kong Polytechnic University (n=21) and Peking University (n=22). Upon completion of the course, the students were invited to complete two forms, namely course evaluation form and personal reflection form. Student consent was obtained to ensure voluntary participation which they were informed of their right to withdraw from the study without any consequences. A total of 41 sets of questionnaires were collected, with a response rate of 95.35%.

Instruments

The evaluation of this study consisted of quantitative and qualitative data which were collected through the Course Evaluation Form and Personal Reflection Form.

Course Evaluation Form (Quantitative and Qualitative Data)

The Course Evaluation Form was used to evaluate the effectiveness of leadership series courses with sound psychometric properties [43]. It composed of five parts as follows:

- 1) Students’ views on course content, which included 10 items covering course objectives, activities, classroom atmosphere, learning experience, etc.
- 2) Students’ views on lecturers, which included 10 items on teaching-skills, attitudes toward profession, class interaction, mastery of the course.
- 3) Students’ views on the extent to which the course has helped them, such as enhancement of social competence and resilience (18 items).
- 4) Overall satisfaction with the course (3 items), including whether suggesting this course to their friends, intend to participate in similar courses, and satisfaction with this course.

A 5-point Likert Scale was utilized in the first four parts, with ratings of “4” and “5” indicating positive responses.

- 5) Four open-ended questions: (a) important things they learned from this subject; (b) one thing they appreciate most in this subject; (c) comments about the lecturers; and (d) aspects should be improved.

Personal Reflection Form (Qualitative Data)

In the qualitative study, we used the Personal Reflection Form to capture the course’s effectiveness focusing on two parts:

- 1) Three words or phrases to express students' perception and comment on this course.
- 2) One metaphor with a brief interpretation that can represent the course.

Data Analyses

Quantitative and qualitative data are collected through the course evaluation form. For the quantitative data analyses, reliability analyses were first conducted to test internal consistency. Second, descriptive statistics were conducted to evaluate the participants' perceptions to better understand the responses of students. Thirdly, correlation analysis was conducted to explore the relationships amongst the subscales. Coding and counting positive response rates were used to analyze the qualitative data collected from the four open-ended questions.

Based on the previous studies [40, 44], responses collected from the Personal Reflection Form were transcribed and coded. If one descriptor had two or more meanings, they would be separated and categorized as two or more meaning units. For example, a student wrote "*touching and helpful*" as one descriptor, which could be divided into "touching" and "helpful" as two meaning units. On the other hand, if two or more descriptors shared one meaning, these descriptors would be merged as one category. The meaning units were subsequently categorized as "Positive," "Neutral," "Negative," or "Undecided."

The coding method was utilized in the metaphors as well. Metaphors were first classified as "Positive," "Neutral," "Negative," or "Undecided." If the explanation had more than one meaning units, the metaphor would be derived into several meaningful units accordingly. Then, the derived items would be coded into different categories. To test the consistency of coding, 20 descriptors and 20 metaphors were selected randomly to test the intra-rater and inter-rater reliabilities. Two coders coded the selected items separately to examine the intra-rater reliability; then, another two coders were invited to code the same set of items to test the inter-rater reliabilities.

Table 1. Mean, standard deviations, Cronbach's alphas, and mean of inter-item correlations amongst the variables

	Mean	Standard Deviation	Cronbach's alpha	Mean [#]
Program content (10 items)	4.50	.36	.77	.25
Program implementers (10 items)	4.73	.37	.90	.54
Program effectiveness (18 items)	4.25	.60	.96	.55
Total effectiveness (38 items)	4.44	.43	.96	.39
Overall satisfaction (3 items)	4.20	.69	.82	.66

Note: Mean[#]: inter-item correlation.

OUR FINDINGS

As shown in Table 1, the reliability analyses of Course Evaluation Form had an acceptable internal consistency: program content (Cronbach's alpha=0.77), program implementers (Cronbach's alpha=0.90), program effectiveness (Cronbach's alpha=0.96), total effectiveness (Cronbach's alpha=0.96), and overall satisfaction (Cronbach's alpha=0.82).

The descriptive analyses showed that the participants rated positively about this course in Table 2. In the ten items that assessed the course content, positive response ranged from 80.5% (n=33) to 100% (n=41). Specifically, all 41 participants agreed that curriculum objectives were clear and atmosphere of the class was pleasant, and they enjoyed the interaction between peers. In the open-ended question of “the most appreciate things in the course,” 28 out of 38 (73.68%) responded with positive comments (see Table 7). Those are related to the well-arranged activities, peer interaction, and pleasant atmosphere. For the metaphors about the program content, there were 19 meaningful units (see Table 9).

Referring to the perception of the lecturers (see Table 3), all participants (n=41) responded with a positive evaluation of the lecturers. There were 6 items with 100% positive responses, which included “*lecturer well prepare the lessons*,” “*showed good professional attitudes*,” “*lecturers involved in the class*,” “*encouraged students to join the activities*,” “*cared students*,” and “*ready to provide help to students*.” Although the positive response ratio of “teaching skills” was lower than other items, there were still 90.2% (n=37) students responded positively on the teaching skills of lecturers. “Professional,” “Caring,” and “Patience” were the most frequently appeared phrases in the open-ended question (see Table 7) as well as the interpretations of metaphors related to lecturers (see Table 9).

Table 4 presents the findings on the program effectiveness perceived by the students. All participants (n=41) admitted that the course has helped them to comprehend the importance of situational task competencies, character strength, and caring disposition in successful leadership. There were 97.6% (n=40) of the participants agreed that the course enabled them to cultivate compassion and caring for others; 39 out of 41(95.1%) participants gained knowledge (e.g., theories, research, concepts, etc.) covered in the course, which allowed them to understand the characteristics that successful service leaders need. Besides, students’ responses to the first question showed additional effects (see Table 7), such as accommodating others’ opinions and enhance communication skills. These effects also appeared in the descriptors and metaphors (see Tables 8 and 9).

Regarding overall satisfaction, 40 participants (97.6%) agreed that they were satisfied with the Service Leadership course. There were 85.4% of participants willing to recommend this subject to their friends, while only 25 out of 41 (61%) participants would consider to register a similar course in the future. The students also offered suggestions for course improvement in the fourth open-ended question (see Table 7), some of which also can be seen in the metaphors’ explanations. Furthermore, Pearson correlation analyses showed that all the subscales were significantly correlated (see Table 6).

Table 8 presents the results of descriptors coding. A total of 120 out of 134 (89.55%) descriptors were coded as positive. The top three most mentioned descriptors were “Inspiring/Inspired/Enlightening,” “Helpful/Useful/Benefit” and “Interesting/Fun/Attractive,” with 19, 15, 11 times mentioned respectively. The numbers of descriptors regarded as neutral, negative and undecided were 11 (8.21%), 2 (1.49%), and 1 (0.75%).

To test the consistency of coding, 20 items of the descriptors were randomly selected to examine the reliabilities. To assess intra-rater reliabilities, the raters who participated in the coding process are invited to rate the 20 items one more time. To assess inter-rater reliabilities, another two research assistants who were not involved in the original coding process were invited to rate the 20 items. The intra-rater agreements were 90% and 95%, and the inter-rater congruence were both 95%.

Table 2. Descriptive statistics of the participants' evaluations on the program content

Participants' views towards the program contents:	1		2		3		4		5		Content	
	Strongly Disagree		Disagree		Neutral		Agree		Strongly Agree		Positive responses (Options 4-5)	
	n	%	n	%	n	%	n	%	n	%	n	%
1. The objectives of the curriculum are very clear.	0	0	0	0	0	0	16	39.0	25	61.0	41	100.0
2. The content design of the curriculum is very good.	0	0	0	0	8	19.5	20	48.8	13	31.7	33	80.5
3. The activities were carefully arranged.	0	0	1	2.4	1	2.4	13	31.7	26	63.4	39	95.1
4. The classroom atmosphere was very pleasant.	0	0	0	0	0	0	8	19.5	33	80.5	41	100.0
5. There was much peer interaction amongst the students.	0	0	0	0	0	0	10	24.4	31	75.6	41	100.0
6. I participated in the class activities actively (including discussions, sharing, games, etc.).	0	0	0	0	4	9.8	18	43.9	19	46.3	37	90.2
7. I was encouraged to do my best.	0	0	1	2.4	1	2.4	16	39.0	23	56.1	39	95.1
8. The learning experience enhanced my interests towards the course.	0	0	1	2.4	2	4.9	15	36.6	23	56.1	38	92.7
9. Overall speaking, I have a very positive evaluation on the course.	0	0	2	4.9	1	2.4	12	29.3	26	63.4	38	92.7
10. On the whole, I like this course very much.	0	0	0	0	5	12.2	18	43.9	18	43.9	36	87.8

Table 3. Descriptive statistics of the participants' evaluations of the program implementers

Participants' views towards the program implementers:	1		2		3		4		5		Content	
	Strongly Disagree		Disagree		Neutral		Agree		Strongly Agree		Positive responses (Options 4-5)	
	n	%	n	%	n	%	n	%	n	%	n	%
1. The lecturer(s) had a good mastery of the course.	0	0	1	2.4	1	2.4	12	29.3	27	65.9	39	95.1
2. The lecturer(s) was (were) well prepared for the lessons.	0	0	0	0	0	0	7	17.1	34	82.9	41	100.0
3. The teaching skills of the lecturer(s) were good.	1	2.1	0	0	3	6.3	11	26.8	26	63.4	37	90.2
4. The lecturer(s) showed good professional attitudes.	0	0	0	0	0	0	9	22.0	32	78.0	41	100.0
5. The lecturer(s) was (were) very involved.	0	0	0	0	0	0	10	24.4	31	75.6	41	100.0
6. The lecturer(s) encouraged students to participate in the activities.	0	0	0	0	0	0	8	19.5	33	80.5	41	100.0
7. The lecturer(s) cared for the students.	0	0	0	0	0	0	5	12.2	36	87.8	41	100.0
8. The lecturer(s) was (were) ready to offer help to students when needed.	0	0	0	0	0	0	7	14.6	34	70.8	41	100.0
9. The lecturer(s) had much interaction with the students.	0	0	0	0	1	2.4	10	24.4	30	73.2	10	97.6
10. Overall speaking, I have a very positive evaluation on the lecturer(s).	0	0	0	0	0	0	13	31.7	28	68.3	41	100.0

Table 4. Descriptive statistics of the participants' evaluations of the program effectiveness

	Participants' views towards the program effectiveness	1		2		3		4		5		content	
		Strongly Disagree		Disagree		Neutral		Agree		Strongly Agree		Positive responses (Options 4-5)	
		n	%	n	%	n	%	n	%	n	%	n	%
1.	It has enhanced my social competence.	1	2.4	1	2.4	2	4.9	22	53.7	15	36.6	37	90.2
2.	It has improved my ability in expressing and handling my emotions.	0	0	2	4.9	6	14.6	18	43.9	15	36.6	33	80.5
3.	It has enhanced my critical thinking.	0	0	4	9.8	4	9.8	17	41.5	16	39.0	33	80.5
4.	It has increased my competence in making sensible and wise choices.	0	0	1	2.4	7	17.1	18	43.9	15	36.6	33	80.5
5.	It has helped me make ethical decisions.	0	0	2	4.9	4	9.8	18	43.9	17	41.5	35	84.3
6.	It has strengthened my resilience in adverse conditions.	0	0	0	0	7	17.1	24	58.5	10	24.4	34	82.9
7.	It has strengthened my self-confidence.	1	2.4	2	4.9	6	14.6	18	43.9	14	34.1	32	78.0
8.	It has helped me face the future with a positive attitude.	0	0	0	0	6	14.6	15	36.6	20	48.8	35	85.3
9.	It has enhanced my love for life.	0	0	2	4.9	6	14.6	16	39.0	17	41.5	33	80.5
10.	It has helped me explore the meaning of life.	1	2.4	1	2.4	9	22.0	14	34.1	16	39.0	30	73.2
11.	It has enhanced my ability of self-leadership.	0	0	0	0	3	7.3	16	39.0	22	53.7	38	92.7
12.	It has helped me cultivate compassion and care for others.	0	0	0	0	1	2.4	15	36.6	25	61.0	40	97.6
13.	It has helped me enhance my character strengths comprehensively.	0	0	2	4.9	4	9.8	18	43.9	17	41.5	35	85.4
14.	It has enabled me to understand the importance of situational task competencies, character strength and caring disposition in successful leadership.	0	0	0	0	0	0	20	48.8	21	51.2	41	100.0
15.	It has promoted my sense of responsibility in serving the society.	0	0	1	2.4	3	7.3	19	46.3	18	43.9	37	90.2
16.	It has promoted my overall development.	1	2.4	0	0	5	12.2	17	41.5	18	43.9	35	85.4
17.	The theories, research and concepts covered in the course have enabled me to understand the characteristics of successful service leaders.	0	0	1	2.4	1	2.4	18	43.9	21	51.2	39	95.1
18.	The theories, research and concepts covered in the course have helped me synthesize the characteristics of successful service leaders.	0	0	2	4.9	4	9.8	17	41.5	18	43.9	35	85.4

Table 5. Summary of the participants' perceptions toward other aspects

3.	On the whole, are you satisfied with this course?	0	0	0	0	1	2.4	22	53.7	18	43.9	40	97.6

Table 6. Pearson correlations among program content, instructors, and effectiveness

Variables	1	2	3	4	5
1) Program content (10 items)	-				
2) Program instructors (10 items)	.61**	-			
3) Program effectiveness (18 items)	.70**	.73**	-		
4) Total effectiveness	.81**	.84**	.97**	-	
5) Overall Satisfaction	.68**	.67**	.89**	.88**	-

Table 7. Summary of students' written comments on the course (N=41)

	Positive responses	Total responses	Percentage (%)	Highlights
1) The most important thing(s) learned in the course	36	41	87.8	"I learned that sympathy and empathy are two different concepts and we should show empathy, not sympathy, to people in need." "The ways to be a self-leader" "I have learned the nature of intellectual quotient, AQ, EQ and emotional control"
2) The things that appreciated most in the course	38	41	92.7	"1. Pleasant atmosphere 2. Enough space and time for us to express and share 3. teachers are all caring" "I appreciate the efforts paid by the lecturers. It was really well-prepared. And the class atmosphere was really pleasant" "The interactive activities. The use of other medias (video, /role play), Many spaces for students to think deeply in topic."
3) Comments on the lecturer(s)	23	41	56.1	"The lecturers are nice and cheerful as they gave us physical and mental support throughout the trip" "I think the lectures are helpful and joyful. The lecturers are well-prepared, kind and willing to communicate with us" "They are professional, friendly. Warm-hearted"
4) Areas for improvement	24	41	58.5	"Can involve more interaction and discussion" "More videos and specific strategies. Some contents in the course is a little bit abstract" "Schedule too tight (sometimes), lack of interaction between groups"

In Table 9, 40 out of 41 (97.56%) original metaphors were considered as positive. Among the derived items, 49 (96.08%) of them were coded as positive, with only 2 (3.92%) items were coded as negative. A total of 13 categories were generated after coding. The three categories as examples are listed below:

The first category was bought up by seven students. The metaphors in this category indicated that this course included a wealth of knowledge.

- Buffet: "the lessons are fruitful and interesting. I gained much knowledge and fun during the lesson. The lessons provided me with a large variety of knowledge regarding leadership and equip me with the knowledge to deal with the challenge I may face in the future."

Four students expressed similar meanings in the second category. This category mainly referred to the diverse background of participants.

- Melting pot: “the people attendants are from different backgrounds, all the diverse thinking patterns, languages and cultures come together, melt with each other, forming an unbelievably perfect class. Everyone learns something about who they are, what other culture is like as well as most importantly, now to be a service leader.”

The third one was mentioned by three students, referring to the happiness that could be created by using the knowledge learned from the course.

- Lollipop: “we may change someone's life by doing something out of kindness.”

Table 9. Categorization of the metaphors used by the participants to describe the course

Metaphors	Nature of the Metaphor					Number of Codes Derived from the Metaphor and Its Nature

Similar to the descriptors, 20 items of metaphors were selected randomly to test the intra-rater and inter-rater reliability. The intra-rater agreement coded by two separate coders at two-time points were 90% and 100%, and the inter-rater reliability coded independently by two extra coders were both 95%. The results of both descriptors and metaphors supported the observation that the “Service Leadership” course was beneficial to the majority of the participants.

DISCUSSION

This study examined the perceptions of 43 undergraduate participants from The Hong Kong Polytechnic University and Peking University on the intensive “Service Leadership” course. Several observations are consistent with the previous studies [43, 45]: the internal consistency of Course Evaluation Form is acceptable; the content, lecturers, and effectiveness of the program were significantly correlated. The findings based on the quantitative and qualitative data are overwhelmingly positive.

Both quantitative and qualitative findings showed that student participants notably benefited from the “Service Leadership” course. First, students’ communication skills and the ability to regulate emotions were promoted. Students strongly agreed that they have learned the knowledge about how to control and express emotions as well as how to cultivate compassion and care for others. They practiced these skills through the activities organized in the courses, such as role play and self-reflection, which were rarely employed in other

subjects. Second, the “Service Leadership” course strengthened the student participants’ responsibility and capacity of self-leadership. Majority of them stated that they learned how to meet the needs of self, others, and community. Third, the “Service Leadership” course enhanced their willingness for service. Even though it was the first time they heard about the concepts related to Service Leadership, they developed the sense of the core components as a service leader and how to best serve others in such a role. Last but not least, many student participants revealed that the course fostered their confidence and awareness to be a leader. The theory behind “Service Leadership” upholds that every person has the potential to make use of their strengths and become a leader during the collaboration [31]. It raises the students’ awareness of acknowledging their potential and helps them to understand that everyone can occupy a position of leadership in daily life.

The quantitative and qualitative research employed in the study are complementary. On one hand, the credibility of the study can be promoted [46]. Besides, the validity and reliability of the study have been tested, which provide the base for replication and generalization available in the future. Besides, Toomela [27] stated that the mix-method approach provides a deeper understanding of the information we encoded.

Unlike other leadership models, Service Leadership Model starts from self-leadership and ends with serving others and the systems. Service Leadership theory emphasizes on self-leadership as the primary condition before one can serve others and systems [47]. Benefits of developing self-leadership have been explored in literature. For example, Prussia and colleagues’ [48] study showed that self-leadership could promote academic achievement effectively through enhanced self-efficacy. Also, Dolbier, Soderstrom, and Steinhardt [49] found that self-leadership is positively related to higher psychological function and better health status.

Furthermore, in another study which the corporate employees were employed, they found that self-leadership has positive correlation with not only health (e.g., greater perceived wellness, less work stress) but also work outcomes (e.g., more efficiency communication, greater work satisfaction, higher quality management, better working relationship) [49]. Learning service leadership can contribute to adolescents’ academic performance and their future work. In other words, not only a short-term effect but also long-term influence can acquire from service leadership training.

On the other hand, the Service Leadership subject is dedicated to nurturing adolescents to be caring service leaders [50]. Caring thinking and behavior facilitate leaders’ personal development and self-actualization [51]. For the ones whom they lead, caring will inspire them to be more autonomous in their daily work [51]. For the communities, the social atmosphere, which is full of caring, respect, and love, will be established. Self, others, and systems all can be benefited from the caring behaviors. Everyone can be benefited from the Service Leadership subject. In short, the significance of developing and broadcasting Service Leadership subject is profound.

Nevertheless, the present study has several limitations. First, after students completed the rating scales in the course evaluation form, they may be reluctant or impatient to answer the for open-ended questions in the last part which aimed at assessing the same aspect. Second, the “Service Leadership” course conducted in the SOAR program was an intensive mode. Although the result of the intensive course was positive, we could study further whether the differences between the intensive conducted courses and regular schedule courses exist.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is based with permission on a paper adapted from a special issue published in the *International Journal of Child and Adolescent Health* 2020;13(2) issue.

ABSTRACT

To nurture service leaders of tomorrow and to help university students develop in a holistic manner, the “Service Leadership” subject was established at The Hong Kong Polytechnic University (PolyU). In this chapter we examine the impact of the subject offered in 2015/16 academic year using the client satisfaction approach. A total of 106 university students completed an evaluation form assessing perceived program, instructors and effectiveness quality. The students reported a positive view of the program in both semesters. As predicted, there were significant inter-relationships amongst program content, instructor quality, and perceived effectiveness. Regarding predictors of program benefits, program and instructor quality showed a significant impact. For overall satisfaction, perceived benefits was the only significant predictor. The findings strongly suggest that the subject could promote the development of service leadership in students.

INTRODUCTION

With Gross Domestic Product (GDP) in the service sector accounted for more than 93%, Hong Kong is fundamentally a service-oriented economy that has a percentage share of service sector much higher than other developed Asian economies [1]. Given the service sector has been the leading force of Hong Kong's economic growth, it is expected that it will continue to make a major economic contribution in the coming future [2]. After the handover of Hong Kong, there has been massive integration and collaboration with the fast-expanding Chinese market. For example, there is the development of the "Guangdong-Hong Kong-Macao Greater Bay Area" ("Greater Bay Area"), a major national strategy that sets new pursuit of Mainland China to unite the resources and unleash its full economic potential. The Greater Bay Area (GBA) includes nine municipalities in Guangdong Province and two Special Administrative Regions (i.e., Hong Kong and Macau). This area is fast growing and economically very active, which has a total population of around 70 million people and a total GDP of around US\$1.6 trillion in 2018 [3]. The joint cooperation platform highlighted the importance of giving completely distinctive strength of each of areas, elevating their role in the economic growth development, and building a globally competitive modern system.

With the launch of the Individual Visit Scheme under the Mainland China and Hong Kong Closer Economic Partnership Arrangement in July 2003, travelers from Mainland China permitted to visit Hong Kong for individual purposes, which has subsequently led to an explosive expansion in retail and tourism industries [4]. The scheme was implemented at different phases, with the first introduction at only 4 Guangdong cities and extended to cover 49 cities from 18 provinces. The number of total visitors to Hong Kong has increased tremendously in the past 15 years. The surge has led to a level that the number of visitors in Hong Kong alone surpassed the number of visitors in some countries. For example, Hong Kong provided warmth hospitality to 54.3 million tourists in 2013, compared to 31.1 million by the United Kingdom, 10.4 million by Japan, and 6.5 million by Australia. Meanwhile, the Mainland China tourists have a tendency to stay shorter and more frequent in Hong Kong and have a significantly higher level of average daily spending of HK\$3,593 than non-Mainland tourists of HK\$1,970 in 2013. It was estimated the scheme contribution to the Hong Kong economy in 2012 amounted to a total of HK\$26.1 million, 1.3% of the Hong Kong's GDP, and 114,280 in the number of jobs [4]. The change of policy has opened up a massive amount of employment opportunities in the service industry, which in some measure, supported the low unemployment rate sitting at 3.1 percent [5].

Despite the fact that unemployment rate at its record low in Hong Kong, the severe income and wealth inequality over the past years is growing recognition that moving up the ladder can be very challenging, suggesting most of the economy's income and wealth have been shifting to a small percentage of wealthy people and global corporations that have been accumulating assets and buying equities. Most societies that have prioritized economic growth have now reached a point where the disparity creates social tension and heightens the need for redistribution [6]. The phenomenon emerges not only in Hong Kong. The decline in mobility and growing inequality are also causing threats to the American dream in the United States [7]. Education is commonly considered as one of the known areas that can stop reinforcing inequalities generation to generation with its high correlation by increasing access to and improving the quality of education [8]. The higher education across developed

societies has substantially expanded in the last several decades. It is important that universities are ensuring the graduates have the knowledge and positive attributes that the evolving labor market needs. As in Hong Kong, the economy has presented both opportunities and challenges to the young people in entering the competitive labor market and having the chances of upward social mobility, which would typically opt for skilled and professional workers with good communication and management skills in leading and creating a society that thinks and innovates. In short, how to help university students to adapt to the challenges of the growing service economies is an important task for universities to achieve.

Besides the challenges of the changing service economies, young people in Hong Kong are also facing several other issues in their adolescence that might hinder them from bargaining for advantages in entering the competitive markets. For example, academic pressure in young people are particularly high in Hong Kong, and for those who cannot cope with academic pressure, they may have other mental health problems that required their attention, such as depression, anxiety, hopelessness, and even suicidal ideations [9]. Materialistic orientation has become an emerging issue among youth [10]. Contemporary young people in Hong Kong live in an age of material abundance that has led to many of them only targeted to get a step ahead in life and to accumulate wealth at an early age. According to the research by the Commission on Youth [11], 20% to 30% of Hong Kong adolescents had material orientations and agreed that they would use unethical ways to accumulate wealth. About 6.6% of high school students reported that they know classmates who are currently engaging in compensated dating [12, 13]. Adolescents and university students in Hong Kong were also described as egocentrism and a lack of social responsibilities and civic engagement [14]. Navigating the difficult job of teaching and the developmental challenges is certainly not an easy one, especially in Hong Kong. Along with the macro environment in society, there are many social obstacles from a global standpoint that are coming ahead of our younger generation.

Millennials, typically refer to individuals who were born between the early 1980s to the mid-1990s, are often being labeled as self-centered, unmotivated, and disrespectful [15]. This is a pivotal moment that Millennials are quickly advancing in their careers and taking leadership role inside of corporations, shifting from traditional leadership and hierarchical management style, and changing the work-life philosophies and company values along the way. The change is re-defining the power dynamics within organizations to a relatively flat culture and less bureaucracy where employees are empowered to contribute and make decisions through openness, collaboration, and transparency. Following the millennials are the Generation Z (i.e., a generation born between the mid-1990s to the early 2000s). Roughly speaking, these teenagers do not know life without internet and technology and about to start stepping onto universities around the world. It is undoubtedly that the world shall embrace and expect a different leadership outlook from Generation Z once they begin entering the workforce and taking up management roles in the future. Therefore, it is important that the universities are allocating and providing more resources in equipping and nurturing the next generation's competitiveness to become successful leader prior joining the labor force with a nearly seamless experience and in leading our society with social skills and social competence. The younger generation is not simply the future of tomorrow – they are the potential leaders of today. Leadership is never easy, especially in light of the enormous challenges coming after them.

With the aim of establishing and strengthening service leadership education to the undergraduates in Hong Kong, the Victor and William Fung Foundation and the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) collaborated to launch the Fung Service Leadership Initiative. Eight public universities receiving funding from the University Grants Committee joined the project. In each university, courses, programs, and related educational materials were developed to meet its objectives of taking a holistic approach for nurturing and enhancing our university students with leadership competencies and capabilities for the most competitive service leadership mentality and practices. According to Chung [16], A service leader is “a ready, willing and able, on-the-spot entrepreneur who possesses relevant task competencies and is judged by superiors, peers, subordinates, and followers to exhibit appropriate character strengths and a caring social disposition.” In a study of Shek and colleagues [17], they have highlighted 12 dimensions of leadership desirable qualities as “*service orientation (self and others), systems orientation (self, followers, habitat, and larger system), leadership competencies, moral character, caring disposition, personal qualities of a leader, everyone is (can be) a leader, self-leadership, the need for continuous improvement, mentoring followers, Chinese cultural values, and comprehensiveness and breadth of the model*” (p. 218). For The Hong Kong Polytechnic University (PolyU), researchers have developed both credit-bearing subjects as well as noncredit-bearing leadership training programs.
